4. Creating, deleting and modifying reports.
5. Creating, deleting and modifying points.
6. Creating, deleting and modifying programming including ability to edit control programs off-line.
7. Creating, deleting and modifying system graphics and other types of displays.
8. Adding DDC controllers and other network communication devices such as gateways and routers.
9. Adding operator workstations.
10. Performing DDC system checkout and diagnostic procedures.
11. Performing DDC controllers operation and maintenance procedures.
12. Performing operator workstation operation and maintenance procedures.
13. Configuring DDC system hardware including controllers, workstations, communication devices and I/O points.
14. Maintaining, calibrating, troubleshooting, diagnosing and repairing hardware.

15. Adjusting, calibrating and replacing DDC system components.

O. Training Content for System Managers and Administrators:

1. DDC system software maintenance and backups.
2. Uploading, downloading and off-line archiving of all DDC system software and databases.
3. Interface with Project-specific, third-party operator software.
4. Understanding password and security procedures.
5. Adding new operators and making modifications to existing operators.
6. Operator password assignments and modification.
7. Operator authority assignment and modification.
8. Workstation data segregation and modification.

P. Video of Training Sessions:

1. Provide a digital video and audio recording of each training session. Create a separate recording file for each session.
2. Stamp each recording file with training session number, session name and date.
3. Provide Owner with two copies of digital files on DVDs or flash drives for later reference and for use in future training.
4. Owner retains right to make additional copies for intended training purposes without having to pay royalties.

SECTION 230923.11 - CONTROL VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes control valves and actuators for DDC systems.

B. Related Requirements:

1. Section 078413 "Penetration Firestopping" for penetrations made in fire-rated assemblies.
2. Section 079219 "Acoustical Joint Sealants" for penetrations made in acoustically rated assemblies.
3. Section 230923 "Direct Digital Control (DDC) System for HVAC" control equipment and software, relays, electrical power devices, uninterruptible power supply units, wire, and cable.

1.3 DEFINITIONS

A. Cv: Design valve coefficient.

B. DDC: Direct-digital control.

C. NBR: Nitrile butadiene rubber.

D. PTFE: Polytetrafluoroethylene

E. RMS: Root-mean-square value of alternating voltage, which is the square root of the mean value of the square of the voltage values during a complete cycle.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product, including the following:

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Operating characteristics, electrical characteristics, and furnished accessories indicating process operating range, accuracy over range, control signal over range, default control signal with loss of power, calibration data specific to each unique application, electrical power requirements, and limitations of ambient operating environment, including temperature and humidity.

3. Product description with complete technical data, performance curves, and product specification sheets.
4. Installation, operation, and maintenance instructions, including factors affecting performance.

B. Shop Drawings:

1. Include plans, elevations, sections, and details.
2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.
4. Include diagrams for pneumatic signal and main air tubing.

1.5 DELEGATED-DESIGN SUBMITTAL:

1. Schedule and design calculations for control valves and actuators, including the following:

a. Flow at project design and minimum flow conditions.
b. Pressure differential drop across valve at project design flow condition.
c. Maximum system pressure differential drop (pump close-off pressure) across valve at project minimum flow condition.
d. Design and minimum control valve coefficient with corresponding valve position.
e. Maximum close-off pressure.
f. Leakage flow at maximum system pressure differential.
g. Torque required at worst case condition for sizing actuator.
h. Actuator selection indicating torque provided.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For control valves to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASME Compliance: Fabricate and label products to comply with ASME Boiler and Pressure Vessel Code where required by authorities having jurisdiction.

C. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to size products where indicated as delegated design.

D. Ground Fault: Products shall not fail due to ground fault condition when suitably grounded.

E. Environmental Conditions:

1. Provide electric control valve actuators, with protective enclosures satisfying the following minimum requirements unless more stringent requirements are indicated. Electric control valve actuators not available with integral enclosures, complying with requirements indicated, shall be housed in protective secondary enclosures.

    a. Hazardous Locations: Explosion-proof rating for condition.

F. Determine control valve sizes and flow coefficients by ISA 75.01.01.

G. Control valve characteristics and rangeability shall comply with ISA 75.11.01.

H. Selection Criteria:

1. Control valve shutoff classifications shall be FCI 70-2, Class IV or better unless otherwise indicated.
2. Valve pattern, three-way or straight through, shall be as indicated on Drawings.
3. Modulating straight-through pattern control valves shall have equal percentage flow-throttling characteristics unless otherwise indicated.
4. Modulating three-way pattern water valves shall have linear flow-throttling characteristics. The total flow through the valve shall remain constant regardless of the valve's position.
5. Modulating butterfly valves shall have linear or equal percentage flow-throttling characteristics.
6. Fail positions unless otherwise indicated:

    a. Chilled Water: Close.
    b. Heating Hot Water: Open.

7. Rotary-type control valves, such as ball and butterfly valves, shall have Cv falling between 65 and 75 degrees of valve full open position and minimum valve Cv between 15 and 25 percent of open position.
8. Selection shall consider viscosity, flashing, and cavitation corrections.
9. Valves shall have stable operation throughout full range of operation, from design to minimum Cv.
10. Minimum Cv shall be calculated at 10 percent of design flow, with a coincident pressure differential equal to the system design pump head.
11. In water systems, select modulating control valves at terminal equipment for a design Cv based on a pressure drop of 5 psig at design flow unless otherwise indicated.
12. Modulating valve sizes for steam service shall provide a pressure drop at design flow equal to lesser of the following:

    a. 50 percent of the valve inlet pressure.
    b. 50 percent of the absolute steam pressure at the valve inlet.

13. Two-position control valves shall be line size unless otherwise indicated.
14. In water systems, use ball- or globe-style control valves for two-position control for valves NPS 2 and smaller and butterfly style for valves larger than NPS 2.
15. In steam systems, use ball- or globe-style control valves regardless of size.

2.2 BALL-STYLE CONTROL VALVES

A. Ball Valves with Single Port and Characterized Disk:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Belimo Aircontrols (USA), Inc.
    b. Honeywell.
    c. Johnson Controls Inc.
    d. Or equal.

2. Pressure Rating for NPS 1 and Smaller: Nominal 600 WOG.
3. Pressure Rating for NPS 1-1/2 through NPS 2: Nominal 400 WOG.
4. Close-off Pressure: 200 psig.
5. Process Temperature Range: Zero to 212 deg F.
6. Body and Tail Piece: Cast bronze ASTM B61, ASTM B62, ASTM B584, or forged brass with nickel plating.
7. End Connections: Threaded (NPT) ends.
8. Ball: 300 series stainless steel.
9. Stem and Stem Extension:

    a. Material to match ball.
    b. Blowout-proof design.
    c. Sleeve or other approved means to allow valve to be opened and closed without damaging the insulation or the vapor barrier seal.

10. Ball Seats: Reinforced PTFE.
11. Stem Seal: Reinforced PTFE packing ring with a threaded packing ring follower to retain the packing ring under design pressure with the linkage removed. Alternative means, such as EPDM O-rings, are acceptable if an equivalent cycle endurance can be demonstrated by testing.
12. Flow Characteristic: Equal percentage.

B. Ball Valves with Two Ports and Characterized Disk:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Belimo Aircontrols (USA), Inc.
    b. Honeywell.
    c. Johnson Controls Inc.
    d. Or equal.

2. Pressure Rating for NPS 1 and Smaller: Nominal 600 WOG.
3. Pressure Rating for NPS 1-1/2 through NPS 2: Nominal 400 WOG.
4. Close-off Pressure: 200 psig.
5. Process Temperature Range: Zero to 212 deg F.

6. Body and Tail Piece: Cast bronze ASTM B61, ASTM B62, ASTM B584, or forged brass with nickel plating.
7. End Connections: Threaded (NPT) ends.
8. Ball: 300 series stainless steel.
9. Stem and Stem Extension:

    a. Material to match ball.
    b. Blowout-proof design.
    c. Sleeve or other approved means to allow valve to be opened and closed without damaging the insulation or the vapor barrier seal.

10. Ball Seats: Reinforced PTFE.
11. Stem Seal: Reinforced PTFE packing ring with a threaded packing ring follower to retain the packing ring under design pressure with the linkage removed. Alternative means, such as EPDM O-rings, are acceptable if an equivalent cycle endurance can be demonstrated by testing.
12. Flow Characteristics for A-Port: Equal percentage.
13. Flow Characteristics for B-Port: Modified for constant common port flow.

2.3 BUTTERFLY-STYLE CONTROL VALVES

A. Commercial-Grade, Two-Way Butterfly Valves:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Belimo Aircontrols (USA), Inc.
    b. Honeywell.
    c. Johnson Controls Inc.
    d. Or equal.

2. Performance:

    a. Bi-directional bubble tight shutoff at 250 psig.
    b. Comply with MSS SP-67 or MSS SP-68.
    c. Rotation: Zero to 90 degrees.
    d. Linear or modified equal percentage flow characteristic.

3. Body: Cast iron ASTM A126, Class B, ductile iron ASTM A536 or cast steel ASTM A216/A216M WCB fully lugged, suitable for mating to ASME B16.5 flanges.
4. Disc: 316 stainless steel.
5. Shaft: 316 or 17-4 PH stainless steel.
6. Seat: Reinforced EPDM or reinforced PTFE with retaining ring.
7. Shaft Bushings: Reinforced PTFE or stainless steel.
8. Replaceable seat, disc, and shaft bushings.
9. Corrosion-resistant nameplate indicating:

    a. Manufacturer's name, model number, and serial number.
    b. Body size.

c. Body and trim materials.
d. Flow arrow.

B. Commercial-Grade, Three-Way Butterfly Valves:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Belimo Aircontrols (USA), Inc.
b. Honeywell.
c. Johnson Controls Inc.
d. Or equal.

2. Arrangement: Two valves mated to a fabricated tee with interconnecting mechanical linkage.
3. Performance:

a. Bi-directional bubble tight shutoff at 250 psig.
b. Comply with MSS SP-67 or MSS SP-68.
c. Rotation: Zero to 90 degrees.
d. Linear or modified equal percentage flow characteristic.

4. Body: Cast iron ASTM A126, Class B, ductile iron ASTM A536 or cast steel ASTM A216/A216M WCB fully lugged, suitable for mating to ASME B16.5 flanges.
5. Disc: 316 stainless steel.
6. Shaft: 316 or 17-4 PH stainless steel.
7. Seat: Reinforced EPDM or reinforced PTFE seat with retaining ring.
8. Shaft Bushings: Reinforced PTFE or stainless steel.
9. Replaceable seat, disc, and shaft bushings.
10. Corrosion-resistant nameplate indicating:

a. Manufacturer's name, model number, and serial number.
b. Body size.
c. Body and trim materials.
d. Flow arrow.

2.4 ELECTRIC AND ELECTRONIC CONTROL VALVE ACTUATORS

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Belimo Aircontrols (USA), Inc.
b. Honeywell.
c. Johnson Controls Inc.
d. Or equal.

B. Actuators for Hydronic Control Valves: Capable of closing valve against system pump shutoff head.

C. Position indicator and graduated scale on each actuator.

D. Type: Motor operated, with or without gears, electric and electronic.

E. Voltage: Voltage selection delegated to professional designing control system 24-V ac.

F. Deliver torque required for continuous uniform movement of controlled device from limit to limit when operated at rated voltage.

G. Function properly within a range of 85 to 120 percent of nameplate voltage.

H. Construction:

1. For Actuators Less Than 100 W: Fiber or reinforced nylon gears with steel shaft, copper alloy or nylon bearings, and pressed steel enclosures.
2. For Actuators from 100 to 400 W: Gears ground steel, oil immersed, shaft hardened steel running in bronze, copper alloy or ball bearings. Operator and gear trains shall be totally enclosed in dustproof cast-iron, cast-steel or cast-aluminum housing.
3. For Actuators Larger Than 400 W: Totally enclosed reversible induction motors with auxiliary hand crank and permanently lubricated bearings.

I. Field Adjustment:

1. Spring Return Actuators: Easily switchable from fail open to fail closed in the field without replacement.
2. Gear Type Actuators: External manual adjustment mechanism to allow manual positioning when the actuator is not powered.

J. Two-Position Actuators: Single direction, spring return or reversing type.

K. Modulating Actuators:

1. Operation: Capable of stopping at all points across full range, and starting in either direction from any point in range.
2. Control Input Signal:

a. Proportional: Actuator drives proportional to input signal and modulates throughout its angle of rotation. Suitable for zero-10 or 2-10-V dc and 4-20-mA signals.

L. Position Feedback:

1. Where indicated, equip two-position actuators with limits switches or other positive means of a position indication signal for remote monitoring of open and close position.
2. Where indicated, equip modulating actuators with a position feedback through current or voltage signal for remote monitoring.
3. Provide a position indicator and graduated scale on each actuator indicating open and closed travel limits.

M. Fail-Safe:

1. Where indicated, provide actuator to fail to an end position.

2. Internal spring return mechanism to drive controlled device to an end position (open or close) on loss of power.
3. Batteries, capacitors, and other non-mechanical forms of fail-safe operation are acceptable only where uniquely indicated.

N. Integral Overload Protection:

1. Provide against overload throughout the entire operating range in both directions.
2. Electronic overload, digital rotation sensing circuitry, mechanical end switches, or magnetic clutches are acceptable methods of protection.

O. Valve Attachment:

1. Unless otherwise required for valve interface, provide an actuator designed to be directly coupled to valve shaft without the need for connecting linkages.
2. Attach actuator to valve drive shaft in a way that ensures maximum transfer of power and torque without slippage.
3. Bolt and set screw method of attachment is acceptable only if provided with at least two points of attachment.

P. Temperature and Humidity:

1. Temperature: Suitable for operating temperature range encountered by application with minimum operating temperature range of minus 20 to plus 120 deg F.
2. Humidity: Suitable for humidity range encountered by application; minimum operating range shall be from 5 to 95 percent relative humidity, non-condensing.

Q. Enclosure:

1. Suitable for ambient conditions encountered by application.
2. NEMA 250, Type 2 for indoor and protected applications.
3. NEMA 250, Type 4 or Type 4X for outdoor and unprotected applications.
4. Provide actuator enclosure with heater and control where required by application.

R. Stroke Time:

1. Operate valve from fully closed to fully open within 90 seconds.
2. Operate valve from fully open to fully closed within 90 seconds.
3. Move valve to failed position within 30 seconds.
4. Select operating speed to be compatible with equipment and system operation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for valves installed in piping to verify actual locations of piping connections before installation.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CONTROL VALVE APPLICATIONS

1. Select from valves specified in "Control Valves" Article to achieve performance requirements and characteristics indicated while subjected to full range of system operation encountered.

3.3 INSTALLATION, GENERAL

A. Furnish and install products required to satisfy most stringent requirements indicated.

B. Install products level, plumb, parallel, and perpendicular with building construction.

C. Properly support instruments, tubing, piping, wiring, and conduits to comply with requirements indicated. Brace all products to prevent lateral movement and sway or a break in attachment when subjected to a 5 pound force.

D. Provide ceiling, floor, roof, and wall openings and sleeves required by installation. Before proceeding with drilling, punching, or cutting, check location first for concealed products that could potentially be damaged. Patch, flash, grout, seal, and refinish openings to match adjacent condition.

E. Firestop penetrations made in fire-rated assemblies and seal penetrations made in acoustically rated assemblies.

F. Fastening Hardware:

1. Stillson wrenches, pliers, and other tools that will cause injury to or mar surfaces of rods, nuts, and other parts are prohibited for assembling and tightening nuts.
2. Tighten bolts and nuts firmly and uniformly. Do not overstress threads by excessive force or by oversized wrenches.
3. Lubricate threads of bolts, nuts, and screws with graphite and oil before assembly.

G. Install products in locations that are accessible and that will permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.

H. Corrosive Environments:

1. Use products that are suitable for environment to which they will be subjected.
2. If possible, avoid or limit use of materials in corrosive environments, including. but not limited to, the following:

a. Laboratory exhaust airstreams.
b. Process exhaust airstreams.

3. Use Type 316 stainless-steel tubing and fittings when in contact with a corrosive environment.
4. When conduit is in contact with a corrosive environment, use Type 316 stainless-steel conduit and fittings or conduit and fittings that are coated with a corrosive-resistant coating that is suitable for environment.
5. Where control devices are located in a corrosive environment and are not corrosive resistant from manufacturer, field install products in a NEMA 250, Type 4X enclosure constructed of Type 316L stainless steel.

3.4 ELECTRIC POWER

A. Furnish and install electrical power to products requiring electrical connections.

B. Furnish and install circuit breakers. Comply with requirements in Section 262816 "Enclosed Switches and Circuit Breakers."

C. Furnish and install power wiring. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

D. Furnish and install raceways. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems."

3.5 CONTROL VALVES

A. Install pipe reducers for valves smaller than line size. Position reducers as close to valve as possible but at distance to avoid interference and impact to performance. Install with manufacturer-recommended clearance.

B. Install flanges or unions to allow drop-in and -out valve installation.

C. Where indicated, install control valve with three-valve bypass manifold to allow for control valve isolation and removal without interrupting system flow by providing manual throttling valve in bypass pipe.

D. Install drain valves in piping upstream and downstream of each control valve installed in a three-valve manifold and for each control valve larger than NPS 2.

E. Install pressure temperature taps in piping upstream and downstream of each control valve larger than NPS 2.

F. Valve Orientation:

1. Where possible, install globe and ball valves installed in horizontal piping with stems upright and not more than 15 degrees off of vertical, not inverted.
2. Install valves in a position to allow full stem movement.
3. Where possible, install butterfly valves that are installed in horizontal piping with stems in horizontal position and with low point of disc opening with direction of flow.

G. Clearance:

1. Locate valves for easy access and provide separate support of valves that cannot be handled by service personnel without hoisting mechanism.
2. Install valves with at least 12 inches of clear space around valve and between valves and adjacent surfaces.

H. Threaded Valves:

1. Note internal length of threads in valve ends, and proximity of valve internal seat or wall, to determine how far pipe should be threaded into valve.
2. Align threads at point of assembly.
3. Apply thread compound to external pipe threads, except where dry seal threading is specified.
4. Assemble joint, wrench tight. Apply wrench on valve end as pipe is being threaded.

I. Flanged Valves:

1. Align flange surfaces parallel.
2. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly with a torque wrench.

3.6 CONNECTIONS

A. Connect electrical devices and components to electrical grounding system. Comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."

3.7 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Each piece of wire, cable, and tubing shall have the same designation at each end for operators to determine continuity at points of connection. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Install engraved phenolic nameplate with valve identification on valve.

3.8 CLEANING

A. Remove grease, mastic, adhesives, dust, dirt, stains, fingerprints, labels, and other foreign materials from exposed interior and exterior surfaces.

B. Wash and shine glazing.

C. Polish glossy surfaces to a clean shine.

3.9 CHECKOUT PROCEDURES

A. Control Valve Checkout:

1. Check installed products before continuity tests, leak tests, and calibration.
2. Check valves for proper location and accessibility.
3. Check valves for proper installation for direction of flow, elevation, orientation, insertion depth, or other applicable considerations that will impact performance.
4. Verify that control valves are installed correctly for flow direction.
5. Verify that valve body attachment is properly secured and sealed.
6. Verify that valve actuator and linkage attachment are secure.
7. Verify that actuator wiring is complete, enclosed, and connected to correct power source.
8. Verify that valve ball, disc, and plug travel are unobstructed.
9. After piping systems have been tested and put into service, but before insulating and balancing, inspect each valve for leaks. Adjust or replace packing to stop leaks. Replace the valve if leaks persist.

3.10 ADJUSTMENT, CALIBRATION, AND TESTING

A. Stroke and adjust control valves following manufacturer's recommended procedure, from 100 percent open to 100 percent closed back to 100 percent open.

B. Stroke control valves with pilot positioners. Adjust valve and positioner following manufacturer's recommended procedure, so valve is 100 percent closed, 50 percent closed, and 100 percent open at proper air pressures.

C. Check and document open and close cycle times for applications with a cycle time of less than 30 seconds.

D. For control valves equipped with positive position indication, check feedback signal at multiple positions to confirm proper position indication.

SECTION 230923.12 - CONTROL DAMPERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the following types of control dampers and actuators for DDC systems:

1. Rectangular control dampers.
2. General control-damper actuator requirements.
3. Electric and electronic actuators.
4. Delegated Design.

B. Related Requirements:

1. Section 078413 "Penetration Firestopping" for penetrations made in fire-rated assemblies.
2. Section 079219 "Acoustical Joint Sealants" for penetrations made in acoustically rated assemblies.
3. Section 230923 "Direct-Digital Control System for HVAC" for control equipment and software, relays, electrical power devices, uninterruptible power supply units, wire, and cable.

1.3 DEFINITIONS

A. DDC: Direct-digital control.

B. RMS: Root-mean-square value of alternating voltage, which is the square root of the mean value of the square of the voltage values during a complete cycle.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product, including the following:

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Operating characteristics, electrical characteristics, and furnished accessories indicating process operating range, accuracy over range, control signal over range, default control signal with loss of power, calibration data specific to each unique application, electrical power requirements, and limitations of ambient operating environment, including temperature and humidity.

3. Product description with complete technical data, performance curves, and product specification sheets.
4. Installation instructions, including factors affecting performance.

B. Shop Drawings:

1. Include plans, elevations, sections, and details.
2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.
4. Include diagrams for air and process signal tubing.
5. Include diagrams for pneumatic signal and main air tubing.

1.5 DELEGATED DESIGN SUBMITTALS

A. Schedule and design calculations for control dampers and actuators, including the following.

1. Flow at project design and minimum flow conditions.
2. Face velocity at project design and minimum airflow conditions.
3. Pressure drop across damper at project design and minimum airflow conditions.
4. AMCA 500D damper installation arrangement used to calculate and schedule pressure drop, as applicable to installation.
5. Maximum close-off pressure.
6. Leakage airflow at maximum system pressure differential (fan close-off pressure).
7. Torque required at worst case condition for sizing actuator.
8. Actuator selection indicating torque provided.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For control dampers to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASME Compliance: Fabricate and label products to comply with ASME Boiler and Pressure Vessel Code where required by authorities having jurisdiction.

C. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to size products where indicated as delegated design.

D. Ground Fault: Products shall not fail due to ground fault condition when suitably grounded.

E. Backup Power Source: Systems and equipment served by a backup power source shall have associated control damper actuators served from a backup power source.

F. Environmental Conditions:

1. Provide electric control-damper actuators, with protective enclosures satisfying the following minimum requirements unless more stringent requirements are indicated. Electric control-damper actuators not available with integral enclosures, complying with requirements indicated, shall be housed in protective secondary enclosures.

a. Hazardous Locations: Explosion-proof rating for condition.

G. Selection Criteria:

1. Control dampers shall be suitable for operation at following conditions:

a. Supply Air: 3 inches water column.
b. Return Air: 3 inches water column .
c. Outdoor Air: 3 inches water column .
d. Mixed Air: 3 inches water column .
e. Exhaust Air: 3 inches water column .

2. Fail positions unless otherwise indicated:

a. Supply Air: Close.
b. Return Air: Open.
c. Outdoor Air: Close.
d. Exhaust Air: Close.

3. Dampers shall have stable operation throughout full range of operation, from design to minimum airflow over varying pressures and temperatures encountered.
4. Select modulating dampers for a pressure drop of 2 percent of fan total static pressure unless otherwise indicated.
5. Two-position dampers shall be full size of duct or equipment connection unless otherwise indicated.

2.2 RECTANGULAR CONTROL DAMPERS

A. General Requirements:

1. Unless otherwise indicated, use parallel blade configuration for two-position control, equipment isolation service, and when mixing two airstreams. For other applications, use opposed blade configuration.
2. Factory assemble multiple damper sections to provide a single damper assembly of size required by the application.
3. Damper actuator shall be factory installed by damper manufacturer as integral part of damper assembly. Coordinate actuator location and mounting requirements with damper manufacturer.

B. Rectangular Dampers with Aluminum Airfoil Blades:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Greenheck.
    b. Pottorff.
    c. Ruskin Company.
    d. Or equal.

C. Requirements in subparagraphs below are based on Ruskin's "CD50 series."

1. Performance:

    a. Leakage: AMCA 511, Class 1A. Leakage shall not exceed 3 cfm/sq. ft. against 1-inch wg differential static pressure.
    b. Pressure Drop: 0.05-inch wg at 1500 fpm across a 24-by-24-inch damper when tested according to AMCA 500-D, figure 5.3.
    c. Velocity: Up to 6000 fpm.
    d. Temperature: Minus 40 to plus 185 degrees F.
    e. Pressure Rating: Damper close-off pressure equal to fan shutoff pressure with a maximum blade deflection of 1/200 of blade length.
    f. Damper shall have AMCA seal for both air leakage and air performance.

2. Construction:

    a. Frame:

        1) Material: ASTM B 211, Alloy 6063 T5 extruded-aluminum profiles, 0.07 inch thick.
        2) Hat-shaped channel with integral flange(s). Mating face shall be a minimum of 1 inch.
        3) Width not less than 5 inches.

    b. Blades:

        1) Hollow, airfoil, extruded aluminum.
        2) Parallel or opposed blade configuration as required by application.
        3) Material: ASTM B 211, Alloy 6063 T5 aluminum, 0.07 inch thick.
        4) Width not to exceed 6 inches.
        5) Length as required by close-off pressure, not to exceed 48 inches.

    c. Seals:

        1) Blades: Replaceable, mechanically attached extruded silicone, vinyl, or plastic composite.
        2) Jambs: Stainless steel, compression type.

    d. Axles: 0.5-inch- diameter stainless steel, mechanically attached to blades.
    e. Bearings:

        1) Molded synthetic or stainless-steel sleeve mounted in frame.

2) Where blade axles are installed in vertical position, provide thrust bearings.

f. Linkage:

1) Concealed in frame.
2) Constructed of aluminum and stainless steel.
3) Hardware: Stainless steel.

g. Transition:

1) For round and flat oval duct applications, provide damper assembly with integral transitions to mate to adjoining field connection.
2) Factory mount damper in a sleeve with a close transition to mate to field connection.
3) Damper size and sleeve shall be connection size plus 2 inches.
4) Sleeve length shall be not less than 12 inches for dampers without jackshafts and shall be not less than 16 inches for dampers with jackshafts.
5) Sleeve material shall match adjacent duct.

h. Additional Corrosion Protection:

1) Provide anodized finish for aluminum surfaces in contact with airstream. Anodized finish shall be a minimum of 0.0007 inch thick.
2) Axles, damper linkage, and hardware shall be constructed of Type 316L stainless steel.

2.3 GENERAL CONTROL-DAMPER ACTUATORS REQUIREMENTS

A. Actuators shall operate related damper(s) with sufficient reserve power to provide smooth modulating action or two-position action and proper speed of response at velocity and pressure conditions to which the damper is subjected.

B. Actuators shall produce sufficient power and torque to close off against the maximum system pressures encountered. Actuators shall be sized to close off against the fan shutoff pressure as a minimum requirement.

C. The total damper area operated by an actuator shall not exceed 80 percent of manufacturer's maximum area rating.

D. Provide one actuator for each damper assembly where possible. Multiple actuators required to drive a single damper assembly shall operate in unison.

E. Avoid the use of excessively oversized actuators which could overdrive and cause linkage failure when the damper blade has reached either its full open or closed position.

F. Use jackshafts and shaft couplings in lieu of blade-to-blade linkages when driving axially aligned damper sections.

G. Provide mounting hardware and linkages for connecting actuator to damper.

H. Select actuators to fail in desired position in the event of a power failure.

2.4 ELECTRIC AND ELECTRONIC ACTUATORS

A. Type: Motor operated, with or without gears, electric and electronic.

B. Voltage:

1. 24 V.
2. Actuator shall deliver torque required for continuous uniform movement of controlled device from limit to limit when operated at rated voltage.
3. Actuator shall function properly within a range of 85 to 120 percent of nameplate voltage.

C. Construction:

1. Less Than 100 W: Fiber or reinforced nylon gears with steel shaft, copper alloy or nylon bearings, and pressed steel enclosures.
2. 100 up to 400 W: Gears ground steel, oil immersed, shaft-hardened steel running in bronze, copper alloy, or ball bearings. Operator and gear trains shall be totally enclosed in dustproof cast-iron, cast-steel, or cast-aluminum housing.
3. Greater Than 400 W: Totally enclosed reversible induction motors with auxiliary hand crank and permanently lubricated bearings.

D. Field Adjustment:

1. Spring return actuators shall be easily switchable from fail open to fail closed in the field without replacement.
2. Provide gear-type actuators with an external manual adjustment mechanism to allow manual positioning of the damper when the actuator is not powered.

E. Two-Position Actuators: Single direction, spring return or reversing type.

F. Modulating Actuators:

1. Capable of stopping at all points across full range, and starting in either direction from any point in range.
2. Control Input Signal:

    a. Proportional: Actuator drives proportional to input signal and modulates throughout its angle of rotation. Suitable for zero- to 10- or 2- to 10-V dc and 4- to 20-mA signals.

G. Position Feedback:

1. Where indicated, equip two-position actuators with limits switches or other positive means of a position indication signal for remote monitoring of open and close position.
2. Where indicated, equip modulating actuators with a position feedback through current or voltage signal for remote monitoring.
3. Provide a position indicator and graduated scale on each actuator indicating open and closed travel limits.

H. Fail-Safe:

1. Where indicated, provide actuator to fail to an end position.
2. Internal spring return mechanism to drive controlled device to an end position (open or close) on loss of power.
3. Batteries, capacitors, and other non-mechanical forms of fail-safe operation are acceptable only where uniquely indicated.

I. Integral Overload Protection:

1. Provide against overload throughout the entire operating range in both directions.
2. Electronic overload, digital rotation sensing circuitry, mechanical end switches, or magnetic clutches are acceptable methods of protection.

J. Damper Attachment:

1. Unless otherwise required for damper interface, provide actuator designed to be directly coupled to damper shaft without need for connecting linkages.
2. Attach actuator to damper drive shaft in a way that ensures maximum transfer of power and torque without slippage.
3. Bolt and set screw method of attachment is acceptable only if provided with at least two points of attachment.

K. Temperature and Humidity:

1. Temperature: Suitable for operating temperature range encountered by application with minimum operating temperature range of minus 20 to plus 120 degrees F.
2. Humidity: Suitable for humidity range encountered by application; minimum operating range shall be from 5 to 95 percent relative humidity, non-condensing.

L. Enclosure:

1. Suitable for ambient conditions encountered by application.
2. NEMA 250, Type 2 for indoor and protected applications.
3. NEMA 250, Type 4 or Type 4X for outdoor and unprotected applications.
4. Provide actuator enclosure with a heater and controller where required by application.

M. Stroke Time:

1. Operate damper from fully closed to fully open within 90 seconds.
2. Operate damper from fully open to fully closed within 90 seconds.
3. Move damper to failed position within 30 seconds.
4. Select operating speed to be compatible with equipment and system operation.
5. Actuators operating in smoke control systems comply with governing code and NFPA requirements.

All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for dampers and instruments installed in duct systems to verify actual locations of connections before installation.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Provide products required to satisfy most stringent requirements indicated.

B. Properly support dampers and actuators, tubing, wiring, and conduit to comply with requirements indicated. Brace all products to prevent lateral movement and sway or a break in attachment when subjected to a 5 pound force.

C. Provide ceiling, floor, roof, and wall openings and sleeves required by installation. Before proceeding with drilling, punching, or cutting, check location first for concealed products that could potentially be damaged. Patch, flash, grout, seal, and refinish openings to match adjacent condition.

D. Seal penetrations made in fire-rated and acoustically rated assemblies.

E. Fastening Hardware:

1. Stillson wrenches, pliers, or other tools that will cause injury to or mar surfaces of rods, nuts, and other parts are prohibited for assembling and tightening nuts.
2. Tighten bolts and nuts firmly and uniformly. Do not overstress threads by excessive force or by oversized wrenches.
3. Lubricate threads of bolts, nuts, and screws with graphite and oil before assembly.

F. Install products in locations that are accessible and that will permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.

3.3 ELECTRIC POWER

A. Provide electrical power to products requiring electrical connections.

B. Provide circuit breakers. Comply with requirements in Section 262816 "Enclosed Switches and Circuit Breakers."

C. Provide power wiring. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

D. Provide raceways. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems."

3.4 CONTROL DAMPERS

A. Install smooth transitions, not exceeding 30 degrees, to dampers smaller than adjacent duct. Install transitions as close to damper as possible but at distance to avoid interference and impact to performance. Consult manufacturer for recommended clearance.

B. Clearance:

1. Locate dampers for easy access and provide separate support of dampers that cannot be handled by service personnel without hoisting mechanism.
2. Install dampers with at least 24 inches of clear space on sides of dampers requiring service access.

C. Service Access:

1. Dampers and actuators shall be accessible for visual inspection and service.
2. Install access door(s) in duct or equipment located upstream of damper to allow service personnel to hand clean any portion of damper, linkage, and actuator. Comply with requirements in Section 233300 "Air Duct Accessories."

D. Install dampers straight and true, level in all planes, and square in all dimensions. Install supplementary structural steel reinforcement for large multiple-section dampers if factory support alone cannot handle loading.

E. Attach actuator(s) to damper drive shaft.

F. For duct-mounted and equipment-mounted dampers installed outside of equipment, install a visible and accessible indication of damper position from outside.

3.5 CONNECTIONS

A. Connect electrical devices and components to electrical grounding system. Comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."

3.6 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Each piece of wire, cable, and tubing shall have the same designation at each end for operators to determine continuity at points of connection. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Install engraved phenolic nameplate with damper identification on damper.

© 2026 CDM Smith
All Rights Reserved

3.7 CHECKOUT PROCEDURES

A. Control-Damper Checkout:

1. Check installed products before continuity tests, leak tests, and calibration.
2. Check dampers for proper location and accessibility.
3. Verify that control dampers are installed correctly for flow direction.
4. Verify that proper blade alignment, either parallel or opposed, has been provided.
5. Verify that damper frame attachment is properly secured and sealed.
6. Verify that damper actuator and linkage attachment are secure.
7. Verify that actuator wiring is complete, enclosed, and connected to correct power source.
8. Verify that damper blade travel is unobstructed.

3.8 ADJUSTMENT, CALIBRATION, AND TESTING:

A. Stroke and adjust control dampers following manufacturer's recommended procedure, from 100 percent open to 100 percent closed back to 100 percent open.

B. Stroke control dampers with pilot positioners. Adjust damper and positioner following manufacturer's recommended procedure, so damper is 100 percent closed, 50 percent closed, and 100 percent open at proper air pressure.

C. Check and document open and close cycle times for applications with a cycle time of less than 30 seconds.

D. For control dampers equipped with positive position indication, check feedback signal at multiple positions to confirm proper position indication.

SECTION 230923.23 - PRESSURE INSTRUMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Air-pressure switches.
2. Liquid-pressure transmitters.

B. Related Requirements:

1. Section 230923 "Direct-Digital Control System for HVAC" for control equipment and software, relays, electrical power devices, uninterruptible power supply units, wire, and cable.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product, including the following:

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Operating characteristics; electrical characteristics; and furnished accessories indicating process operating range, accuracy over range, control signal over range, default control signal with loss of power, calibration data specific to each unique application, electrical power requirements, and limitations of ambient operating environment, including temperature and humidity.
3. Product description with complete technical data, performance curves, and product specification sheets.
4. Installation instructions, including factors affecting performance.

B. Shop Drawings:

1. Include plans, elevations, sections, anddetails.
2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Number-coded identification system for unique identification of wiring, cable, and tubing ends.

© 2026 CDM Smith
All Rights Reserved

1.4 INFORMATIONAL SUBMITTALS

A. Source quality-control reports.

B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For instruments to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Environmental Conditions:

1. Instruments shall operate without performance degradation under the ambient environmental temperature, pressure, humidity, and vibration conditions specified and encountered for installed location.

a. If instrument alone cannot comply with requirement, install instrument in a protective enclosure that is isolated and protected from conditions impacting performance. Enclosure shall be internally insulated, electrically heated, filtered, and ventilated as required by instrument and application.

2. Instruments and accessories shall be protected with enclosures satisfying the following minimum requirements unless more stringent requirements are indicated. Instruments not available with integral enclosures complying with requirements indicated shall be housed in protective secondary enclosures. Instrument-installed location shall dictate following NEMA 250 enclosure requirements:

a. Outdoors: Type 4X.
b. Indoors, Mezzanine Level: Type 1.
c. Indoors, Ground Floor: Type 1.
d. Indoors below Ground Floor: Type 4X.

2.2 AIR-PRESSURE SWITCHES

A. Air-Pressure Differential Switch:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Cleveland Controls Inc.
b. Dwyer Instruments, Inc.
c. Johnson Controls, Inc.

d. Penn Controls.

2. Diaphragm operated to actuate an DPDT snap switch.
3. Electrical Connections: Three-screw configuration, including one screw for common operation and two screws for field-selectable normally open or closed operation.
4. Enclosure Conduit Connection: Knock out or threaded connection.
5. User Interface: Screw-type set-point adjustment located inside removable enclosure cover.
6. High and Low Process Connections: Threaded, NPS 1/8.
7. Enclosure: NEMA 250, Type 4.
8. Operating Data:

   a. Electrical Rating: 15 A at 120- to 480-V ac.
   b. Pressure Limits:

      1) Continuous: 45 inches wg.
      2) Surge: 10 psig.

   c. Temperature Limits: Minus 30 to 180 deg F.
   d. Operating Range: Approximately 2 times set point.
   e. Repeatability: Within 3 percent.
   f. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 LIQUID-PRESSURE TRANSMITTERS

A. Liquid-Pressure Differential Transmitter:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

   a. Dwyer Instruments, Inc.
   b. Setra Systems Inc.

2. Performance:

   a. Range: Approximately 2 times set point.
   b. Span: Adjustable plus or minus one milliamp, noninteractive.
   c. Accuracy: Within 0.25 percent of full scale.
   d. Pressure: Maximum operating pressure 2.5 times range.
   e. Temperature Limits: Zero to 175 deg F.
   f. Compensate Temperature Limits: 30 to 150 deg F.
   g. Thermal Effects: 0.02 percent of full scale per degree F.
   h. Response Time: 30 to 50 ms.
   i. Shock and vibration shall not harm the transmitter.

3. Analog Output Current Signal:

   a. Two-wire, 4- to 20-mA dc current source.

b. Signal capable of operating into 1000-ohm load.

4. Operator Interface:

a. Zero and span adjustments located behind cover.
b. Bleed screws on side of body, two screws on low-pressure side, and one screw on high-pressure side, for air in line and pressure cavity.

5. Construction:

a. Aluminum and stainless-steel enclosure with removable cover.
b. Wetted parts of transmitter constructed of 17-4 PH or 300 Series stainless steel.
c. Threaded, NPS 1/4 process connections on side of instrument enclosure.
d. Knock out for 1/2-inch nominal conduit connection on side of instrument enclosure.
e. Screw terminal block for wire connections.
f. NEMA 250, Type 4X.
g. Mounting Bracket: Appropriate for installation.

6. Three-valve manifold. Construct manifold of brass, bronze, or stainless steel. Manifold shall have threaded, NPS 1/4 process connections.

2.4 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect assembled pressure instruments, as indicated by instrument requirements. Affix standards organization's certification and label.

B. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for instruments installed in piping to verify actual locations of connections before installation.

C. Examine roughing-in for instruments installed in duct systems to verify actual locations of connections before installation.

D. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Install products level, plumb, parallel, and perpendicular with building construction.

B. Properly support instruments, tubing, piping wiring, and conduit to comply with requirements indicated. Brace all products to prevent lateral movement, sway, or a break in attachment when subjected to a 5 pound force.

C. Provide ceiling, floor, roof, wall openings, and sleeves required by installation. Before proceeding with drilling, punching, or cutting, check location first for concealed products that could potentially be damaged. Patch, flash, grout, seal, and refinish openings to match adjacent condition.

D. Fastening Hardware:

1. Stillson wrenches, pliers, and other tools that cause injury to or mar surfaces of rods, nuts, and other parts are prohibited for work of assembling and tightening nuts.
2. Tighten bolts and nuts firmly and uniformly. Do not to overstress threads by using excessive force or oversized wrenches.
3. Lubricate threads of bolts, nuts, and screws with graphite and oil before assembly.

E. Install products in locations that are accessible and that permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.

F. Corrosive Environments:

1. Use products that are suitable for environment to which they are subjected.
2. If possible, avoid or limit use of materials in corrosive environments.
3. When conduit is in contact with a corrosive environment, use Type 316 stainless-steel conduit and fittings or conduit and fittings that are coated with a corrosive-resistant coating that is suitable for environment.
4. Where instruments are located in a corrosive environment and are not corrosive resistant from the manufacturer, field install products in a NEMA 250, Type 4X enclosure constructed of Type 316L stainless steel.

3.3 ELECTRICAL POWER

A. Furnish and install electrical power to products requiring electrical connections.

B. Furnish and install circuit breakers. Comply with requirements in Section 262816 "Enclosed Switches and Circuit Breakers."

C. Furnish and install power wiring. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

D. Furnish and install raceways. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems."

3.4 PRESSURE INSTRUMENT INSTALLATION

A. Mounting Location:

1. Rough-in: Outline instrument-mounting locations before setting instruments and routing, cable, wiring, tubing, and conduit to final location.
2. Install switches and transmitters for air and liquid pressure associated with individual air-handling units and associated connected ductwork and piping near air-handlings units co-located in air-handling unit system control panel, to provide service personnel a single and convenient location for inspection and service.
3. Install liquid and steam pressure switches and transmitters for indoor applications in mechanical equipment rooms. Do not locate in user-occupied space unless indicated specifically on Drawings.
4. Install air-pressure switches and transmitters for indoor applications in mechanical equipment rooms. Do not locate in user-occupied space unless indicated specifically on Drawings.
5. Mount switches and transmitters not required to be mounted within system control panels on walls, floor-supported freestanding pipe stands, or floor-supported structural support frames. Use manufacturer mounting brackets to accommodate field mounting. Securely support and brace products to prevent vibration and movement.
6. Install instruments (except pressure gages) in steam, liquid, and liquid-sealed piped services below their process connection point. Slope tubing down to instrument with a slope of 2 percent.
7. Install instruments in dry gas and noncondensable vapor piped services above their process connection point. Slope process connection lines up to instrument with a minimum slope of 2 percent.

B. Seal penetrations to ductwork, plenums, and air-moving equipment to comply with duct static pressure class and leakage and seal classes indicated using neoprene gaskets or grommets.

C. Duct Pressure Sensors:

1. Install sensors using manufacturer's recommended upstream and downstream distances.
2. Unless indicated on Drawings, locate sensors approximately 50 percent of distance of longest hydraulic run. Location of sensors shall be submitted and approved before installation.
3. Install mounting hardware and gaskets to make sensor installation airtight.
4. Route tubing from the sensor to transmitter.
5. Use compression fittings at terminations.
6. Install sensor in accordance with manufacturer's instructions.
7. Support sensor to withstand maximum air velocity, turbulence, and vibration encountered to prevent instrument failure.

D. Air-Pressure Differential Switches:

1. Install air-pressure sensor in system for each switch connection. Install sensor in an accessible location for inspection and replacement.
2. A single sensor may be used to share a common signal to multiple pressure instruments.
3. Install access door in duct and equipment to access sensors that cannot be inspected and replaced from outside.
4. Route NPS 3/8 tubing from sensor to switch connection.

5. Do not mount switches on rotating equipment.
6. Install switches in a location free from vibration, heat, moisture, or adverse effects, which could damage the switch and hinder accurate operation.
7. Install switches in an easily accessible location serviceable from floor.
8. Install switches adjacent to system control panel if within 50 feet; otherwise, locate switch in vicinity of system connection.

E. Liquid-Pressure Transmitters:

1. Where process connections are installed in mechanical equipment room, install transmitter in convenient and accessible location near system control panel.
2. Where process connections are installed outside mechanical rooms, route processing tubing to mechanical room housing system control panel and locate transmitter near system control panel.
3. Where multiple transmitters serving same system are installed in same room, install transmitters by system to provide service personnel a single and convenient location for inspection and service.
4. System process tubing connection shall be full size of switch connection, but not less than NPS 1/2. Install stainless-steel bushing if required to mate switch to system connection.
5. Connect process tubing from point of system connection and extend to transmitter.
6. Install isolation valves in process tubing as close to system connection as practical.
7. Install dirt leg and drain valve at each transmitter connection.
8. Do not mount transmitters on equipment.
9. Install in a location free from vibration, heat, moisture, or adverse effects, which could damage and hinder accurate operation.

3.5 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Each piece of wire, cable, and tubing shall have the same designation at each end for operators to determine continuity at points of connection. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Install engraved phenolic nameplate with instrument identification.

3.6 CHECKOUT PROCEDURES

A. Check out installed products before continuity tests, leak tests, and calibration.

B. Check instruments for proper location and accessibility.

C. Check instruments for proper installation with respect to direction of flow, elevation, orientation, insertion depth, or other applicable considerations that impact performance.

3.7 ADJUSTMENT, CALIBRATION, AND TESTING

A. Description:

1. Calibrate each instrument installed that is not factory calibrated and provided with calibration documentation.
2. Provide a written description of proposed field procedures and equipment for calibrating each type of instrument. Submit procedures before calibration and adjustment.
3. For each analog instrument, perform a three-point calibration test for both linearity and accuracy.
4. Equipment and procedures used for calibration shall comply with instrument manufacturer's recommendations.
5. Provide diagnostic and test equipment for calibration and adjustment.
6. Field instruments and equipment used to test and calibrate installed instruments shall have accuracy at least twice the instrument accuracy being calibrated. For example, an installed instrument with an accuracy of 1 percent shall be checked by an instrument with an accuracy of 0.5 percent.
7. Calibrate each instrument according to instrument instruction manual supplied by manufacturer.
8. If, after calibration, indicated performance cannot be achieved, replace out-of-tolerance instruments.
9. Comply with field-testing requirements and procedures indicated by ASHRAE Guideline 11, "Field Testing of HVAC Control Components," in the absence of specific requirements, and to supplement requirements indicated.

B. Analog Signals:

1. Check analog voltage signals using a precision voltage meter at zero, 50, and 100 percent.
2. Check analog current signals using a precision current meter at zero, 50, and 100 percent.

C. Digital Signals:

1. Check digital signals using a jumper wire.
2. Check digital signals using an ohmmeter to test for contact.

D. Sensors: Check sensors at zero, 50, and 100 percent of project design values.

E. Switches: Calibrate switches to make or break contact at set points indicated.

F. Transmitters:

1. Check and calibrate transmitters at zero, 50, and 100 percent of project design values.

3.8 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

© 2026 CDM Smith
All Rights Reserved

3.9 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain instrumentation and control devices.

B. Coordinate pressure instrument demonstration video with operation and maintenance manuals and classroom instruction for use by Owner in operating, maintaining, and troubleshooting.

C. Record videos on DVD disks.

D. Owner shall have right to make additional copies of video for internal use without paying royalties.

SECTION 230923.27 - TEMPERATURE INSTRUMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Air temperature sensors.
2. Air temperature switches.
3. Liquid and steam temperature sensors.
4. High-end, commercial-grade, liquid and steam temperature transmitters.

B. Related Requirements:

1. Section 230923 "Direct-Digital Control System for HVAC" for control equipment and software, relays, electrical power devices, uninterruptible power supply units, wire, and cable.

1.3 DEFINITIONS

A. RTD: Resistance temperature detector.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product, including the following:

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Operating characteristics, electrical characteristics, and furnished accessories indicating process operating range, accuracy over range, control signal over range, default control signal with loss of power, calibration data specific to each unique application, electrical power requirements, and limitations of ambient operating environment, including temperature and humidity.
3. Product description with complete technical data, performance curves, and product specification sheets.
4. Installation, operation, and maintenance instructions, including factors affecting performance.

B. Shop Drawings:

1. Include plans, elevations, sections, and details.
2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.
4. Include number-coded identification system for unique identification of wiring, cable, and tubing ends.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plan drawings and corresponding product installation details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Product installation location shown in relationship to room, duct, pipe, and equipment.
2. Wall-mounted instruments located in finished space showing relationship to light switches, fire-alarm devices, and other installed devices.
3. Sizes and locations of wall access panels for instruments installed behind walls.
4. Sizes and locations of ceiling access panels for instruments installed in inaccessible ceilings.

B. Product Certificates: For each product requiring a certificate.

C. Product Test Reports: For each product, for tests performed by a qualified testing agency.

D. Field quality-control reports.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Environmental Conditions:

1. Instruments shall operate without performance degradation under the ambient environmental temperature, pressure, humidity, and vibration conditions specified and encountered for installed location.

    a. If instrument alone cannot meet requirement, install instrument in a protective enclosure that is isolated and protected from conditions impacting performance. Enclosure shall be internally insulated, electrically heated, filtered, and ventilated as required by instrument and application.

2. Instruments and accessories shall be protected with enclosures satisfying the following minimum requirements unless more stringent requirements are indicated. Instruments not available with integral enclosures complying with requirements indicated shall be housed in protective secondary enclosures. Instrument's installed location shall dictate following NEMA 250 enclosure requirements:

    a. Outdoors: Type 4X.

b. Indoors, Mezzanine Level: Type 1.
c. Indoors, Ground Floor: Type 1.
d. Indoors below Ground Floor: Type 4X.

2.2 AIR TEMPERATURE SENSORS

A. Platinum RTDs: Common Requirements:

1. 100 or 1000 ohms at zero deg C and a temperature coefficient of 0.00385 ohm/ohm/deg C.
2. Two-wire, PTFE-insulated, 22-gage stranded copper leads.
3. Performance Characteristics:

   a. Range: Minus 50 to 275 deg F.
   b. Interchangeable Accuracy: At 32 deg F within 0.5 deg F.
   c. Repeatability: Within 0.5 deg F.
   d. Self-Heating: Negligible.

4. Transmitter Requirements:

   a. Transmitter required for each 100-ohm RTD.
   b. Transmitter optional for 1000-ohm RTD, contingent on compliance with end-to-end control accuracy.

B. Thermal Resistors (Thermistors): Common Requirements:

1. 10,000 ohms at 25 deg C and a temperature coefficient of 23.5 ohms/ohm/deg C.
2. Two-wire, PTFE-insulated, 22-gage stranded copper leads.
3. Performance Characteristics:

   a. Range: Minus 50 to 275 deg F.
   b. Interchangeable Accuracy: At 77 deg F within 0.5 deg F.
   c. Repeatability: Within 0.5 deg F.
   d. Drift: Within 0.5 deg F over 10 years.
   e. Self-Heating: Negligible.

4. Transmitter optional, contingent on compliance with end-to-end control accuracy.

C. Thermistor, Single-Point Duct Air Temperature Sensors:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

   a. Dwyer Instruments, Inc.
   b. Honeywell International Inc.
   c. Johnson Controls Inc.
   d. Or equal.

2. Temperature Range: Minus 50 to 275 deg F

3. Probe: Single-point sensor with a stainless-steel sheath.
4. Length: As required by application to achieve tip at midpoint of air tunnel, up to 18 inches.
5. Enclosure: Junction box with removable cover; NEMA 250, Type 1 for indoor applications and Type 4 for outdoor applications.
6. Gasket for attachment to duct or equipment to seal penetration airtight.
7. Conduit Connection: 1/2- inch trade size

D. Thermistor Outdoor Air Temperature Sensors:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Dwyer Instruments, Inc.
    b. Honeywell International Inc.
    c. Johnson Controls Inc.
    d. Or equal.

2. Temperature Range: Minus 50 to 275 deg F
3. Probe: Single-point sensor with a stainless-steel sheath.
4. Solar Shield: Stainless steel.
5. Enclosure: NEMA 250, Type 4 or 4X junction box or combination conduit and outlet box with removable cover and gasket.
6. Conduit Connection: 1/2-inch trade size.

E. Space Air Temperature Sensors for Use with DDC Controllers Controlling Terminal Units:

1. 100-ohm platinum RTD or thermistor.
2. Thermistor:

    a. Pre-aged, burned in, and coated with glass; inserted in a metal sleeve; and entire unit encased in epoxy.
    b. Thermistor drift shall be less than plus or minus 0.5 deg F over 10 years.

3. Temperature Transmitter Requirements:

    a. Mating transmitter required with each 100-ohm RTD.
    b. Mating transmitters optional for 1000-ohm RTD and thermistor, contingent on compliance with end-to-end control accuracy.

4. Provide digital display of sensed temperature.

2.3 AIR TEMPERATURE SWITCHES

A. Thermostat and Switch for Low Temperature Control in Duct Applications:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Dwyer Instruments, Inc.
b. Honeywell International Inc.
c. Johnson Controls Inc.
d. Or equal.

2. Description:

a. Two-position control.
b. Field-adjustable set point.
c. Manual reset.
d. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

3. Performance:

a. Operating Temperature Range: 15 to 55 deg F.
b. Temperature Differential: 5 deg F, non-adjustable and additive.
c. Enclosure Ambient Temperature: Minus 20 to 140 deg F.
d. Sensing Element Maximum Temperature: 250 deg F.
e. Voltage: 120-V ac.
f. Current: 16 FLA.
g. Switch Type: Two SPDT snap switches operate on coldest 12-inchsection along element length.

4. Construction:

a. Vapor-Filled Sensing Element: Nominal 20 feetlong.
b. Dual Temperature Scale: Fahrenheit and Celsius visible on face.
c. Set-Point Adjustment: Screw.
d. Enclosure: Painted metal, NEMA 250, Type 1.
e. Electrical Connections: Screw terminals.
f. Conduit Connection: 1/2-inch trade size.

2.4 AIR TEMPERATURE RTD TRANSMITTERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Dwyer Instruments, Inc.
2. Honeywell International Inc.
3. Johnson Controls Inc.
4. Or equal.

B. Source Limitations: Obtain temperature-measuring sensors and transmitters and airflow from single manufacturer.

C. House electronics in NEMA 250 enclosure.

1. Duct: Type 4.
2. Outdoor: Type 4X.

3. Space: Type 4.

D. Conduit Connection: 1/2-inch

E. Functional Characteristics:

1. Input:

a. 100-ohm platinum RTD temperature coefficient of 0.00385 ohm/ohm/deg C, two-wire sensors.
b. 1000-ohm platinum RTD temperature coefficient of 0.00385 ohm/ohm/deg C, two-wire sensors.

2. Span (Adjustable):

a. Space: 40 to 90 deg F.
b. Supply Air Cooling and Heating: 40 to 120 deg F.
c. Supply Air Cooling Only: 40 to 90 deg F.
d. Supply Air Heating Only: 40 to 120 deg F.
e. Exhaust Air: 50 to 100 deg F.
f. Return Air: 50 to 100 deg F.
g. Mixed Air: Minus 40 to 140 deg F.
h. Outdoor: Minus 40 to 140 deg F.

3. Output: 4- to 20-mA dc, linear with temperature; RFI insensitive; minimum drive load of 600 ohms at 24-V dc .
4. Zero and span field adjustments, plus or minus 5 percent of span. Minimum span of 50 deg F.
5. Match sensor with temperature transmitter and factory calibrate together.

F. Performance Characteristics:

1. Calibration Accuracy: Within 0.1 percent of the span.
2. Stability: Within 0.2 percent of the span for at least 6 months.
3. Combined Accuracy: Within 0.5 percent.

2.5 LIQUID AND STEAM TEMPERATURE SENSORS, COMMERCIAL GRADE

A. RTD:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Dwyer Instruments, Inc.
b. Honeywell International Inc.
c. Johnson Controls Inc.
d. Or equal.

2. Description:

a. Platinum with a value of 100 or 1000ohms at zero deg C and a temperature coefficient of 0.00385 ohm/ohm/deg C.
b. Encase RTD in a stainless-steel sheath with a 0.25-inch OD.
c. Sensor Length: 4, 6, or 8 inchesas required by application.
d. Process Connection: Threaded, NPS 1/2
e. Two-stranded copper lead wires.
f. Powder-coated steel enclosure, NEMA 250, Type 4.
g. Conduit Connection: 1/2-inch
h. Performance Characteristics:

1) Range: Minus 40 to 210 deg F.
2) Interchangeable Accuracy: Within 0.54 deg F at 32 deg F.

B. Thermowells:

1. Stem: Straight or stepped shank formed from solid bar stock.
2. Material: stainless steel.
3. Process Connection: Threaded, NPS 3/4.
4. Sensor Connection: Threaded, NPS 1/2.
5. Bore: Sized to accommodate sensor with tight tolerance between sensor and well.
6. Furnish thermowells installed in insulated pipes and equipment with an extended neck.
7. Length: 4, 6, or 8 inchesas required by application.
8. Thermowells furnished with heat-transfer compound to eliminate air gap between wall of sensor and thermowell and to reduce time constant.

2.6 LIQUID AND STEAM TEMPERATURE TRANSMITTERS, COMMERCIAL GRADE

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Dwyer Instruments, Inc.
2. Honeywell International Inc.
3. Johnson Controls Inc.
4. Or equal.

B. House electronics in NEMA 250, Type 4X enclosure.

C. Enclosure Connection: 1/2-inch trade size.

D. Functional Characteristics:

1. Input: 100-ohm platinum RTD temperature coefficient of 0.00385 ohm/ohm/deg C, two- or three-wire sensors.
2. Default Span (Adjustable):

a. Chilled Water: Zero to 100 deg F.
b. Heating Hot Water: 32 to 212 deg F.

3. Output: 4- to 20-mA dc, linear with temperature; RFI insensitive; minimum drive load of 600 ohms at 24-V dc.

4. Zero and span field adjustments, plus or minus 5 percent of span. Minimum span of 50 deg F.
5. Match sensor with temperature transmitter and factory calibrate together. Each matched sensor and transmitter set shall include factory calibration data traceable to NIST.

E. Performance Characteristics:

1. Calibration Accuracy: Within 0.1 percent of the span.
2. Stability: Within 0.2 percent of the span for at least 6 months.
3. Combined Accuracy: Within 0.5 percent.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for instruments installed in piping to verify actual locations of connections before installation.

C. Examine roughing-in for instruments installed in duct systems to verify actual locations of connections before installation.

D. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Install products level, plumb, parallel, and perpendicular with building construction.

B. Properly support instruments, tubing, piping, wiring, and conduit to comply with requirements indicated. Brace all products to prevent lateral movement and sway or a break in attachment when subjected to a 5 pound force.

C. Fastening Hardware:

1. Stillson wrenches, pliers, and other tools that cause injury to or mar surfaces of rods, nuts, and other parts are prohibited for work of assembling and tightening nuts.
2. Tighten bolts and nuts firmly and uniformly. Do not overstress threads by excessive force or by oversized wrenches.
3. Lubricate threads of bolts, nuts, and screws with graphite and oil before assembly.

D. Install products in locations that are accessible and that permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.

E. Corrosive Environments:

1. Use products that are suitable for environment to which they are subjected.
2. If possible, avoid or limit use of materials in corrosive environments.
3. When conduit is in contact with a corrosive environment, use Type 316 stainless-steel conduit and fittings or conduit and fittings that are coated with a corrosive-resistant coating that is suitable for environment.
4. Where instruments are located in a corrosive environment and are not corrosive resistant from manufacturer, field install products in a NEMA 250, Type 4X enclosure constructed of Type 316L stainless steel.

3.3 ELECTRIC POWER

A. Furnish and install electrical power to products requiring electrical connections.

B. Furnish and install circuit breakers. Comply with requirements in Section 262816 "Enclosed Switches and Circuit Breakers."

C. Furnish and install power wiring. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

D. Furnish and install raceways. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems."

3.4 TEMPERATURE INSTRUMENT INSTALLATIONS

A. Mounting Location:

1. Roughing In:

   a. Outline instrument mounting locations before setting instruments and routing cable, wiring, tubing, and conduit to final location.
   b. Provide independent inspection to confirm that proposed mounting locations comply with requirements indicated and approved submittals.

      1) Indicate dimensioned locations with mounting height for all surface-mounted products on Shop Drawings.
      2) Do not begin installation without submittal approval of mounting location.

   c. Complete installation rough-in only after confirmation by independent inspection is complete and approval of location is documented for review by Owner and Engineer on request.

2. Install switches and transmitters for air and liquid temperature associated with individual air-handling units and associated connected ductwork and piping near air-handling units co-located in air-handling unit system control panel to provide service personnel a single and convenient location for inspection and service.
3. Install liquid and steam temperature switches and transmitters for indoor applications in mechanical equipment rooms. Do not locate in user-occupied space unless indicated specifically on Drawings.

4. Install air temperature switches and transmitters for indoor applications in mechanical equipment rooms. Do not locate in user-occupied space unless indicated specifically on Drawings.
5. Mount switches and transmitters on walls, floor-supported freestanding pipe stands, or floor-supported structural support frames. Use manufacturer's mounting brackets to accommodate field mounting. Securely support and brace products to prevent vibration and movement.

B. Special Mounting Requirements:

1. Protect products installed outdoors from solar radiation, building and wind effect with stand-offs and shields constructed of Type 316 stainless.
2. Temperature instruments having performance impacted by temperature of mounting substrate shall be isolated with an insulating barrier located between instrument and substrate to eliminate effect. Where instruments requiring insulation are located in finished space, conceal insulating barrier in a cover matching the instrument cover.

C. Mounting Height:

1. Mount temperature instruments in user-occupied space to match mounting height of light switches unless otherwise indicated on Drawings. Mounting height shall comply with codes and accessibility requirements.
2. Mount switches and transmitters located in mechanical equipment rooms and other similar space not subject to code or state and Federal accessibility requirements within a range of 42 to 72 inchesabove the adjacent floor, grade, or service catwalk or platform.

    a. Make every effort to mount at 60 inches.

D. Seal penetrations to ductwork, plenums, and air-moving equipment to comply with duct static-pressure class and leakage and seal classes indicated using neoprene gaskets or grommets.

E. Space Temperature Sensor Installation:

1. Conceal assembly in an electrical box of sufficient size to house sensor and transmitter, if provided.
2. Install electrical box with a faceplate to match sensor cover if sensor cover does not completely cover electrical box.
3. In finished areas, recess electrical box within wall.
4. In unfinished areas, electrical box may be surface mounted if electrical light switches are surface mounted. Use a cast-aluminum electric box for surface-mounted installations.
5. Align electrical box with other electrical devices such as visual alarms and light switches located in the vicinity to provide a neat and well-thought-out arrangement. Where possible, align in both horizontal and vertical axis.

F. Outdoor Air Temperature Sensor Installation:

1. Mount sensor in a discrete location facing north.
2. Protect installed sensor from solar radiation and other influences that could impact performance.
3. If required to have a transmitter, mount transmitter remote from sensor in an accessible and serviceable location indoors.

G. Single-Point Duct Temperature Sensor Installation:

1. Install single-point-type, duct-mounted, supply- and return-air temperature sensors. Install sensors in ducts with sensitive portion of the element installed in center of duct cross section and located to sense near average temperature. Do not exceed 24 inches in sensor length.
2. Install return-air sensor in location that senses return-air temperature without influence from outdoor or mixed air.
3. Rigidly support sensor to duct and seal penetration airtight.
4. If required to have transmitter, mount transmitter remote from sensor at accessible and serviceable location.

H. Averaging Duct Temperature Sensor Installation:

1. Install averaging-type air temperature sensor for temperature sensors located within air-handling units, similar equipment, and large ducts with air tunnel cross-sectional area of 20 sq. ft. and larger.
2. Install sensor length to maintain coverage over entire cross-sectional area. Install multiple sensors where required to maintain the minimum coverage.
3. Fasten and support sensor with manufacturer-furnished clips to keep sensor taut throughout entire length.
4. If required to have transmitter, mount transmitter in an accessible and serviceable location.

I. Low-Limit Air Temperature Switch Installation:

1. Install multiple low-limit switches to maintain coverage over entire cross-sectional area of air tunnel.
2. Fasten and support sensing element with manufacturer-furnished clips to keep element taut throughout entire length.
3. Mount switches outside of airstream at a location and mounting height to provide easy access for switch set-point adjustment and manual reset.
4. Install on entering side of cooling coil unless otherwise indicated on Drawings.

J. Liquid Temperature Sensor Installation:

1. Assembly shall include sensor, thermowell and connection head.
2. For pipe NPS 4 and larger, install sensor and thermowell length to extend into pipe between 50 to 75 percent of pipe cross section.
3. For pipe smaller than NPS 4:

    a. Install reducers to increase pipe size to NPS 4at point of thermowell installation.
    b. For pipe sizes NPS 2-1/2 and NPS 3, thermowell and sensor may be installed at pipe elbow or tee to achieve manufacturer-recommended immersion depth in lieu of increasing pipe size.
    c. Minimum insertion depth shall be 2-1/2 inches.

4. Install matching thermowell.
5. Fill thermowell with heat-transfer fluid before inserting sensor.
6. Tip of spring-loaded sensors shall contact inside of thermowell.

7. For insulated piping, install thermowells with extension neck to extend beyond face of insulation.
8. Install thermowell in top dead center of horizontal pipe positioned in an accessible location to allow for inspection and replacement. If top dead center location is not possible due to field constraints, install thermowell at location along top half of pipe.
9. For applications with transmitters, mount transmitter remote from sensor in an accessible and serviceable location from floor.

3.5 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Each piece of wire, cable, and tubing shall have the same designation at each end for operators to determine continuity at points of connection. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Install engraved phenolic nameplate with instrument identification.

3.6 CLEANING

A. Remove grease, mastic, adhesives, dust, dirt, stains, fingerprints, labels, and other foreign materials from exposed interior and exterior surfaces.

B. Wash and shine glazing.

C. Polish glossy surfaces to a clean shine.

3.7 CHECK-OUT PROCEDURES

A. Check installed products before continuity tests, leak tests, and calibration.

B. Check temperature instruments for proper location and accessibility.

C. Verify sensing element type and proper material.

D. Verify location and length.

E. Verify that wiring is correct and secure.

3.8 ADJUSTMENT, CALIBRATION, AND TESTING

A. Description:

1. Calibrate each instrument installed that is not factory calibrated and provided with calibration documentation.
2. Provide a written description of proposed field procedures and equipment for calibrating each type of instrument. Submit procedures before calibration and adjustment.
3. For each analog instrument, make a three-point test of calibration for both linearity and accuracy.

4. Equipment and procedures used for calibration shall meet instrument manufacturer's written instructions.
5. Provide diagnostic and test equipment for calibration and adjustment.
6. Field instruments and equipment used to test and calibrate installed instruments shall have accuracy at least twice the instrument accuracy being calibrated. For example, an installed instrument with an accuracy of 1 percent shall be checked by an instrument with an accuracy of 0.5 percent.
7. Calibrate each instrument according to instrument instruction manual supplied by manufacturer.
8. If after calibration indicated performance cannot be achieved, replace out-of-tolerance instruments.
9. Comply with field-testing requirements and procedures indicated by ASHRAE Guideline 11, "Field Testing of HVAC Control Components," in the absence of specific requirements and to supplement requirements indicated.

B. Analog Signals:

1. Check analog voltage signals using a precision voltage meter at zero, 50, and 100 percent.
2. Check analog current signals using a precision current meter at zero, 50, and 100 percent.
3. Check resistance signals for temperature sensors at zero, 50, and 100 percent of operating span using a precision-resistance source.

C. Digital Signals:

1. Check digital signals using a jumper wire.
2. Check digital signals using an ohmmeter to test for contact.

D. Sensors: Check sensors at zero, 50, and 100 percent of Project design values.

E. Switches: Calibrate switches to make or break contact at set points indicated.

F. Transmitters:

1. Check and calibrate transmitters at zero, 50, and 100 percent of Project design values.
2. Calibrate resistance temperature transmitters at zero, 50, and 100 percent of span using a precision-resistance source.

3.9 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Perform according to manufacturer's written instruction.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Prepare test and inspection reports.

© 2026 CDM Smith
All Rights Reserved

3.10 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.11 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain temperature instruments.

B. Provide a complete set of instructional videos covering each product specified and installed and showing the following:

1. Software programming.
2. Calibration and test procedures.
3. Operation and maintenance requirements and procedures.
4. Troubleshooting procedures.

C. Coordinate video with operation and maintenance manuals and classroom instruction for use by Owner in operating, maintaining, and troubleshooting.

D. Record videos on DVD disks.

E. Owner shall have right to make additional copies of video for internal use without paying royalties.

SECTION 232113 - HYDRONIC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes pipe and fitting materials and joining methods for the following:

1. Copper tube and fittings.
2. Steel pipe and fittings.
3. Joining materials.
4. Transition fittings.
5. Dielectric fittings.
6. Bypass chemical feeder.
7. Automatic Glycol Feed System

B. Related Requirements:

1. Steam and condensate heating piping is included in Section 232213.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of the following:

1. Pipe.
2. Fittings.
3. Joining materials.

B. Delegated-Design Submittal:

1. Design calculations and detailed fabrication and assembly of pipe anchors and alignment guides, hangers and supports for multiple pipes, expansion joints and loops, and attachments of the same to the building structure.
2. Locations of pipe anchors and alignment guides and expansion joints and loops.
3. Locations of and details for penetrations, including sleeves and sleeve seals for exterior walls, floors, basement, and foundation walls.
4. Locations of and details for penetration and firestopping for fire- and smoke-rated wall and floor and ceiling assemblies.
5. Seismic and thermal analysis for pipe supports, anchors and guides.

© 2026 CDM Smith
All Rights Reserved

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Piping layout, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Suspended ceiling components.
2. Other building services, including light fixture and sprinkler layouts.
3. Structural members.
4. Architectural layout showing smoke and firewalls, floors and full height walls/partitions.

B. Qualification Data: For Installer.

C. Welding certificates.

D. Field quality-control reports.

E. Welding inspection certificates

F. Preconstruction Test Reports:

1. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.

1.5 QUALITY ASSURANCE

A. Installer Qualifications:

1. Installers of Pressure-Sealed Joints: Installers shall be certified by pressure-seal joint manufacturer as having been trained and qualified to join piping with pressure-seal pipe couplings and fittings.
2. Fiberglass Pipe and Fitting Installers: Installers of RTRF and RTRP shall be certified by manufacturer of pipes and fittings as having been trained and qualified to join fiberglass piping with manufacturer-recommended adhesive.

B. Steel Support Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

C. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code: Section IX.

1. Comply with ASME B31.9, "Building Services Piping," ASME B31.3 "Process Piping" or ASME B31.1 "Power Piping" for materials, products, and installation.
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

1.6 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Engage a qualified testing agency to perform preconstruction testing on water quality.

B. Preconstruction Testing for Existing Hydronic Systems: Contractor shall engage a Testing and Balancing agent/organization. Agency shall test and document water flows of existing pumps, mains and specified branches. Agency shall comply with requirements of Section 230593 "Testing, Adjusting, and Balancing for HVAC."

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Hydronic piping, gaskets, and covering shall comply with ASTM 25/50, Flame Spread/Smoke Developed testing.

B. Hydronic piping components and installation shall be capable of withstanding the following minimum working pressure and temperature unless otherwise indicated:

1. Hot-Water Heating Piping: 150 psig at 250 deg F.
2. Chilled-Water Piping: 150 psig at 100 deg F.
3. Safety-Valve-Inlet and -Outlet Piping: Equal to the pressure of the piping system to which it is attached.

2.2 COPPER TUBE AND FITTINGS

A. Hard-Drawn-Temper Copper Tubing: ASTM B88, Type L.

B. Annealed-Temper Copper Tubing: ASTM B88, Type K.

C. DWV Copper Tubing: ASTM B306, Type DWV.

D. Copper or Bronze Pressure-Seal Fittings:

1. Housing: Copper.
2. O-Rings and Pipe Stops: EPDM.
3. Tools: Manufacturer's special tools.
4. Minimum 200-psig working-pressure rating at 250 deg F.

E. Wrought-Copper Unions: ASME B16.22.

2.3 STEEL PIPE AND FITTINGS

A. Steel Pipe: ASTM A53, black steel with plain ends; welded and seamless, Grade B, and wall thickness as indicated in "Piping Applications" Article.

B. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125 and 250 as indicated in "Piping Applications" Article.

C. Malleable-Iron Threaded Fittings: ASME B16.3, Classes 150 and 300 as indicated in "Piping Applications" Article.

D. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in "Piping Applications" Article.

E. Cast-Iron Pipe Flanges and Flanged Fittings: ASME B16.1, Classes 25, 125, and 250; raised ground face, and bolt holes spot faced as indicated in "Piping Applications" Article.

F. Wrought-Steel Fittings: ASTM A234/A234M, wall thickness to match adjoining pipe.

G. Wrought Cast- and Forged-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:

1. Material Group: 1.1.
2. End Connections: Butt welding.
3. Facings: Raised face.

H. Grooved Mechanical-Joint Fittings and Couplings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

   a. Anvil International.
   b. Grinnell G-Fire by Johnson Controls Company.
   c. Victaulic Company.
   d. Or equal.

2. Joint Fittings: ASTM A536, Grade 65-45-12 ductile iron; ASTM A47/A47M, Grade 32510 malleable iron; ASTM A53/A53M, Type F, E, or S, Grade B fabricated steel; or ASTM A106/A106M, Grade B steel fittings with grooves or shoulders constructed to accept grooved-end couplings; with nuts, bolts, locking pin, locking toggle, or lugs to secure grooved pipe and fittings.
3. Couplings: Ductile- or malleable-iron housing and EPDM gasket of central cavity pressure-responsive design; with nuts, bolts, locking pin, locking toggle, or lugs to secure grooved pipe and fittings.

I. Steel Pressure-Seal Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

   a. Victaulic Company.
   b. Viega LLC.
   c. Or equal.

2. Housing: Steel.
3. O-Rings and Pipe Stop: EPDM.
4. Tools: Manufacturer's special tool.
5. Minimum 300-psig working-pressure rating at 230 deg F.

J. Steel Pipe Nipples: ASTM A733, made of same materials and wall thicknesses as pipe in which they are installed.

2.4 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless otherwise indicated.

a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.

D. Solder Filler Metals: ASTM B32, lead-free alloys. Include water-flushable flux according to ASTM B813.

E. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.

F. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.5 DIELECTRIC FITTINGS

A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.

B. Dielectric Unions:

1. Description:

a. Standard: ASSE 1079.
b. Pressure Rating: 125 psig minimum at 180 deg F or 150 psig.
c. End Connections: Solder-joint copper alloy and threaded ferrous.

C. Dielectric Flanges:

1. Description:

a. Standard: ASSE 1079.
b. Factory-fabricated, bolted, companion-flange assembly.
c. Pressure Rating: 125 psig minimum at 180 deg F.
d. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

D. Dielectric-Flange Insulating Kits:

1. Description:

a. Nonconducting materials for field assembly of companion flanges.
b. Pressure Rating: 150 psig.
c. Gasket: Neoprene or phenolic.
d. Bolt Sleeves: Phenolic or polyethylene.
e. Washers: Phenolic with steel backing washers.

E. Dielectric Nipples:

1. Description:

a. Standard: IAPMO PS 66.
b. Electroplated steel nipple, complying with ASTM F1545.
c. Pressure Rating: 300 psig at 225 deg F.
d. End Connections: Male threaded or grooved.
e. Lining: Inert and noncorrosive, propylene.

2.6 BYPASS CHEMICAL "SHOT" FEEDER

A. Description: Welded steel construction; 125-psig working pressure; 5-gal. capacity; with fill funnel and inlet, outlet, and drain valves.

1. Chemicals: Specially formulated, based on analysis of makeup water, to prevent accumulation of scale and corrosion in piping and connected equipment.

2.7 AUTOMATIC GLYCOL FEED SYSTEM

A. Basis-of-Design Product: Subject to compliance with requirements, provide Neptune Chemical Pump Co. Inc., model G-50-1-RC or comparable product by one of the following:

1. Bell and Gossett.
2. A&F Machine Products Company.

B. Description: The system automatically maintains pressure in the piping system by adding premixed glycol solution to make-up losses in the system.

C. Pump: 1.5 gpm bronze gear pump

D. Tank: 50-gallon polyethylene mounted in a steel frame with float switch for low level pump shutoff and alarm.

E. Control is by an adjustable pressure control switch. The pressure range shall be selected based on the pressures expected in the system.

F. Control Components:

1. NEMA 4X Control Panel

2. Hand-off auto-selector switch for pump motor
3. Pump "on" indicator light
4. "Low" tank level indicator light
5. Dry contact for remote low level indication
6. Hand-Off-Auto selector switch
7. Float switch for pump shutoff and activate light and audible alarm
8. Dry contact for remote alarm

G. Power: 115 volt, single phase.

H. Discharge piping accessories:

1. Shutoff ball valve
2. Check valve
3. Relief valve
4. Pressure valve
5. Pressure switch

I. Suction piping accessories:

1. Shutoff ball valve
2. Strainer

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS

A. Hot-water heating piping, aboveground, NPS 2 and smaller, shall be any of the following:

1. Type L, hard-drawn-temper copper tubing, wrought-copper fittings, and soldered, brazed, or pressure-seal joints.
2. Schedule 40 steel pipe; Class 125, cast-iron fittings; cast-iron flanges and flange fittings; and threaded joints.

B. Hot-water heating piping, aboveground, NPS 2-1/2 and larger, shall be any of the following:

1. Schedule 40 steel pipe, wrought-steel fittings and wrought-cast or forged-steel flanges and flange fittings, and welded and flanged joints.
2. Schedule 40 steel pipe; grooved, mechanical joint coupling and fittings; and grooved, mechanical joints.

C. Chilled-water piping, aboveground, NPS 2 and smaller, shall be any of the following:

1. Type L, hard-drawn-temper copper tubing, wrought-copper fittings, and soldered, brazed, or pressure-seal joints.
2. Schedule 40 steel pipe; Class 125, cast-iron fittings; cast-iron flanges and flange fittings; and threaded joints.

D. Chilled-water piping, aboveground, NPS 2-1/2 and larger, shall be any of the following:

1. Schedule 40 steel pipe, wrought-steel fittings and wrought-cast or forged-steel flanges and flange fittings, and welded and flanged joints.
2. Schedule 40 steel pipe; grooved, mechanical joint coupling and fittings; and grooved, mechanical joints.

E. Safety-Valve-Inlet and -Outlet Piping for Hot-Water Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed with metal-to-plastic transition fittings for plastic piping systems according to piping manufacturer's written instructions.

3.2 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Install piping to allow application of insulation.

J. Select system components with pressure rating equal to or greater than system operating pressure.

K. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

L. Install drains, consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

M. Install air vents, consisting of a tee, 3/4-inch ball valve, short threaded nipple with cap or an automatic vent at all system high points.

N. Install piping at a uniform grade of 0.2 percent upward in direction of flow.

O. Reduce pipe sizes using eccentric reducer fitting installed with level side up.

P. Install branch connections to mains using tee fittings in main pipe, with the branch connected to the bottom of the main pipe. For up-feed risers, connect the branch to the top of the main pipe.

Q. Install valves according to the following:

1. Section 230523.12 "Ball Valves for HVAC Piping."
2. Section 230523.13 "Butterfly Valves for HVAC Piping."

R. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated. Route piping and install unions and shutoff valves to allow equipment removal without disturbing piping.

S. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

T. Install shutoff valve immediately upstream of each dielectric fitting.

U. Comply with requirements in Section 230553 "Identification for HVAC Piping and Equipment" for identifying piping.

V. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 230517 "Sleeves and Sleeve Seals for HVAC Piping."

W. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 230517 "Sleeves and Sleeve Seals for HVAC Piping."

3.3 DIELECTRIC FITTING INSTALLATION

A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

B. Dielectric Fittings for NPS 2 and Smaller: Use dielectric nipples or unions.

C. Dielectric Fittings for NPS 2-1/2 to NPS 4: Use dielectric flanges and flange kits.

D. Dielectric Fittings for NPS 5 and Larger: Use dielectric flange kits.

3.4 INSTALLATION OF HANGERS AND SUPPORTS

A. Comply with requirements in Section 230529 "Hangers and Supports for HVAC Piping and Equipment" for hangers, supports, and anchor devices.

B. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
4. Spring hangers to support vertical runs.

5. Provide copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.
6. On plastic pipe, install pads or cushions on bearing surfaces to prevent hanger from scratching pipe.

C. Install hangers for copper tubing and steel piping, with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

D. Install hangers for plastic piping, with maximum horizontal spacing and minimum rod diameters, to comply with manufacturer's written instructions, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

E. Install hangers for fiberglass piping, with maximum horizontal spacing and minimum rod diameters, to comply with manufacturer's written instructions, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

F. Support horizontal piping within 12 inches of each fitting and coupling.

G. Support vertical runs of copper tubing and steel piping to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

H. Support vertical runs of fiberglass piping to comply with manufacturer's written instructions, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

3.5 PIPE JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Soldered Joints: Apply flux to tube end. Construct joints according to ASTM B828 or CDA's "Copper Tube Handbook," using solder alloy.

D. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8/A5.8M.

E. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

F. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.

G. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

H. Grooved Joints: Assemble joints with coupling and gasket, lubricant, and bolts. Cut or roll grooves in ends of pipe based on pipe and coupling manufacturer's written instructions for pipe wall thickness. Use grooved-end fittings and rigid, grooved-end-pipe couplings.

I. Pressure-Sealed Joints: Use manufacturer-recommended tool and procedure. Leave insertion marks on pipe after assembly.

3.6 TERMINAL EQUIPMENT CONNECTIONS

A. Sizes for supply and return piping connections shall be the same as or larger than equipment connections.

B. Install control valves in accessible locations close to connected equipment.

C. Install ports for pressure gages and thermometers at coil inlet and outlet connections. Comply with requirements in Section 230519 "Meters and Gages for HVAC Piping."

3.7 CHEMICAL TREATMENT

A. Perform an analysis of makeup water to determine type and quantities of chemical treatment needed to keep system free of scale, corrosion, and fouling, and to sustain the following water characteristics:

1. pH: 9.0 to 10.5.
2. "P" Alkalinity: 100 to 500 ppm.
3. Boron: 100 to 200 ppm.
4. Chemical Oxygen Demand: Maximum of 100 ppm. Revise this value if closed system contains glycol.
5. Corrosion Inhibitor:

    a. Sodium Nitrate: 1000 to 1500 ppm.
    b. Molybdate: 200 to 300 ppm.
    c. Chromate: 200 to 300 ppm.
    d. Sodium Nitrate Plus Molybdate: 100 to 200 ppm each.
    e. Chromate Plus Molybdate: 50 to 100 ppm each.

6. Soluble Copper: Maximum of 0.20 ppm.
7. Tolyiriazole Copper and Yellow Metal Corrosion Inhibitor: Minimum of 10 ppm.
8. Total Suspended Solids: Maximum of 10 ppm.
9. Ammonia: Maximum of 20 ppm.
10. Free Caustic Alkalinity: Maximum of 20 ppm.
11. Microbiological Limits:

    a. Total Aerobic Plate Count: Maximum of 1000 organisms/mL.
    b. Total Anaerobic Plate Count: Maximum of 100 organisms/mL.
    c. Nitrate Reducers: 100 organisms/mL.

d. Sulfate Reducers: Maximum of zero organisms/mL.
e. Iron Bacteria: Maximum of zero organisms/mL.

B. Install bypass chemical feeders in each hydronic system where indicated.

1. Install in upright position with top of funnel not more than 48 inches above the floor.
2. Install feeder in minimum NPS 3/4 bypass line, from main with full-size, full-port, ball valve in the main between bypass connections.
3. Install NPS 3/4 pipe from chemical feeder drain to nearest equipment drain and include a full-size, full-port, ball valve.

C. Fill system with fresh water and add liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products from piping. Circulate solution for a minimum of 24 hours, drain, clean strainer screens, and refill with fresh water.

D. Add initial chemical treatment and maintain water quality in ranges noted above for the first year of operation.

E. Fill systems that have antifreeze or glycol solutions with the following concentrations:

1. Hot-Water Heating Piping: Minimum of 40 percent propylene glycol.
2. Chilled-Water Piping: Minimum of 40 percent propylene glycol.
3. Dual-Temperature Heating and Cooling Water Piping: Minimum of 40 percent propylene glycol.
4. Glycol Cooling-Water Piping: Minimum of 40 percent propylene glycol.

3.8 FIELD QUALITY CONTROL

A. Prepare hydronic piping according to ASME B31.9 and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
3. Flush hydronic piping systems with clean water; then remove and clean or replace strainer screens.
4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or another source of overpressure during test.

B. Perform the following tests on hydronic piping:

1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
2. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
3. Isolate expansion tanks and determine that hydronic system is full of water.
4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the system's working pressure. Test pressure shall not exceed maximum pressure for any

vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times the "SE" value in Appendix A in ASME B31.9, "Building Services Piping."

5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
6. Prepare written report of testing.

C. Perform the following before operating the system:

1. Open manual valves fully.
2. Inspect pumps for proper rotation.
3. Set makeup pressure-reducing valves for required system pressure.
4. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
5. Set temperature controls so all coils are calling for full flow.
6. Inspect and set operating temperatures of hydronic equipment, such as boilers, chillers, cooling towers, to specified values.
7. Verify lubrication of motors and bearings.

SECTION 232116 - HYDRONIC PIPING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Hydronic specialty valves.
2. Air-control devices.
3. Strainers.
4. Connectors.

B. Related Requirements:

1. Section 230523.12 "Ball Valves for HVAC Piping" for specification and installation requirements for ball valves common to most piping systems.
2. Section 230523.13 "Butterfly Valves for HVAC Piping" for specification and installation requirements for butterfly valves common to most piping systems.
3. Section 230923.11 "Control Valves" for automatic control valve and sensor specifications, installation requirements, and locations.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product:

1. Include construction details and material descriptions for hydronic piping specialties.
2. Include rated capacities, operating characteristics, and furnished specialties and accessories.
3. Include flow and pressure drop curves based on manufacturer's testing for calibrated-orifice balancing valves and automatic flow-control valves.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For hydronic piping specialties to include in emergency, operation, and maintenance manuals.

© 2026 CDM Smith
All Rights Reserved

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Differential Pressure Meter: For each type of balancing valve and automatic flow control valve, include flowmeter, probes, hoses, flow charts, and carrying case.

1.6 QUALITY ASSURANCE

A. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code: Section IX.

B. Safety Valves and Pressure Vessels: Shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

PART 2 - PRODUCTS

2.1 HYDRONIC SPECIALTY VALVES

A. Bronze, Calibrated-Orifice, Balancing Valves:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Bell & Gossett; a Xylem brand; CB or a comparable product by one of the following:

    a. Taco Comfort Solutions.
    b. WATTS.

2. Body: Bronze, ball or plug type with calibrated orifice or venturi.
3. Ball: Brass or stainless steel.
4. Plug: Resin.
5. Seat: PTFE.
6. End Connections: Threaded or socket.
7. Pressure Gage Connections: Integral seals for portable differential pressure meter.
8. Handle Style: Lever, with memory stop to retain set position.
9. CWP Rating: Minimum 125 psig.
10. Maximum Operating Temperature: 250 deg F.

B. Cast-Iron or Steel, Calibrated-Orifice, Balancing Valves:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Bell & Gossett; a Xylem brand; CB or a comparable product by one of the following:

    a. Victaulic Company.
    b. WATTS.

2. Body: Cast-iron or steel body, ball, plug, or globe pattern with calibrated orifice or venturi.
3. Ball: Brass or stainless steel.
4. Stem Seals: EPDM O-rings.
5. Disc: Glass and carbon-filled PTFE.

6. Seat: PTFE.
7. End Connections: Flanged or grooved.
8. Pressure Gage Connections: Integral seals for portable differential pressure meter.
9. Handle Style: Lever, with memory stop to retain set position.
10. CWP Rating: Minimum 125 psig.
11. Maximum Operating Temperature: 250 deg F.

2.2 AIR-CONTROL DEVICES

A. Manual Air Vents:

1. Body: Bronze.
2. Internal Parts: Nonferrous.
3. Operator: Screwdriver or thumbscrew.
4. Inlet Connection: NPS 1/2.
5. Discharge Connection: NPS 1/8.
6. CWP Rating: 150 psig.
7. Maximum Operating Temperature: 225 deg F.

B. Automatic Air Vents:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Bell & Gossett; a Xylem brand; No. 97 or a comparable product by one of the following:

    a. Spirotherm, Inc.
    b. Taco Comfort Solutions.
    c. WATTS.

2. Body: Bronze or cast iron.
3. Internal Parts: Nonferrous.
4. Operator: Noncorrosive metal float.
5. Inlet Connection: NPS 1/2.
6. Discharge Connection: NPS 1/4.
7. CWP Rating: 150 psig.
8. Maximum Operating Temperature: 240 deg F.

C. Bladder-Type ASME Expansion Tanks:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Bell & Gossett; a Xylem brand; Series B or a comparable product by one of the following:

    a. AMTROL, Inc.
    b. Taco Comfort Solutions.
    c. WATTS.

2. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature. Factory test after taps are fabricated and supports installed and are labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
3. Bladder: Securely sealed into tank to separate air charge from system water to maintain required expansion capacity.

4. Air-Charge Fittings: Schrader valve, stainless steel with EPDM seats.

D. Coalescing-Type Air and Dirt Separators:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Spirotherm; Series VDT or a comparable product by one of the following:

   a. AMTROL, Inc.
   b. Taco Comfort Solutions.
   c. WATTS.

2. Tank: Fabricated steel tank; ASME constructed and stamped for 125-psig (862-kPa) working pressure and 270 deg F (130 deg C) maximum operating temperature.
3. Coalescing Medium: Stainless steel.
4. Air Vent: Threaded to the top of the separator.
5. Inline Inlet and Outlet Connections: Threaded for NPS 2 (DN 50) and smaller; Class 150 flanged connections for NPS 2-1/2 (DN 65) and larger.
6. Blowdown Connection: Threaded to the bottom of the separator.
7. Size: Match system flow capacity.

2.3 STRAINERS

A. Cast Iron Y-Pattern Strainers for Steel Piping:

1. Body: ASTM A126, Class B, cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: Stainless-steel, 40-mesh strainer or perforated stainless-steel basket.
4. CWP Rating: 125 psig.

B. Bronze Y-Pattern Strainers for Copper Tubing:

1. Body: ASTM B584 Cast Bronze
2. End Connections: Threaded.
3. Strainer Screen: Stainless-steel, 20-mesh strainer, or perforated stainless-steel basket.
4. CWP Rating: 125 psig.

2.4 CONNECTORS

A. Stainless-Steel Bellow, Flexible Connectors:

1. Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket.
2. End Connections: Threaded or flanged to match equipment connected.
3. Performance: Capable of 3/4-inch misalignment.
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F.

B. Spherical, Rubber, Flexible Connectors:

1. Body: Fiber-reinforced rubber body.
2. End Connections: Steel flanges drilled to align with Classes 150 and 300 steel flanges.
3. Performance: Capable of misalignment, (shall not be used to connect misaligned parts).
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F.

PART 3 - EXECUTION

3.1 VALVE APPLICATIONS

A. Install shutoff-duty valves at each branch connection to supply mains and at supply connection to each piece of equipment.

B. Install calibrated-orifice, balancing valves in the return pipe of each heating or cooling terminal.

3.2 HYDRONIC SPECIALTIES INSTALLATION

A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.

B. Install automatic air vents at high points of system piping in mechanical equipment rooms only. Install manual vents at heat-transfer coils and elsewhere as required for air venting.

C. Install piping from boiler air outlet, air separator, or air purger to expansion tank with a 2 percent upward slope toward tank.

D. Install cast iron Y-pattern strainers in steel piping systems, and bronze Y-pattern strainers in copper tubing systems.

SECTION 232123 - HYDRONIC PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Close-coupled, in-line centrifugal pumps.
2. Separately coupled, vertically mounted, in-line centrifugal pumps.

1.3 DEFINITIONS

A. ECM: Electronically commutated motor.

B. EPDM: Ethylene propylene diene monomer.

C. EPR: Ethylene propylene rubber.

D. FKM: Fluoroelastomer polymer.

E. HI: Hydraulic Institute.

F. NBR: Nitrile rubber or Buna-N

1.4 ACTION SUBMITTALS

A. Product Data: For each type of pump.

1. Include certified performance curves and rated capacities, operating characteristics, furnished specialties, final impeller dimensions, and accessories for each type of product indicated.
2. Indicate pump's operating point on curves.

a. Show pump runout GPM.
b. Show NPSH required.
c. Show maximum BHP
d. Show motor selection with volts, phase and cycle.
e. Show shutoff head submergence for vertical turbine pumps.

B. Shop Drawings: For each pump.

1. Show pump layout and connections.
2. Include setting drawings with templates for installing foundation and anchor bolts and other anchorages.
3. Include diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For pumps to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Mechanical Seals: One mechanical seal(s) for each pump.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 CLOSE-COUPLED, IN-LINE CENTRIFUGAL PUMPS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Armstrong.
2. Bell and Gosset.
3. Taco.

B. Source Limitations: Obtain pumps from single source and from single manufacturer.

C. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, close-coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted horizontally or vertically.

D. Pump Construction:

1. Casing: Radially split, cast iron, with threaded gauge tappings at inlet and outlet, replaceable bronze wear rings, and threaded union-end connections.
2. Impeller: ASTM B584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. For constant-speed pumps, trim impeller to match specified performance.
3. Pump Shaft Sleeve: Type 304 stainless steel.
4. Pump Stub Shaft: Type 304 stainless steel.
5. Seal: Mechanical seal consisting of carbon rotating ring against a ceramic seat held by a stainless steel spring, and EPDM rubber bellows and gasket. Include water slinger on shaft between motor and seal.
6. Seal Flushing: Flush, cool, and lubricate pump seal by directing pump discharge water to flow over the seal.
7. Pump Bearings: Permanently lubricated ball bearings.

E. Shaft Coupling: Rigid, axially-split spacer coupling to allow service of pump seal without disturbing pump or motor.

F. Motor: Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

1. Enclosure: Totally enclosed, fan cooled.
2. NEMA Premium Efficient motors as defined in NEMA MG 1.
3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
5. Single-speed motor.

2.3 SEPARATELY COUPLED, VERTICALLY MOUNTED, IN-LINE CENTRIFUGAL PUMPS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Armstrong.
2. Bell and Gosset.
3. Taco.

B. Source Limitations: Obtain pumps from single source and from single manufacturer.

C. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, separately coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted vertically.

D. Pump Construction:

1. Casing: Radially split, cast iron, with threaded gauge tappings at inlet and outlet, replaceable bronze wear rings, and threaded companion-flange connections.

2. Impeller: ASTM B584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. For pumps that are not frequency-drive controlled, trim impeller to match specified performance.
3. Pump Shaft: Type 304 stainless steel.
4. Seal: Mechanical seal consisting of carbon rotating ring against a ceramic seat held by a stainless steel spring, and EPDM bellows and gasket.
5. Pump Bearings: Re-greaseable ball bearings.

E. Shaft Coupling: Molded-rubber insert with interlocking spider capable of absorbing vibration.

F. Motor: Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

1. Enclosure: Totally enclosed, fan cooled.
2. NEMA Premium Efficient motors as defined in NEMA MG 1.
3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
5. Single or Variable-speed motor.
6. Provide integral pump motor variable-speed controller.

2.4 PUMP SPECIALTY FITTINGS

A. Suction Diffuser:

1. Angle pattern.
2. 175-psig pressure rating, ductile-iron body and end cap, pump-inlet fitting.
3. Bronze 16-mesh wire startup and Type 304 stainless steel permanent strainers with 3/16-inch.
4. Type 304 stainless steel straightening vanes.
5. Drain plug.
6. Factory-fabricated support.

B. Triple-Duty Valve:

1. Angle or straight pattern.
2. 175-psig pressure rating, ductile-iron body, pump-discharge fitting.
3. Valve with multi-turn stem and memory stop to allow valve to be returned to its original position after shutoff.
4. Brass valve disc with EPDM rubber seat.
5. Type 304 stainless steel valve stem.
6. Drain plug and bronze-fitted shutoff, balancing, and check valve features.
7. Brass gauge ports with integral check valve and orifice for flow measurement.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.

C. Examine foundations and inertia bases for suitable conditions where pumps will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PUMP INSTALLATION

A. Comply with HI 1.4.

B. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.

C. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.

D. Equipment Mounting:

1. Install base-mounted pumps on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
2. Comply with requirements for vibration isolation devices specified in Section 230548.13 "Vibration Controls for HVAC."

E. Equipment Mounting: Install in-line pumps with continuous-thread hanger rods and spring hangers of size required to support weight of in-line pumps.

1. Comply with requirements for hangers and supports specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."

3.3 ALIGNMENT

A. Engage a factory-authorized service representative to perform alignment service.

B. Perform alignment service. When required by manufacturer to maintain warranty coverage, engage a factory-authorized service representative to perform it.

C. Comply with requirements in HI standards for alignment of pump and motor shaft. Add shims to the motor feet and bolt motor to base frame. Do not use grout between motor feet and base frame.

D. Comply with pump and coupling manufacturers' written instructions.

E. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with nonshrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

3.4 PIPING CONNECTIONS

A. Comply with requirements for piping specified in Section 232213 "Steam and Condensate Heating Piping" and Section 232216 "Steam and Condensate Piping Specialties." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to pump, allow space for service and maintenance.

C. Connect piping to pumps. Install valves that are same size as piping connected to pumps.

D. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.

E. Install triple-duty valve on discharge side of pumps.

F. Install Y-type strainer or suction diffuser and shutoff valve on suction side of pumps.

1. Use startup strainer for initial system startup. Install permanent strainer element before turnover of system to Owner.

G. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

H. Install pressure gauges on pump suction and discharge or at integral pressure-gauge tapping, or install single gauge with multiple-input selector valve.

I. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

J. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.5 ELECTRICAL CONNECTIONS

A. Connect wiring in accordance with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

B. Ground equipment in accordance with Section 260526 "Grounding and Bonding for Electrical Systems."

C. Install electrical devices furnished by manufacturer, but not factory mounted, in accordance with NFPA 70 and NECA 1.

D. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.

1. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.

3.6 CONTROL CONNECTIONS

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring in accordance with Section 260523 "Control-Voltage Electrical Power Cables."

3.7 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks in accordance with manufacturer's written instructions.
2. Check piping connections for tightness.
3. Clean strainers on suction piping. Use startup strainer for initial startup.
4. Perform the following startup checks for each pump before starting:

    a. Verify bearing lubrication.
    b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
    c. Verify that pump is rotating in correct direction.

5. Prime pump by opening suction valves and closing drains, and prepare pump for operation.
6. Start motor.
7. Open discharge valve slowly.

3.8 FIELD QUALITY CONTROL

A. Perform tests and inspections with the assistance of a factory-authorized service representative.

B. Hydronic pumps will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

3.9 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain hydronic pumps.

SECTION 232213 - STEAM AND CONDENSATE HEATING PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes pipe and fittings for steam and condensate piping:

1. Steel pipe and fittings.
2. Joining materials.

B. Related Requirements:

1. Section 232216 "Steam and Condensate Heating Piping Specialties" for strainers, flash tanks, special-duty valves, steam traps, thermostatic air vents and vacuum breakers, and steam and condensate meters.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of the following:

1. Steel pipe and fitting.
2. Joining material.

1.4 DELEGATED-DESIGN SUBMITTAL

A. Design calculations and detailed fabrication and assembly of pipe anchors and alignment guides, hangers and supports for multiple pipes, expansion joints and loops, and attachments of the same to the building structure.

B. Locations of pipe anchors and alignment guides and expansion joints and loops.

C. Locations of and details for penetrations, including sleeves and sleeve seals for exterior walls, floors, basement, and foundation walls.

D. Locations of and details for penetration and firestopping for fire- and smoke-rated wall and floor and ceiling assemblies.

© 2026 CDM Smith
All Rights Reserved

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Welding certificates.

C. Field quality-control reports.

D. Welding inspector certification.

1.6 QUALITY ASSURANCE

A. Steel Support Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Pipe Welding: Qualify procedures and operators according to the following:

1. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation.
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
3. Certify that each welding inspector has current AWS qualifications.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressures and temperatures unless otherwise indicated:

1. LP Steam Piping: 15 psig.
2. Condensate Piping: 250 deg F.
3. Air-Vent and Vacuum-Breaker Piping: Equal to pressure of the piping system to which it is attached.
4. Safety-Valve-Inlet and -Outlet Piping: Equal to pressure of the piping system to which it is attached.

2.2 STEEL PIPE AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel, plain ends, welded and seamless, Grade B, and Schedule as indicated in piping applications articles.

B. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125, 150, and 300 as indicated in piping applications articles.

C. Malleable-Iron Threaded Fittings: ASME B16.3; Classes 150 and 300 as indicated in piping applications articles.

D. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in piping applications articles.

E. Cast-Iron Threaded Flanges and Flanged Fittings: ASME B16.1, Classes 125 and 250 as indicated in piping applications articles; raised ground face, and bolt holes spot faced.

F. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.

G. Wrought-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:

1. Material Group: 1.1.
2. End Connections: Butt welding.
3. Facings: Raised face.

H. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, black steel of same Type, Grade, and Schedule as pipe in which installed.

2.3 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless otherwise indicated.

a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

D. Welding Materials: Comply with Section II, Part C, of ASME Boiler and Pressure Vessel Code for welding materials appropriate for wall thickness and for chemical analysis of pipe being welded.

PART 3 - EXECUTION

3.1 LP STEAM PIPING APPLICATIONS

A. LP Steam Piping, NPS 2 and Smaller: Schedule 40, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

B. LP Steam Piping, NPS 2-1/2 through NPS 18: Schedule 40, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.

C. Condensate piping above grade, NPS 2 and smaller, shall be the following:

1. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.

3.2 ANCILLARY PIPING APPLICATIONS

A. Blowdown-Drain Piping: Same materials and joining methods as for piping specified for the service in which blowdown drain is installed.

B. Vacuum-Breaker Piping: Outlet, same as service where installed.

C. Safety-Valve-Inlet and -Outlet Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed.

3.3 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless otherwise indicated.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping free of sags and bends.

G. Install fittings for changes in direction and branch connections.

H. Install piping to allow application of insulation.

I. Select system components with pressure rating equal to or greater than system operating pressure.

J. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

K. Install drains, consisting of a tee fitting, NPS 3/4 full port-ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

L. Install steam supply piping at a minimum uniform grade of 0.2 percent downward in direction of steam flow.

M. Install condensate return piping at a minimum uniform grade of 0.4 percent downward in direction of condensate flow.

N. Reduce pipe sizes using eccentric reducer fitting installed with level side down.

O. Install steam branch connections to mains using tee fittings in main pipe, with the branch connected to top of main pipe. Provide a minimum of two elbows "Z", for horizontal branch connections and full "swing joints" for branch connections to risers.

P. Install valves according to the following Sections or other Sections as needed:

1. Section 230523.11 "Globe Valves for HVAC Piping."
2. Section 230523.12 "Ball Valves for HVAC Piping."
3. Section 230523.13 "Butterfly Valves for HVAC Piping."
4. Section 230523.14 "Check Valves for HVAC Piping."
5. Section 230523.15 "Gate Valves for HVAC Piping."

Q. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.

R. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

S. Install shutoff valve immediately upstream of each dielectric fitting.

T. Install strainers on supply side of control valves, pressure-reducing valves, traps, and elsewhere as indicated. Install NPS 3/4 nipple and full port ball valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.

U. Comply with requirements in Section 230516 "Expansion Fittings and Loops for HVAC Piping" for installation of expansion loops, expansion joints, anchors, and pipe alignment guides.

V. Comply with requirements in Section 230553 "Identification for HVAC Piping and Equipment" for identifying piping.

W. Install drip legs at low points and natural drainage points such as ends of mains, bottoms of risers, and ahead of pressure regulators, and control valves.

1. On straight runs with no natural drainage points, install drip legs at intervals not exceeding 300 feet.
2. Size drip legs same size as main. In steam mains NPS 6 and larger, drip leg size can be reduced, but to no less than NPS 4.

X. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 230517 "Sleeves and Sleeve Seals for HVAC Piping."

Y. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 230517 "Sleeves and Sleeve Seals for HVAC Piping."

© 2026 CDM Smith
All Rights Reserved

3.4 STEAM AND CONDENSATE PIPING SPECIALTIES INSTALLATION

A. Comply with requirements in Section 232216 "Steam and Condensate Heating Piping Specialties" for installation requirements for strainers, flash tanks, special-duty valves, steam traps, thermostatic air vents and vacuum breakers, and steam and condensate meters.

3.5 INSTALLATION OF HANGERS AND SUPPORTS

A. Comply with requirements in Section 230529 "Hangers and Supports for HVAC Piping and Equipment" for installation of hangers, supports, and anchor devices.

B. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
4. Spring hangers to support vertical runs.

C. Install hangers for steel steam supply piping and steel steam condensate piping, with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

D. Install hangers for fiberglass piping, with maximum horizontal spacing and minimum rod diameters, to comply with manufacturer's written instructions, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

E. Support horizontal piping within 12 inches of each fitting.

F. Support vertical runs of steel steam supply piping and steel steam condensate piping to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

G. Support vertical runs of fiberglass piping to comply with manufacturer's written instructions, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

3.6 PIPE JOINT CONSTRUCTION

A. Ream ends of pipes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

D. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.

E. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.7 TERMINAL EQUIPMENT CONNECTIONS

A. Size for supply and return piping connections shall be the same as or larger than equipment connections.

B. Install traps and control valves in accessible locations close to connected equipment.

C. Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required.

D. Install vacuum breakers downstream from control valve, close to coil inlet connection, or on the coil.

E. Install a drip leg at coil outlet.

3.8 FIELD QUALITY CONTROL

A. Prepare steam and condensate piping according to ASME B31.9, "Building Services Piping," and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
3. Flush system with clean water. Clean strainers.
4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.

B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Perform the following tests and inspections:

1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
2. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the working pressure. Test pressure shall not exceed maximum pressure for any vessel,

pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength.

3. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.

E. Prepare test and inspection reports.

END OF SECTION 232213

SECTION 232216 - STEAM AND CONDENSATE HEATING PIPING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the following piping specialties for steam and condensate piping:

1. Y-Pattern Strainer
2. Steam traps.
3. Thermostatic air vents and vacuum breakers.

B. Related Requirements:

1. Section 230516 "Expansion Fittings and Loops for HVAC Piping" for expansion fittings and loops.
2. Section 230523.12 "Ball Valves for HVAC Piping" for specification and installation requirements for ball valves common to most piping systems.
3. Section 230523.13 "Butterfly Valves for HVAC Piping" for specification and installation requirements for butterfly valves common to most piping systems.
4. Section 230523.14 "Check Valves for HVAC Piping" for specification and installation requirements for check valves common to most piping systems.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Strainer.
2. Steam trap.
3. Air vent and vacuum breaker.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For valves, safety valves, pressure-reducing valves, steam traps, air vents, vacuum breakers, and meters to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Pipe Welding: Qualify procedures and operators according to the following:

1. ASME Compliance: Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp flash tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressures and temperatures unless otherwise indicated:

1. LP Steam Piping: 15 psig.
2. Condensate Piping: 15 psig at 250 deg F.
3. Blowdown-Drain Piping: Equal to pressure of the piping system to which it is attached.
4. Air-Vent and Vacuum-Breaker Piping: Equal to pressure of the piping system to which it is attached.
5. Safety-Valve-Inlet and -Outlet Piping: Equal to pressure of the piping system to which it is attached.

2.2 STRAINERS

A. Y-Pattern Strainers:

1. Body: ASTM A 126, Class B cast iron, with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.
3. Strainer Screen: Stainless-steel, 20-mesh strainer or perforated stainless-steel basket.
4. Tapped blowoff plug.
5. CWP Rating: 250-psig working steam pressure.

2.3 STEAM TRAPS

A. Float and Thermostatic Steam Traps:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Armstrong International, Inc.
    b. Hoffman Specialty.
    c. Spirax Sarco, Inc.

2. Body and Bolted Cap: ASTM A 126 cast iron.
3. End Connections: Threaded.
4. Float Mechanism: Replaceable, stainless steel.
5. Head and Seat: Hardened stainless steel.
6. Trap Type: Balanced pressure.
7. Thermostatic Bellows: Stainless steel or monel.

8. Thermostatic air vent capable of withstanding 45 deg F of superheat and resisting water hammer without sustaining damage.
9. Vacuum Breaker: Thermostatic with phosphor bronze bellows, and stainless-steel cage, valve, and seat.
10. Maximum Operating Pressure: 125 psig.

B. Inverted Bucket Steam Traps:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

   a. Armstrong International, Inc.
   b. Hoffman Specialty.
   c. Spirax Sarco, Inc.

2. Body and Cap: Cast iron.
3. End Connections: Threaded.
4. Head and Seat: Stainless steel.
5. Valve Retainer, Lever, and Guide Pin Assembly: Stainless steel.
6. Bucket: Brass or stainless steel.
7. Strainer: Integral stainless-steel inlet strainer within the trap body.
8. Air Vent: Stainless-steel thermostatic vent.
9. Pressure Rating: 250 psig.

2.4 THERMOSTATIC AIR VENTS AND VACUUM BREAKERS

A. Thermostatic Air Vents:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

   a. Armstrong International, Inc.
   b. Hoffman Specialty.
   c. Spirax Sarco, Inc.

2. Body: Cast iron, bronze, or stainless steel.
3. End Connections: Threaded.
4. Float, Valve, and Seat: Stainless steel.
5. Thermostatic Element: Phosphor bronze bellows in a stainless-steel cage.
6. Pressure Rating: 125 psig.
7. Maximum Temperature Rating: 350 deg F.

B. Vacuum Breakers:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Armstrong International, Inc.
b. Hoffman Specialty.
c. Spirax Sarco, Inc.

2. Body: Cast iron, bronze, or stainless steel.
3. End Connections: Threaded.
4. Sealing Ball, Retainer, Spring, and Screen: Stainless steel.
5. O-Ring Seal: Ethylene propylene rubber.
6. Pressure Rating: 125 psig.
7. Maximum Temperature Rating: 350 deg F.

PART 3 - EXECUTION

3.1 VALVE APPLICATIONS

A. Install shutoff duty valves at branch connections to steam supply mains, at steam supply connections to equipment, and at the outlet of steam traps.

3.2 PIPING INSTALLATION

A. Install piping to permit valve servicing.

B. Install drains, consisting of a tee fitting, NPS 3/4 full-port ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

C. Install valves according to Section 230523.11 "Globe Valves for HVAC Piping," Section 230523.12 "Ball Valves for HVAC Piping," Section 230523.13 "Butterfly Valves for HVAC Piping," Section 230523.14 "Check Valves for HVAC Piping," and Section 230523.15 "Gate Valves for HVAC Piping."

D. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment and elsewhere as indicated.

E. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

F. Install shutoff valve immediately upstream of each dielectric fitting.

G. Install strainers on supply side of control valves, pressure-reducing valves, traps, and elsewhere as indicated. Install NPS 3/4 nipple and full-port ball valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.

3.3 STEAM-TRAP INSTALLATION

A. Install steam traps in accessible locations as close as possible to connected equipment.

© 2026 CDM Smith
All Rights Reserved

B. Install full-port ball valve, strainer, and union upstream from trap; install union, check valve, and full-port ball valve downstream from trap unless otherwise indicated.

SECTION 232223 - STEAM CONDENSATE PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes steam condensate pumps.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include certified performance curves and rated capacities, operating characteristics, furnished specialties, and accessories for each type of product indicated. Indicate pump's operating point on curves. Include receiver capacity and material.

B. Shop Drawings: For each pump.

1. Show pump layout and connections.
2. Include setting drawings with templates for installing foundation and anchor bolts and other anchorages.
3. Include diagrams for power, signal, and control wiring.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For pumps to include in emergency, operation, and maintenance manuals.

PART 2 - PRODUCTS

2.1 SINGLE-STAGE, CENTRIFUGAL PUMPS WITH ELEVATED RECEIVER

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. ITT Corporation.
2. Skidmore Pump.
3. Spirax Sarco Limited.
4. Sterling.

B. Description: Factory-fabricated, packaged, electric-driven pumps; with receiver, pumps, controls, and accessories suitable for operation with steam condensate.

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. ASME Compliance: Fabricate and label steam condensate receivers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

C. Configuration: Duplex floor-mounted pump with elevated receiver, float switches, and connecting piping; rated to pump 212 deg F steam condensate.

D. Receiver:

1. Mounted on fabricated-steel supports.
2. Close-grained cast iron.
3. Externally adjustable float switches.
4. Water-level gage and dial thermometer.
5. Pressure gage at pump discharge.
6. Bronze isolation valves between receiver and pumps.
7. Lifting eyebolts.
8. Inlet cascade baffle and convex heads.
9. Cast-iron inlet strainer with self-cleaning bronze screen, dirt pocket, and cleanout plug on receiver inlet.

E. Pumps:

1. Centrifugal, close coupled.
2. Permanently aligned.
3. Bronze fitted with enclosed bronze impellers.
4. Replaceable bronze case rings.
5. Stainless-steel shafts.
6. Mechanical seals rated at 250 deg F.
7. Mounted on base below receiver.
8. Rated to operate with a minimum of 2 feet of NPSH.

F. Motor:

1. Enclosure: Totally enclosed, fan cooled.

G. Pipe: ASTM A53/A53M, Type S, Grade B or ASTM A106/A106M; Schedule 80; seamless steel.

H. Fittings NPS 2 and Smaller: ASME B16.1, Class 125 cast iron, threaded.

I. Fittings NPS 2-1/2 and Larger: ASTM A234/A234M, steel, for welded connections.

J. Control Panel:

1. Factory wired between pumps and float switches, for single external electrical connection.

2. Provide fused, control-power transformer if voltage exceeds 230 V ac.
3. NEMA 250, Type 4X enclosure with hinged door and grounding lug, mounted on pump.
4. Motor controller for each pump.
5. Electrical pump alternator.
6. Numbered terminal strip.
7. Disconnect switch.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install pumps according to HI 1.1-1.2, HI 1.3, and HI 1.4.

B. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.

C. Support pumps and piping separately so piping is not supported by pumps.

D. Install thermometers and pressure gages.

E. Equipment Mounting:

1. Comply with requirements for vibration isolation devices specified in Section 230548.13 "Vibration Controls for HVAC."

3.3 CONNECTIONS

A. Comply with requirements for piping specified in Section 232213 "Steam and Condensate Heating Piping" and Section 232216 "Steam and Condensate Heating Piping Specialties."

B. Where installing piping adjacent to machine, allow space for service and maintenance.

C. Install a ball and check valve at pump outlet.

D. Pipe drain to nearest floor drain for overflow and drain piping connections.

E. Install full-size vent piping, terminating in 180-degree elbow at point above highest steam system connection or as indicated.

F. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

G. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Clean strainers.
3. Set steam condensate pump controls.
4. Set pump controls for automatic start, stop, and alarm operation.
5. Perform the following preventive maintenance operations and checks before starting:

    a. Set float switches to operate at proper levels.
    b. Set throttling valves on pump discharge for specified flow.
    c. Check motors for proper rotation.
    d. Test pump controls and demonstrate compliance with requirements.
    e. Replace damaged or malfunctioning pump controls and equipment.
    f. Verify that pump controls are correct for required application.

6. Start steam condensate pumps according to manufacturer's written startup instructions.

3.5 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain steam condensate pumps.

SECTION 233113 - METAL DUCTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Single-wall rectangular ducts and fittings.
2. Single-wall round ducts and fittings.
3. Sheet metal materials.
4. Sealants and gaskets.
5. Hangers and supports.
6. Delegated Design.

B. Related Sections:

1. Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing requirements for metal ducts.
2. Section 233300 "Air Duct Accessories" for dampers, sound-control devices, duct-mounting access doors and panels, turning vanes, and flexible ducts.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of the following products:

1. Liners and adhesives.
2. Sealants and gaskets.

B. Shop Drawings:

1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
2. Factory- and shop-fabricated ducts and fittings.
3. Duct layout indicating sizes, configuration, liner material, and static-pressure classes.
4. Elevation of top of ducts.
5. Dimensions of all duct runs from building grid lines.
6. Fittings.
7. Reinforcement and spacing.
8. Seam and joint construction.
9. Penetrations through fire-rated and other partitions.
10. Equipment installation based on equipment being used on Project.

11. Locations for duct accessories, including dampers, turning vanes, and access doors and panels.
12. Hangers and supports, including methods for duct and building attachment and vibration isolation.

1.4 DELEGATED DESIGN SUBMITTALS

A. Sheet metal thicknesses.

B. Joint and seam construction and sealing.

C. Reinforcement details and spacing.

D. Materials, fabrication, assembly, and spacing of hangers and supports.

E. Design Calculations: Calculations for selecting hangers and supports.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: A single set of plans or BIM model, drawn to scale, showing the items described in this Section, and coordinated with all building trades.

B. Welding certificates.

C. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel in accordance with the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports.
2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum," for aluminum supports.
3. AWS D9.1/D9.1M, "Sheet Metal Welding Code," for duct joint and seam welding.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Duct Design: Engage a qualified professional engineer, as defined in Section 014000 “Quality Requirements” to design the following:

1. Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and with performance requirements and design criteria indicated in "Duct Schedule" Article.

B. Structural Performance: Duct hangers and supports shall withstand the effects of gravity loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and New York State Mechanical Code.

C. Airstream Surfaces: Surfaces in contact with airstream shall comply with requirements in ASHRAE 62.1.

D. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment," and Section 7 - "Construction and System Startup."

E. ASHRAE/IES Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."

F. Duct Dimensions: Unless otherwise indicated, all duct dimensions indicated on Drawings are inside clear dimensions and do not include insulation or duct wall thickness.

2.2 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.

1. Construct ducts of galvanized sheet steel unless otherwise indicated.
2. For ducts exposed to weather, construct of Type 304 stainless steel indicated by manufacturer to be suitable for outdoor installation.

B. Transverse Joints: Fabricate joints in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-1, "Rectangular Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

1. For ducts with longest side less than 36 inches, select joint types in accordance with Figure 2-1.
2. For ducts with longest side 36 inches or greater, use flange joint connector Type T-22, T-24, T-24A, T-25a, or T-25b. Factory-fabricated flanged duct connection system may be used if submitted and approved by engineer of record.

C. Longitudinal Seams: Select seam types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible." All longitudinal seams shall be Pittsburgh lock seams unless otherwise specified for specific application.

D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Ch. 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

© 2026 CDM Smith
All Rights Reserved

2.3 SHEET METAL MATERIALS

A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Comply with ASTM A653/A653M.

1. Galvanized Coating Designation: G90.
2. Finishes for Surfaces Exposed to View: Mill phosphatized.

C. Aluminum Sheets: Comply with ASTM B209 Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view.

D. Reinforcement Shapes and Plates: ASTM A36/A36M, steel plates, shapes, and bars; black and galvanized.

1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.

E. Tie Rods: Galvanized steel, 1/4-inch- minimum diameter for lengths 36 inches or less; 3/8-inch-minimum diameter for lengths longer than 36 inches.

2.4 SEALANT AND GASKETS

A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested in accordance with UL 723; certified by an NRTL.

B. Water-Based Joint and Seam Sealant:

1. Application Method: Brush on.
2. Solids Content: Minimum 65 percent.
3. Shore A Hardness: Minimum 20.
4. Water resistant.
5. Mold and mildew resistant.
6. VOC: Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10 inch wg, positive and negative.
8. Service: Indoor or outdoor.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

C. Solvent-Based Joint and Seam Sealant:

1. Application Method: Brush on.
2. Base: Synthetic rubber resin.
3. Solvent: Toluene and heptane.
4. Solids Content: Minimum 60 percent.
5. Shore A Hardness: Minimum 60.

6. Water resistant.
7. Mold and mildew resistant.
8. Maximum Static-Pressure Class: 10-inch wg, positive or negative.
9. Service: Indoor or outdoor.
10. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

D. Flanged Joint Sealant: Comply with ASTM C920.

1. General: Single-component, acid-curing, silicone, elastomeric.
2. Type: S.
3. Grade: NS.
4. Class: 25.
5. Use: O.

E. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

F. Round Duct Joint O-Ring Seals:

1. Seal shall provide maximum leakage class of 3 cfm/100 sq. ft. at 1-inch wg and shall be rated for10-inch wg static-pressure class, positive or negative.
2. EPDM O-ring to seal in concave bead in coupling or fitting spigot.
3. Double-lipped, EPDM O-ring seal, mechanically fastened to factory-fabricated couplings and fitting spigots.

2.5 HANGERS AND SUPPORTS

A. Hanger Rods for Noncorrosive Environments: Stainless-steel rods and nuts.

B. Hanger Rods for Corrosive Environments: Stainless steel, all-thread rods and nuts.

C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."

D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A603.

E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A492.

F. Steel Cable End Connections: Galvanized-steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

H. Trapeze and Riser Supports:

1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.
3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

PART 3 - EXECUTION

3.1 DUCT INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and coordination drawings.

B. Install ducts in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.

C. Install ducts in maximum practical lengths with fewest possible joints.

D. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.

E. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.

F. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

G. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.

H. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.

I. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.

J. Install fire and smoke dampers where indicated on Drawings and as required by code, and by local authorities having jurisdiction. Comply with requirements in Section 233300 "Air Duct Accessories" for fire and smoke dampers and specific installation requirements of the damper UL listing.

K. Install heating coils, cooling coils, air filters, dampers, and all other duct-mounted accessories in air ducts where indicated on Drawings.

L. Elbows: Use long-radius elbows wherever they fit.

M. Branch Connections: Use lateral or conical branch connections.

3.2 INSTALLATION OF EXPOSED DUCTWORK

A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.

B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.

C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.

D. Maintain consistency, symmetry, and uniformity in arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.

E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.3 DUCTWORK EXPOSED TO WEATHER

A. All external joints are to have secure watertight mechanical connections. Seal all openings to provide weatherproof construction.

B. Construct ductwork to resist external loads of wind, snow, ice, and other effects of weather. Provide necessary supporting structures.

C. Single Wall:

1. Ductwork shall be Type 304 stainless steel.
2. Where ducts have external insulation, provide weatherproof aluminum jacket. See Section 230713 "Duct Insulation."

3.4 DUCT SEALING

A. Seal ducts at a minimum to the following seal classes in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible":

1. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
2. Outdoor, Supply-Air Ducts: Seal Class A.
3. Outdoor, Exhaust Ducts: Seal Class C.
4. Outdoor, Return-Air Ducts: Seal Class C.
5. Unconditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class B.
6. Unconditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class A.
7. Unconditioned Space, Exhaust Ducts: Seal Class C.
8. Unconditioned Space, Return-Air Ducts: Seal Class B.
9. Conditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class C.
10. Conditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class B.
11. Conditioned Space, Exhaust Ducts: Seal Class B.
12. Conditioned Space, Return-Air Ducts: Seal Class C.

3.5 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.

1. Where practical, install concrete inserts before placing concrete.

C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.

D. Hangers Exposed to View: Threaded rod and angle or channel supports.

E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet.

F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.6 CONNECTIONS

A. Make connections to equipment with flexible connectors complying with Section 233300 "Air Duct Accessories."

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.7 PAINTING

A. Paint interior of metal ducts that are visible through registers and grilles and that do not have duct liner. Apply one coat of flat, black, latex paint over a compatible galvanized-steel primer. Paint materials and application requirements are specified in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."

3.8 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Leakage Tests:

1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
2. Test the following systems:

a. Ducts with a Pressure Class Higher Than 3-Inch wg: Test representative duct sections, selected by Engineer from sections installed, totaling no less than 25 percent of total installed duct area for each designated pressure class.

3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
4. Testing of each duct section is to be performed with access doors, coils, filters, dampers, and other duct-mounted devices in place as designed. No devices are to be removed or blanked off so as to reduce or prevent additional leakage.
5. Test for leaks before applying external insulation.
6. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
7. Give seven days' advance notice for testing.

C. Duct system will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.9 STARTUP

A. Air Balance: Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC."

3.10 DUCT SCHEDULE

A. See drawings for ductwork pressure class, seal class and leakage class.

SECTION 233116 - NONMETAL DUCTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Thermoset FRP ducts and fittings.

B. Related Sections:

1. Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing requirements for nonmetal ducts.
2. Section 233113 "Metal Ducts" for single- and double-wall, rectangular and round ducts.
3. Section 233300 "Air Duct Accessories" for dampers, duct-mounting access doors and panels, turning vanes, and flexible ducts.

1.3 REFERENCES

A. SMACNA Publications:

1. Thermoset FRP Duct Construction Manual.
2. Seismic Restraint Manual - Guidelines for Mechanical Systems.
3. Round Industrial Dust Construction Standards

B. ASTM Publications:

1. D2996 – Standard Specification for Filament-Wound "Fiberglass" (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe.
2. C581 – Standard Practice for Determining Chemical Resistance of Thermosetting Resins Used in Glass-Fiber-Reinforced Structures Intended for Liquid Service
3. D4097 – Standard Specification for Contact-Molded Glass-Fiber-Reinforced Thermoset Resin Corrosion-Resistant Tanks.
4. D3982 – Contact Molded “Fiberglass” (Glass Fiber Reinforced Thermosetting Resin) Ducts.
5. E84 – Standard Method of Testing for Surface Burning Characteristics of Building Materials.
6. D3418 – Standard Test Method for Transition Temperatures and Enthalpies of Fusion and Crystallization of Polymers by Differential Scanning Calorimetry

C. FM Approval Standards:

1. FM 4910.
2. FM 4922.

1.4 COORDINATION

A. Coordinate the location of the duct joints and flanges to accommodate the construction sequencing requirements.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of the following products:

1. Thermoset FRP duct materials.

B. Shop Drawings:

1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
2. Duct layout indicating sizes and pressure classes.
3. Elevation of top of ducts.
4. Dimensions of main duct runs from building grid lines.
5. Fittings.
6. Reinforcement and spacing.
7. Seam and joint construction.
8. Penetrations through fire-rated and other partitions.
9. Hangers and supports, including methods for duct and building attachment and vibration isolation.

1.6 DELEGATED DESIGN SUBMITTALS

A. Delegation of Duct Design:

1. Calculation shall be to ASTM D3982 – Contact Molded “Fiberglass” (Glass Fiber Reinforced Thermosetting Resin) Ducts.
2. Duct materials and thicknesses.
3. Joint and seam construction and sealing.
4. Reinforcement details and spacing.
5. Design Calculations Submittals:

    a. Calculations, including analysis data, prepared by a qualified professional responsible for their preparation for designing the duct.

B. Delegation of Duct Supports:

1. Where the Drawings show support types and/or locations the delegated designer shall analyze the support types, locations, loads, and stresses for adequacy. The supports shall be modified, if required, installed, generally where shown.
2. Engage the services of an independent registered professional engineer, licensed in the of State of Connecticut, ordinarily engaged in the business of structural support design and

engineering to develop a detailed support system design, specific to the duct material, duct joints, and duct appurtenances proposed for use.

a. The proposed support engineer shall have at least 5 years of experience in the analysis and design of similar supports.

3. The support system design deliverables shall be an organized signed and sealed calculation and design package prepared by a Professional Engineer in the State of Connecticut that shall be submitted to the Engineer and will include:

a. A summary outlining design inputs, criteria, and assumptions made, organized by duct system.
b. Support calculations must include/consider duct dead weight, thermal expansion/contraction (if applicable), seismic (if applicable), wind (if applicable) effects.
c. A Nodal Map presenting each system in a graphical format showing the nodes that correspond with the selected and designed supports.
d. Coordinate support design and placement to eliminate clashes with existing or new infrastructure.

1) Complete duct support shop drawings shall be submitted.

1.7 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Duct installation in congested spaces, indicating coordination with general construction, building components, and other building services. Indicate proposed changes to duct layout.
2. Suspended ceiling components.
3. Structural members to which duct will be attached.
4. Size and location of initial access modules for acoustical tile.
5. Penetrations of smoke barriers and fire-rated construction.
6. Items penetrating finished ceiling including the following:

a. Lighting fixtures.
b. Air outlets and inlets.
c. Speakers.
d. Sprinklers.
e. Access panels.
f. Perimeter moldings.

B. Welding certificates.

C. Field quality-control reports.

© 2026 CDM Smith
All Rights Reserved

1.8 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports.

B. NFPA Compliance:

1. NFPA 91, "Standard for Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Particulate Solids."

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Duct Design: Duct construction, including duct closure, reinforcements, and hangers and supports, shall comply with SMACNA's "Fibrous Glass Duct Construction Standards" and performance requirements and design criteria indicated.

1. Static-Pressure Classes: -15-inch wg to +15-inch wg.

B. Structural Performance: Duct hangers and supports shall withstand the effects of gravity loads and stresses within limits and under conditions to comply with ASCE/SEI 7.

C. In general, provide substantially airtight FRP ductwork for any passageway used for conveying air, gas, or materials. Included are fittings, transitions, bracing, fasteners, sealers, and accessories such as access doors, turning vanes, and manual air balancing dampers. Provide ductwork of size and material as specified herein and as shown on the Drawings. All duct sizes indicated on the Drawings are clear, inside dimensions.

D. Submit for approval any change in duct sizes, offsets, transitions, and fittings that is required to accommodate job condition.

E. All ductwork, piping, and equipment shown on the Drawings is intended to be approximately correct to scale. Consult figured dimensions and detailed drawings of the furnished equipment for the actual dimensions and details. The sizes of ductwork and piping are shown, but the Drawings do not show every offset, fitting, hanger, or support that may be required. The Drawings do not show structural difficulties that may be encountered during construction. Furnish all necessary parts to make a complete working system ready for use without extra charge. Coordinate the system installation and routing with the work of all trades.

2.2 THERMOSET FRP DUCTS AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. ECS.
2. Daniel Company.
3. Belco Manufacturing.
4. Diamond Fiberglass.

5. Augusta Fiberglass
6. An-Cor.
7. Midwestern Fabricators.
8. Spunstrand.
9. Perry Fiberglass.
10. Or approved equal.

B. Duct and Fittings:

C. Duct and Fittings:

1. Thermoset FRP Resin:

a. Utilize corrosion-resistant vinyl ester resin with fire retardant. Utilize resin that does not require additives such as antimony which detract from visual inspection or deplete the corrosion resistance. Provide a resin that yields a translucent laminate.
b. Resins used in the laminate shall be premium corrosion resistant and fire retardant vinyl ester resin without the use of Antimony Trioxide additive. Resin shall be:

1) Derakane 510-B-400.
2) Cor VE 8401.
3) AOC Vipel K022.
4) Reichold's Dion Impact 9303-54.
5) Or equal.

c. The following materials are expected to be in the air stream or surrounding area. The resins used shall be suitable for all of the following:

1) Hydrogen Sulfide.
2) Organic compounds.

2. Round Duct: ASTM D2996, Type I, Grade 2, Class E, filament-wound duct, minimum wall thickness as follows, with tapered bell and spigot ends for adhesive joints, or plain ends with couplings.

a. Duct Thickness:

1) Based on 10:1 safety factor for pressure service and 5:1 safety factor for vacuum service.
2) Minimum Round Duct Wall Thickness:

a) 0-23 inch diameter: 0.225 inch.
b) 24-30 inch diameter: 0.275 inch.
c) 32-42 inch diameter: 0.375 inch.
d) 44-60 inch diameter: 0.525 inch.
e) 62 inches and greater diameter: 0.625 inch.

3. Laminates shall consist of a 20 mil (finished thickness) minimum chemical resistant interior liner with an apertured synthetic surface veil embedded in a resin rich surface. The corrosion barrier shall be a minimum of 100 mils thick and include not less than two

layers of 1-1/2 oz mat with 25 percent glass and 75 percent resin content. The structural layer shall be Type E filament winding glass or alternating layers of chopped strand mat and woven roving of sufficient thickness to meet the minimum thickness requirements specified. The exterior surface layer shall be resin rich “C” – glass or apertured nexus veil not less than 20 mils thick. Outside finish shall be pigmented, paraffinated gel coat with an ultraviolet inhibitor. The inner surface shall be free of cracks and crazing with a smooth finish and with an average of not over two pits per square foot, providing the pits are less than 1/8-in diameter and not over 1/32 -in deep and are covered with sufficient resin to avoid exposure of inner surface fabric. Some waviness is permissible as long as the surface is smooth and free of pits.

4. Fittings and Joints: All fittings such as elbows, laterals, tees and reducers shall be of the same resin as an equal or superior in strength to the adjacent duct section and shall have the same internal dimensions as the adjacent duct. Non flanged duct joints shall be butt wrapped or bell and spigot joints. Bell and spigot joints shall be sealed with a standard butt joint overlay as per ASTM D3982. The interior opening between the bell and spigot shall be sealed with a resin paste so that no glass fibers are exposed, and all voids are filled. Field cut duct ends and exposed glass fibers shall be resin coated prior to joint assembly to maintain a continuous interior corrosion barrier. Coat all exterior surfaces of joints with a paraffinated resin rich gel coat with UV inhibitors. Joints: Butt-wrapped, bell and spigot, or flanged.
5. Total width of overlay butt-wrap joints shall be not less than 6-in for diameters from 6-in up to and including 30-in, 36-in and larger shall be not less than 10-in.
6. Round Fittings: Compression or spray-up/contact, molded of same material, pressure class, and joining method as duct
7. Thermoset FRP Resin: Manufacture duct with resin that complies with UL 181, Class 1, maximum flame-spread index of 25 and maximum smoke developed index of 50 when tested by NRTL according to ASTM E84
8. Inner Liner: FSK liner rated by an NRTL to comply with UL 181, Class1.

D. Fabrication:

1. Fabricate joints, seams, transitions, reinforcement, elbows, branch connections, and access doors and panels according to SMACNA's "Thermoset FRP Duct Construction Manual," Chapter 7, "Requirements."
2. Fabricate 90-degree round elbows:

    a. For duct 12 inches and smaller: a minimum of three segments and two prefabricated mitered joints
    b. For duct 14 inches and larger: a minimum of five segments and four prefabricated mitered joints Fabricate 45-degree round elbows with a minimum of two prefabricated mitered joints and three segments.

3. Fabricate 45-degree round elbows with a minimum of two prefabricated mitered joints and three segments.
4. Provide long-radius elbows unless otherwise noted.
5. Fabricate round elbows with a 1.5 radius-to-diameter ratio unless shown otherwise in the Drawings.
6. Fabricate duct elbows with integral stanchion and baseplate when necessary to support from the floor.
7. Fabricate ducts with a laminated ring, angle, or lug to support vertical sections.

8. There shall be not less than a 1/4 in buildup of FRP over the duct at each support and as shown on the Drawings.

E. Flanged Connections:

1. All connections to expansion joints, butterfly dampers, fire dampers, tanks, or other equipment shall be flanged. Gaskets shall be Viton with very good to excellent resistance to chemicals. Flanges shall be hand laid up to thickness specified ASTM 3982 except that minimum thickness shall be 3/4-in. Each flange face shall be ground flat, and a new 100 mil corrosion barrier shall be applied. The flange shall be anchored to a waxed table to ensure the flatness tolerance outlined above. The face shall be textured for use with full face Viton gaskets, 1/8-in minimum thickness. Flange drilling shall be as per ASTM D3982. All bolt holes shall be back spot faced for a washer seat. All flange bolts shall be torqued to values as recommended by manufacturer.
2. Hardware: Type 316 stainless steel.

F. FRP Transition Pieces:

1. Provide transition pieces as shown on drawings and specified herein.
2. Construction:

   a. Thickness of transition pieces shall be designed using a safety factor of 10 to 1 for pressure and 5 to 1 for vacuum service with the pressure classification listed below.
   b. Custom flanges shall be designed as required to connect to fans, coils, dampers and ductwork. Coordinate flange sizes to match approved equipment dimensions.

3. Pressure Classification: Manufacturer shall design transition pieces so that they shall be free from buckling, pulsing, warpage and sagging at design pressures.

G. Drains:

1. Provide drains in the main and branch ducts larger than 75 sq in in area for removal of condensate.
2. Predetermine locations of duct drains prior to manufacturer’s fabrication. Locate drains at each rise in duct or at the heel of drops to allow removal of condensate. Coordinate condensate collection with duct slope

H. Fabrication:

1. Fabricate joints, seams, transitions, reinforcement, elbows, branch connections, and access doors and panels according to SMACNA's "Thermoset FRP Duct Construction Manual," Chapter 7, "Requirements."

2.3 HANGERS AND SUPPORTS

A. General

1. Provide duct hanger and support material gauges to comply with details on the Drawings. Where details are not provided, support FRP ductwork using details and methods

described in the SMACNA Thermoset FRP Duct Construction Manual. Include a minimum live load of 50 percent volume filled with water for the design of supports for systems shown with fire protection installed, as shown on the Drawings. Protect the duct from clamping force of strap hangers with a 1/8-inch-thick layer of neoprene pad.

2. Suspend ductwork with threaded rod, flat bar, split rings, structural shapes, or strut material. The use of metal strap or wire as suspension material is prohibited.
3. In locations where hangers are exposed to corrosive atmosphere, provide stainless steel hanger materials and attaching hardware, with a suitable protective coating, thermoplastic shapes, or fiberglass strut.
4. In locations where hangers are not subjected to corrosive fumes, hanger materials and attaching hardware may be fabricated of mild plated or coated steel or similar structural material.
5. Externally bond anchors to the duct when required. Driving screws into, or other penetrations of the duct are not permitted.
6. Provide supports which are independent of equipment and walls.

B. Upper Attachments:

1. Concrete Construction

   a. Utilize cast-in-place inserts as specified in another division of work are acceptable if written approved by Owner.
   b. Utilize expanding concrete anchors as specified in another division of work may be used if written approved by Owner.
   c. The use of powder-actuated fasteners is prohibited without prior written consent by the Owner.

2. Steel Construction:

   a. Acceptable Manufacturers:

      1) Fee and Mason Manufacturing Company.
      2) Anvil (Grinnell).
      3) Cooper B Line.
      4) Or equal.

   b. Support ductwork from structure or supplementary steel, utilizing beam clamps designed for the intended service. Other support hardware is prohibited without prior written consent by the Owner. Support from metal decks above is prohibited. Provide supplementary steel as detailed and as required.

C. Support Frames: Provide structural steel shapes or strut frames for support of ductwork, accessories, and HVAC system components with nuts, bolts, fittings, etc., compatible with the frame material.

PART 3 - EXECUTION

3.1 DUCT INSTALLATION

A. General:

1. Install ducts with fewest possible joints.
2. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.
3. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
4. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.
5. Where ducts pass through fire-rated interior partitions and exterior walls, install fire dampers. Comply with requirements in Section 233300 "Air Duct Accessories" for fire and smoke dampers.
6. Protect duct interiors from the moisture, construction debris and dust, and other foreign materials. Comply with SMACNA's "IAQ Guidelines for Occupied Buildings Under Construction," Appendix G, "Duct Cleanliness for New Construction Guidelines."
7. Install fibrous-glass ducts and fittings to comply with SMACNA's "Fibrous Glass Duct Construction Standards."
8. Install thermoset FRP ducts and fittings to comply with SMACNA's "Thermoset FRP Duct Construction Manual."

B. Branch Takeoffs:

1. Provide takeoffs to equipment the same free area as the equipment outlet or the size shown, whichever is larger.
2. Position exhaust stream branches to avoid entry to the main at positions directly across from one another.
3. Tap branches into mains at an elevation that prevents condensation in the main from backflowing into the branch.

3.2 HANGER AND SUPPORT INSTALLATION

A. General Support Locations:

1. Locate hangers of ducts penetrating walls or partitions as though the walls will contribute no support to the duct.
2. Install hangers in pairs on exact opposite sides of duct. Install duct supports from floors and walls when necessary.
3. Install hangers at the midpoint of small- and medium-sized (less than 10 square feet) square elbows. On wide square elbows, install additional hangers at maximum allowable intervals (or less) measured along the heel lines of the elbows.
4. Provide a set of hangers at the midpoint of small- and medium-sized horizontal radius elbows with greater than 20-degree offset. Install one or more supplementary hangers along the inside and outside arcs of large-radius elbows of an angle when the length of these arcs exceeds the maximum hanger spacing length for that duct size.
5. Provide at least one set of hangers for short duct branches 3 feet or less in length.

6. Provide each duct riser with a minimum of two supports completely spanning the shaft opening at each floor. One pair of supports may be used to support more than one duct riser, provided that the strength of the supports is increased appropriately, and proper additional supplementary steel is used at the extra risers.
7. Support duct risers located between floors that are more than 15 feet high at each floor and halfway points between floors. The distance between intermediate supports on high floors should not exceed 12 feet for round ducts or 10 feet for rectangular ducts (intermediate hangers may be supported from an adjacent wall or hung by rods from supports on the floor above).

B. Specific Support Locations – Locate Duct Hangers:

1. Approximately 2 to 24 inches from flexible connections at fans.
2. Approximately 12 to 36 inches from the main duct to the first hanger of long branch ducts.
3. Approximately 2 inches to half the duct width, plus 2 inches from the vertical centerline of the lower elbow of short vertical offsets made with vaned square elbows. The width refers to the dimension of the elbow in the plane of the turn. The heavier the duct, the closer the hanger should be to the centerline of the elbow.
4. Approximately 2 inches to half the duct width, plus 2 inches from the vertical centerline of the bottom and top elbows of vaned square elbow offsets over 8 feet high. Increase the diameters of hanger rods of heavy offsets proportionately. The heavier the duct, the closer the hanger should be to the centerline of the elbow.
5. Approximately one-eighth of the arc in from the ends of bottom and top radius elbows of vertical offsets longer than 8 feet. Short vertical offsets require hangers at the bottom elbow. Sloping offsets need at least one set of hangers at their lower-radius elbow. Fasten hangers on sloping or arched surfaces to ducts to prevent slippage.
6. Approximately 6 to 12 inches from transverse joints of ducts whose lengths are the same as specified hanger intervals.
7. Approximately 6 to 12 inches from one side of walls or partitions penetrated by ducts.

C. Support Method:

1. Support low ductwork from floors or other steel structures acceptable to the Owner using struts or structural steel shapes or bars. Where possible, maintain 6 inches clear between the bottom of the duct and the supporting structure.
2. Support ductwork suspended from overhead structure using trapeze supports for rectangular ducts or straps for round ducts 10 inches in diameter and smaller with the hanger strap wound completely around the duct. Use rolled split angles as detailed on Drawing for round ducts 12 inches in diameter and larger. Use threaded rod for support from above.
3. Use of sheet metal screws for attaching support straps to ducts is prohibited.
4. Trim support material to minimum length after elevation is adjusted.
5. Provide supports at fittings and takeoffs as required to prevent stresses at joints.
6. Support ductwork from structural steel, supplementary steel, or concrete ribs. Submit the supporting methods from pre-cast concrete elements for review. Support from metal decks above is prohibited. Provide supplementary steel as required.

D. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

© 2026 CDM Smith
All Rights Reserved

3.3 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Leakage Tests:

1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
2. Test the entire duct system.
3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
4. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test entire system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure. Give seven days' advance notice for testing.

C. Duct System Cleanliness Tests:

1. Visually inspect duct system to ensure that no visible contaminants are present.

D. Duct system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.4 START UP

A. Air Balance: Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC."

3.5 DUCT SCHEDULE

A. Fabricate ducts to achieve SMACNA pressure class as indicated below:

1. Pressure Class: Positive 15-inch wg.
2. Pressure Class: Negative 15-inch wg.

B. Design ducts and thermal expansion system to accommodate 120 degrees F of ambient temperature range.

SECTION 233300 - AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Manual volume dampers.
2. Flange connectors.
3. Turning vanes.
4. Duct-mounted access doors.
5. Flexible connectors.

B. Related Requirements:

1. Section 233346 "Flexible Ducts" for insulated and non-insulated flexible ducts.
2. Section 233723 "HVAC Gravity Ventilators" for roof-mounted ventilator caps.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For duct accessories. Include plans, elevations, sections, details and attachments to other work.

1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances; and method of field assembly into duct systems and other construction. Include the following:

a. Special fittings.
b. Manual volume damper installations.
c. Control-damper installations.
d. Fire-damper, smoke-damper, combination fire- and smoke-damper, ceiling, and corridor damper installations, including sleeves; and duct-mounted access doors and remote damper operators.
e. Duct security bars.
f. Wiring Diagrams: For power, signal, and control wiring.

© 2026 CDM Smith
All Rights Reserved

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air duct accessories to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 MANUAL VOLUME DAMPERS

A. Standard, Aluminum, Manual Volume Dampers:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Greenheck.
b. McGill AirFlow LLC.
c. Pottorff.
d. Ruskin Company.

2. Standard leakage rating.
3. Suitable for horizontal or vertical applications.
4. Frames: Hat-shaped, 0.10-inch- thick, aluminum sheet channels; frames with flanges for attaching to walls and flangeless frames for installing in ducts.
5. Blades:

a. Multiple or single blade.
b. Parallel- or opposed-blade design.
c. Stiffen damper blades for stability.
d. Roll-Formed Aluminum Blades: 0.10-inch- thick aluminum sheet.
e. Extruded-Aluminum Blades: 0.050-inch- thick extruded aluminum.

6. Blade Axles: Stainless steel.
7. Bearings:

a. Stainless-steel sleeve.
b. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.

8. Tie Bars and Brackets: Aluminum.

B. Jackshaft:

1. Size: 0.5-inch diameter.
2. Material: Galvanized-steel pipe rotating within pipe-bearing assembly mounted on supports at each mullion and at each end of multiple-damper assemblies.
3. Length and Number of Mountings: As required to connect linkage of each damper in multiple-damper assembly.

C. Damper Hardware:

1. Zinc-plated, die-cast core with dial and handle made of 3/32-inch- thick zinc-plated steel, and a 3/4-inch hexagon locking nut.
2. Include center hole to suit damper operating-rod size.
3. Include elevated platform for insulated duct mounting.

2.2 DUCT SMOKE DETECTORS FOR UNCLASSIFIED AIR

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following or equal:

1. Air Products and Controls.
2. System Sensor.

B. Type: UL or CSA listed, photoelectric.

C. Housing: Refer to Materials of Construction Schedule.

D. Sampling Tube Material: Galvanized steel for galvanized steel ducts. Aluminum for aluminum ducts.

E. Operating Voltage: 115 VAC, 24 VAC, or 24 VDC.

F. Relay Contacts: Alarm condition, trouble condition, and equipment shutdown.

2.3 FLANGE CONNECTORS

A. Description: Add-on or roll-formed, factory-fabricated, slide-on transverse flange connectors, gaskets, and components.

B. Material: Galvanized steel.

C. Gauge and Shape: Match connecting ductwork.

2.4 TURNING VANES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Aero-Dyne Sound Control Co.
2. CL WARD & Family Inc.
3. Ductmate Industries, Inc.
4. Elgen Manufacturing

B. Manufactured Turning Vanes for Metal Ducts: Curved blades of galvanized sheet steel; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.

1. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.

C. Manufactured Turning Vanes for Nonmetal Ducts: Fabricate curved blades of resin-bonded fiberglass with acrylic polymer coating; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.

D. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 4-3, "Vanes and Vane Runners," and 4-4, "Vane Support in Elbows."

E. Vane Construction: Double wall.

F. Vane Construction: Single wall for ducts up to 48 inches wide and double wall for larger dimensions.

2.5 DUCT-MOUNTED ACCESS DOORS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. CL WARD & Family Inc.
2. Ductmate Industries, Inc.
3. Greenheck Fan Corporation.
4. Pottorff.
5. Ruskin.

B. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 7-2, "Duct Access Doors and Panels," and 7-3, "Access Doors - Round Duct."

1. Door:

    a. Double wall, rectangular.
    b. Galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class.
    c. Vision panel.
    d. Hinges and Latches: 1-by-1-inchbutt or piano hinge and cam latches.
    e. Fabricate doors airtight and suitable for duct pressure class.

2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
3. Number of Hinges and Locks:

    a. Access Doors Less Than 12 Inches Square: No hinges and two sash locks.
    b. Access Doors up to 18 Inches Square: Continuousand two sash locks.
    c. Access Doors up to 24 by 48 Inches: Continuousand two compression latches with outside and inside handles.
    d. Access Doors Larger Than 24 by 48 Inches: Continuousand two compression latches with outside and inside handles.

2.6 FLEXIBLE CONNECTORS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. CL WARD & Family Inc.
2. Ductmate Industries, Inc.
3. Duro Dyne Inc.
4. Ventfabrics, Inc.

B. Materials: Flame-retardant or noncombustible fabrics.

C. Coatings and Adhesives: Comply with UL 181, Class 1.

D. Metal-Edged Connectors: Factory fabricated with a fabric strip 3-1/2 inches wide attached to two strips of 2-3/4-inch- wide, 0.028-inch- thick, galvanized sheet steel or 0.032-inch- thick aluminum sheets. Provide metal compatible with connected ducts.

E. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.

1. Minimum Weight: 26 oz./sq. yd..
2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
3. Service Temperature: Minus 40 to plus 200 deg F.

F. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.

1. Minimum Weight: 24 oz./sq. yd..
2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling.
3. Service Temperature: Minus 50 to plus 250 deg F.

G. High-Temperature System, Flexible Connectors: Glass fabric coated with silicone rubber.

1. Minimum Weight: 16 oz./sq. yd..
2. Tensile Strength: 285 lbf/inch in the warp and 185 lbf/inch in the filling.
3. Service Temperature: Minus 67 to plus 500 deg F.

H. High-Corrosive-Environment System, Flexible Connectors: Glass fabric with chemical-resistant coating.

1. Minimum Weight: 14 oz./sq. yd..
2. Tensile Strength: 450 lbf/inch in the warp and 340 lbf/inch in the filling.
3. Service Temperature: Minus 67 to plus 500 deg F.

2.7 DUCT ACCESSORY HARDWARE

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.

B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Install backdraft dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.

D. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.

1. Install steel volume dampers in steel ducts.
2. Install aluminum volume dampers in aluminum ducts.

E. Set dampers to fully open position before testing, adjusting, and balancing.

F. Install test holes at fan inlets and outlets and elsewhere as indicated.

G. Access Door Sizes:

1. One-Hand or Inspection Access: 8 by 5 inches.
2. Two-Hand Access: 12 by 6 inches.
3. Head and Hand Access: 18 by 10 inches.
4. Head and Shoulders Access: 21 by 14 inches.
5. Body Access: 25 by 14 inches.
6. Body plus Ladder Access: 25 by 17 inches.

H. Label access doors according to Section 230553 "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.

I. Install flexible connectors to connect ducts to equipment.

J. For fans developing static pressures of 5-inch wg and more, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

K. Install duct test holes where required for testing and balancing purposes.

© 2026 CDM Smith
All Rights Reserved

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Operate dampers to verify full range of movement.
2. Inspect locations of access doors and verify that purpose of access door can be performed.
3. Inspect turning vanes for proper and secure installation.

END OF SECTION 233300

SECTION 233416 - CENTRIFUGAL HVAC FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Utility set fans.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes for fans.
2. Rated capacities, operating characteristics, and furnished specialties, and accessories.
3. Certified fan performance curves with system operating conditions indicated.
4. Certified fan sound-power ratings.
5. Motor ratings and electrical characteristics, plus motor and electrical accessories.
6. Material thickness and finishes, including color charts.
7. Dampers, including housings, linkages, and operators.

B. Shop Drawings:

1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.
4. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
5. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include adjustable motor basis, rails, and frames for equipment mounting.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

© 2026 CDM Smith
All Rights Reserved

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For centrifugal fans to include in normal operation, emergency, operation, and maintenance manuals with replacement parts listing.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Belts: One set(s) for each belt-driven unit.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. AMCA Compliance:

1. Comply with AMCA performance requirements and bear the AMCA-Certified Ratings Seal.

2.2 UTILITY SET FANS - SUPPLY

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Greenheck.
2. Loren Cook Company.
3. New York Blower Company (The).
4. Twin City Blower.

B. Description:

1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fan utility vent sets, consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.

C. Housings:

1. Housing Material: Reinforced steel.
2. Housing Coating: Industrial grade alkyd enamel.
3. Formed panels to make curved-scroll housings with shaped cutoff.
4. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
5. Discharge Arrangement: Fan scroll housing field rotatable to any of seven discharge positions. Provide fan with discharge positioned in proper direction to minimize connected duct turns.

D. Wheels:

1. Wheel Configuration: DWDI, with hub keyed to shaft.
2. Wheel and Blade Materials: Steel.
3. Backward-Inclined Airfoil Blades:

    a. Aerodynamic design.
    b. Heavy backplate.
    c. Hollow die-formed, airfoil-shaped blades continuously welded at tip flange and backplate.

E. Shafts:

1. Turned, ground, and polished steel; keyed to wheel hub. First critical speed at least 1.25 times maximum class speed.

F. Bearings:

1. Heavy-duty regreasable ball or roller type in a cast iron pillowblock housing.
2. Roller-Bearing Rating Life: ABMA 11, L(10) of 250,000 hours.
3. Extend grease fitting to accessible location outside of unit.

G. Belt Drive:

1. Factory mounted, with final alignment and belt adjustment made after installation.
2. Service Factor Based on Fan Motor Size: 1.5.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with motors larger than 5 hp. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Comply with OSHA and fabricate according to SMACNA's "HVAC Duct Construction Standards," 0.146 inch- thick, 3/4-inch diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short-circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.

H. Motor Enclosure: Totally enclosed, fan cooled.

I. Accessories:

1. Outlet: Flanged.
2. Backdraft Dampers: Gravity actuated with counterweight and interlocking aluminum blades, with felt edges in steel frame installed on fan discharge.
3. Access Door: Gasketed door in scroll with latch-type handles.
4. Inlet Screens: Removable wire mesh.
5. Belt Guard: OSHA-compliant, completely enclosed shaft and drive components.

© 2026 CDM Smith
All Rights Reserved

2.3 UTILITY SET FANS - EXHAUST

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Greenheck.
2. Loren Cook Company.
3. New York Blower Company (The).
4. Twin City Blower.

B. Description:

1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fan utility vent sets, consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.

C. Housings:

1. Housing Material: Reinforced steel.
2. Housing Coating: Industrial grade alkyd enamel.
3. Formed panels to make curved-scroll housings with shaped cutoff.
4. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
5. Discharge Arrangement: Fan scroll housing field rotatable to any of seven discharge positions. Provide fan with discharge positioned in proper direction to minimize connected duct turns.

D. Wheels:

1. Wheel Configuration: SWSI, with hub keyed to shaft.
2. Wheel and Blade Materials: Steel.
3. Backward-Inclined Airfoil Blades:

    a. Aerodynamic design.
    b. Heavy backplate.
    c. Hollow die-formed, airfoil-shaped blades continuously welded at tip flange and backplate.

E. Shafts:

1. Turned, ground, and polished steel; keyed to wheel hub. First critical speed at least 1.4 times maximum class speed.

F. Bearings:

1. Heavy-duty regreasable ball or roller type in a cast iron pillowblock housing.
2. Ball-Bearing Rating Life: ABMA 9, L(50) of 200,000 hours.
3. Roller-Bearing Rating Life: ABMA 11, L(50) of 200,000 hours.
4. Extend grease fitting to accessible location outside of unit.

G. Belt Drive:

1. Factory mounted, with final alignment and belt adjustment made after installation.
2. Service Factor Based on Fan Motor Size: 1.5.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with motors larger than 5 hp. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Comply with OSHA and fabricate according to SMACNA's "HVAC Duct Construction Standards," 0.146 inch- thick, 3/4-inch diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short-circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.

H. Motor Enclosure: Totally enclosed, fan cooled.

I. Accessories:

1. Inlet and Outlet: Flanged.
2. Backdraft Dampers: Gravity actuated with counterweight and interlocking aluminum blades, with felt edges in steel frame installed on fan discharge.
3. Access Door: Gasketed door in scroll with latch-type handles.
4. Inlet Screens: Removable wire mesh.
5. Belt Guard: OSHA-compliant, completely enclosed shaft and drive components.

2.4 MOTORS

A. Where variable-frequency drives are indicated or scheduled, provide fan motor compatible with variable-frequency drive.

2.5 SOURCE QUALITY CONTROL

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

B. AMCA Compliance: Fans shall comply with AMCA 11 and bear the AMCA-Certified Ratings Seal.

C. Fan Sound Ratings: Comply with AMCA 311 and label fans with the AMCA-Certified Ratings Seal. Sound ratings shall comply with AMCA 301. The fans shall be tested according to AMCA 300.

D. Fan Performance Ratings: Comply with AMCA 211 and label fans with AMCA-Certified Rating Seal. The fans shall be tested for air performance - flow rate, fan pressure, power, fan efficiency, air density, speed of rotation, and fan efficiency - according to AMCA 210/ASHRAE 51.

E. Operating Limits: Classify fans according to AMCA 99.

All Rights Reserved

PART 3 - EXECUTION

3.1 INSTALLATION OF CENTRIFUGAL HVAC FANS

A. Install centrifugal fans level and plumb.

B. Disassemble and reassemble units, as required for moving to the final location, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

D. Equipment Mounting:

1. Install floor-mounted centrifugal fans on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
2. Comply with requirements for vibration isolation devices specified in Section 230548.13 "Vibration Controls for HVAC."

E. Install units with clearances for service and maintenance.

F. Label fans according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

3.2 DUCTWORK AND PIPING CONNECTIONS

A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 233300 "Air Duct Accessories."

B. Install ducts adjacent to fans to allow service and maintenance.

3.3 ELECTRICAL CONNECTIONS

A. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

B. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

C. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.

1. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.

3.4 CONTROL CONNECTIONS

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring according to Section 260523 "Control-Voltage Electrical Power Cables."

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections with the assistance of a factory-authorized service representative.

C. Tests and Inspections:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that there is adequate maintenance and access space.
4. Verify that cleaning and adjusting are complete.
5. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
6. Adjust belt tension.
7. Adjust damper linkages for proper damper operation.
8. Verify lubrication for bearings and other moving parts.
9. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
10. See Section 230593 "Testing, Adjusting, and Balancing For HVAC" for testing, adjusting, and balancing procedures.
11. Remove and replace malfunctioning units and retest as specified above.

D. Test and adjust controls and safeties. Controls and equipment will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.6 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing procedures.

D. Replace fan and motor pulleys as required to achieve design airflow.

© 2026 CDM Smith
All Rights Reserved

E. Lubricate bearings.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain centrifugal fans.

END OF SECTION 233416

All Rights Reserved

SECTION 233423 - HVAC POWER VENTILATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Centrifugal ventilators - roof upblast and sidewall.
2. Delegated design.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes for fans.
2. Rated capacities, operating characteristics, and furnished specialties and accessories.
3. Certified fan performance curves with system operating conditions indicated.
4. Certified fan sound-power ratings.
5. Motor ratings and electrical characteristics, plus motor and electrical accessories.
6. Material thickness and finishes, including color charts.
7. Dampers, including housings, linkages, and operators.
8. Prefabricated roof curbs.
9. Fan speed controllers.

B. Shop Drawings:

1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.
4. Design Calculations: Calculate requirements for selecting vibration isolators.

1.4 DELEGATED DESIGN SUBMITTALS

A. For unit hangers and supports indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Design Calculations: Calculate requirements for selecting vibration isolators and for designing vibration isolation bases.

B. Qualifications Statement: Submit qualifications for licensed professional.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, reflected ceiling plans, and other details, or BIM model, drawn to scale, showing the items described in this Section and coordinated with all building trades.

B. Seismic Qualification Data: For fans, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For HVAC power ventilators to include in normal and emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Belts: One set(s) for each belt-driven unit.

1.8 QUALITY ASSURANCE

A. Delegated Design Engineer: Licensed professional engineer experienced in design of specified Work and licensed in the jurisdiction of the project location.

PART 2 - PRODUCTS

2.1 CENTRIFUGAL VENTILATORS - ROOF UPBLAST OR SIDEWALL

A. Configuration: Centrifugal roof upblast ventilator.

B. Housing: Removable spun-aluminum dome top and outlet baffle; square, one-piece aluminum base with venturi inlet cone.

1. Upblast Units: Provide spun-aluminum discharge baffle to direct discharge air upward, with rain and snow drains.

C. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.

D. Belt Drives:

1. Resiliently mounted to housing.
2. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
3. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings; minimum ABMA9, L(10) of 100,000 hours.
4. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
5. Motor Pulleys: Adjustable pitch for use with motors through 5 hp. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions. Provide fixed pitch for use with motors larger than 5 hp.
6. Fan and motor isolated from exhaust airstream.

E. Accessories:

1. Variable-Frequency Motor Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
2. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
3. Bird Screens: Removable, 1/2-inch mesh, aluminum or brass wire.
4. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
5. Motorized Dampers: Parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.
6. Spark-resistant, all-aluminum wheel construction.
7. Mounting Pedestal: Galvanized steel with removable access panel.
8. Wall Mount Adapter: Attach wall-mounted fan to wall.
9. Restaurant Kitchen Exhaust: UL 762 listed for grease-laden air exhaust.

F. Prefabricated Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch- thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.

1. Configuration: Self-flashing without a cant strip, with mounting flange.

2.2 SOURCE QUALITY CONTROL

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

B. AMCA Certification: Fans shall comply with AMCA 11 and bear the AMCA-Certified Ratings Seal.

C. Fan Sound Ratings: Comply with AMCA 311, and label fans with the AMCA-Certified Ratings Seal. Sound ratings shall comply with AMCA 301. The fans shall be tested according to AMCA 300.

D. Fan Performance Ratings: Comply with AMCA 211 and label fans with AMCA-Certified Rating Seal. The fans shall be tested for air performance - flow rate, fan pressure, power, fan efficiency, air density, speed of rotation, and fan efficiency - according to AMCA 210/ASHRAE 51.

E. Operating Limits: Classify according to AMCA 99.

F. UL Standards: Power ventilators shall comply with UL 705. Power ventilators for use for restaurant kitchen exhaust shall also comply with UL 762.

PART 3 - EXECUTION

3.1 INSTALLATION OF HVAC POWER VENTILATORS

A. Install power ventilators level and plumb.

B. Equipment Mounting:

1. Install power ventilators on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
2. Comply with requirements for vibration isolation devices specified in Section 230548.13 "Vibration Controls for HVAC."

C. Secure roof-mounted fans to roof curbs with zinc-plated hardware. See Section 077200 "Roof Accessories" for installation of roof curbs.

D. Install units with clearances for service and maintenance.

E. Label units according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

3.2 DUCTWORK CONNECTIONS

A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 233300 "Air Duct Accessories."

3.3 ELECTRICAL CONNECTIONS

A. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

B. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

C. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.

1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 260553 "Identification for Electrical Systems."
2. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.

3.4 CONTROL CONNECTIONS

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring according to Section 260523 "Control-Voltage Electrical Power Cables."

3.5 FIELD QUALITY CONTROL

A. Perform tests and inspections with the assistance of a factory-authorized service representative.

B. Tests and Inspections:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that there is adequate maintenance and access space.
4. Verify that cleaning and adjusting are complete.
5. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
6. Adjust belt tension.
7. Adjust damper linkages for proper damper operation.
8. Verify lubrication for bearings and other moving parts.
9. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
10. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
11. Shut unit down and reconnect automatic temperature-control operators.
12. Remove and replace malfunctioning units and retest as specified above.

C. Test and adjust controls and safeties. Controls and equipment will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.6 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing procedures.

D. Replace fan and motor pulleys as required to achieve design airflow.

E. Lubricate bearings.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain centrifugal fans.

SECTION 233713.23 - REGISTERS AND GRILLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Adjustable blade face registers.

B. Related Requirements:

1. Section 233300 "Air Duct Accessories" for fire and smoke dampers and volume-control dampers not integral to registers and grilles.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
2. Register and Grille Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

1.4 INFORMATIONAL SUBMITTALS

A. Source quality-control reports.

PART 2 - PRODUCTS

2.1 REGISTERS

A. Adjustable Blade Face Register SR:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Titus; brand of Johnson Controls International plc, Global Products; 272 or a comparable product by one of the following:

a. Carnes Company.

b. METALAIRE, Inc.
c. Price Industries Limited.

2. Material: Aluminum.
3. Finish: Baked enamel, white.
4. Face Blade Arrangement: Vertical spaced 3/4 inch apart.
5. Rear-Blade Arrangement: Horizontal spaced 3/4 inch apart.
6. Frame: 1-1/4 inches wide.
7. Mounting: Countersunk screw.
8. Damper Type: Adjustable opposed blade.

2.2 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate registers and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas where registers and grilles are installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install registers and grilles level and plumb.

B. Outlets and Inlets Locations: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Engineer for a determination of final location.

C. Install registers and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.3 ADJUSTING

A. After installation, adjust registers and grilles to air patterns indicated, or as directed, before starting air balancing.

SECTION 233723 - HVAC GRAVITY VENTILATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Hooded ventilators.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. For louvered-penthouse ventilators specified to bear AMCA seal, include printed catalog pages, showing specified models with appropriate AMCA Certified Ratings Seals.

B. Shop Drawings: For gravity ventilators.

1. Include plans, elevations, sections, details, ventilator attachments to curbs, and curb attachments to roof structure.
2. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.

1.4 COORDINATION

A. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Structural Performance: Ventilators shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of ventilator components, noise or metal fatigue caused by ventilator blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.

1. Wind Loads: Determine loads based on pressures as indicated on Drawings.

2. Wind Loads: Determine loads based on a uniform pressure of 40 lbf/sq. ft., acting inward or outward.
3. Snow Load: Unit to withstand a minimum of 20- lbf/sq. ft.snow load.

B. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1.

C. ASHRAE 62.1 Compliance: Section 5, "Systems and Equipment" and Section 7, "Construction and System Start-up."

2.2 FABRICATION

A. Factory or shop fabricate gravity ventilators to minimize field splicing and assembly. Disassemble units to the minimum extent as necessary for shipping and handling. Clearly mark units for reassembly and coordinated installation.

B. Fabricate frames, including integral bases, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

C. Fabricate units with closely fitted joints and exposed connections accurately located and secured.

D. Fabricate supports, anchorages, and accessories required for complete assembly.

E. Perform shop welding by AWS-certified procedures and personnel.

2.3 HOODED VENTILATORS

A. Description: Hooded rectangular penthouse for intake air.

B. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Greenheck Fan Corporation.
2. Loren Cook Company.
3. Twin City Fan & Blower.

C. Source Limitations: Obtain hooded ventilators from single manufacturer.

D. Construction:

1. Material: Galvanized steel, of thickness required to comply with structural performance requirements, but not less than 0.064-inch- thick base and 0.040-inch- thick hood; suitably reinforced.
2. Material: Aluminum, of thickness required to comply with structural performance requirements, but not less than 0.063-inch- thick base and 0.050-inch- thick hood; suitably reinforced.
3. Insulation: None.
4. Bird Screening: Galvanized-steel, 1/2-inch- square mesh wire.

E. Galvanized-Steel Finish:

1. Surface Preparation: Clean surfaces of dirt, grease, and other contaminants. Clean welds, mechanical connections, and abraded areas, and repair galvanizing according to ASTM A780/A780M. Apply a conversion coating suited to the organic coating to be applied over it.
2. Factory Priming for Field-Painted Finish: Where field painting after installation is indicated, apply an air-dried primer immediately after cleaning and pretreating.
3. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard finish consisting of prime coat and thermosetting topcoat, with a minimum dry film thickness of 1 mil for topcoat and an overall minimum dry film thickness of 2 mils.

    a. Color and Gloss: As indicated by manufacturer's designations.

F. Dampers:

1. Location: Curb damper tray.
2. Control: Motorized.
3. Tray: Provide damper tray or shelf with opening 3 inches less than interior curb dimensions indicated.

G. Roof Curbs: Galvanized-steel sheet; with mitered and welded corners; 1-1/2-inch- thick, rigid fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to fit roof opening and ventilator base.

1. Configuration: Self-flashing without a cant strip, with mounting flange.
2. Overall Height: 12 inches.

2.4 MATERIALS

A. Aluminum Extrusions: ASTM B221, Alloy 6063-T5 or T-52.

B. Aluminum Sheet: ASTM B209, Alloy 3003 or 5005, with temper as required for forming or as otherwise recommended by metal producer for required finish.

C. Galvanized-Steel Sheet: ASTM A653/A653M, G90 zinc coating, mill phosphatized.

D. Stainless Steel Sheet: ASTM A666, Type 304, with No. 4 finish.

E. Fasteners: Same basic metal and alloy as fastened metal or 300 Series stainless steel unless otherwise indicated. Do not use metals that are incompatible with joined materials.

1. Use types and sizes to suit unit installation conditions.
2. Use hex-head or Phillips pan-head screws for exposed fasteners unless otherwise indicated.

F. Post-Installed Fasteners for Concrete and Masonry: Torque-controlled expansion anchors made from stainless-steel components, with capability to sustain without failure a load equal to 4 times the loads imposed for concrete, or 6 times the load imposed for masonry, as determined

by testing according to ASTM E488/E488M, conducted by a qualified independent testing agency.

G. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187/D1187M.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install gravity ventilators level, plumb, and at indicated alignment with adjacent work.

B. Secure gravity ventilators to roof curbs with zinc-plated hardware, that comply with the wind and seismic fastening requirements. Use concealed anchorages where possible. Refer to Section 077200 "Roof Accessories."

C. Install gravity ventilators with clearances for service and maintenance.

D. Install perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Install concealed gaskets, flashings, joint fillers, and insulation as installation progresses. Comply with Section 079200 "Joint Sealants" for sealants applied during installation.

F. Label gravity ventilators according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

G. Protect galvanized and nonferrous-metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.

H. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes, so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

I. Refer to Section 077200 "Roof Accessories" for flashing and counterflashing of roof curbs.

3.2 CONNECTIONS

A. Duct installation and connection requirements are specified in Section 233113 "Metal Ducts" and Section 233116 "Nonmetal Ducts." Drawings indicate general arrangement of ducts and duct accessories.

3.3 ADJUSTING

A. Adjust damper linkages for proper damper operation.

END OF SECTION 233723

© 2026 CDM Smith

SECTION 235700 - HEAT EXCHANGERS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes gasketed-plate heat exchangers.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include rated capacities, operating characteristics, and furnished specialties and accessories.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Equipment room plan or BIM model, drawn to scale, showing the items described in this Section, and coordinated with all building trades.

B. Source quality-control reports.

C. Field quality-control reports.

D. Sample Warranty: For manufacturer's warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For heat exchangers to include in emergency, operation, and maintenance manuals.

© 2026 CDM Smith
All Rights Reserved

1.6 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of heat exchangers that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures, including heat exchanger, storage tank, and supports.
b. Faulty operation of controls.
c. Deterioration of metals, metal finishes, and other materials beyond normal use.

2. Warranty Periods: From date of Substantial Completion.

a. Plate Heat Exchangers:

1) Gasketed-Plate Type: One year(s).

PART 2 - PRODUCTS

2.1 GASKETED-PLATE HEAT EXCHANGERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Alfa Laval Inc.
2. Armstrong Fluid Technology.
3. Bell & Gossett; a Xylem brand.

B. Configuration: Freestanding assembly consisting of frame support, top and bottom carrying and guide bars, fixed and movable end plates, tie rods, individually removable plates, and one-piece gaskets. Floor-mounted heat exchangers must have integral legs with mounting feet.

C. Construction: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1.

D. Frame:

1. Capacity to accommodate 20 percent additional plates.
2. Painted carbon steel with provisions for anchoring to support.

E. Top and Bottom Carrying and Guide Bars: Painted carbon steel, aluminum, or stainless steel.

1. Fabricate attachment of heat-exchanger support bars and guide bars with reinforcement strong enough to resist heat-exchanger movement during seismic event when heat-exchanger support bars and guide bars are anchored to building structure.

F. End-Plate Material: Painted carbon steel.

G. Tie Rods and Nuts: Steel or stainless steel.

H. Plate Material: 0.031 inch thick before stamping; Type 304 stainless steel.

I. Gasket Materials: EPDM rubber.

J. Piping Connections: Factory fabricated of materials compatible with heat-exchanger shell. Attach tappings to shell before testing and labeling.

1. NPS 2 and Smaller: Threaded ends in accordance with ASME B1.20.1.
2. NPS 2-1/2 and Larger: Flanged ends in accordance with ASME B16.5 for steel and stainless steel flanges and in accordance with ASME B16.24 for copper and copper-alloy flanges.

K. Enclose plates in solid stainless steel removable shroud.

2.2 ACCESSORIES

A. Hangers and Supports:

1. Custom-built steel supports and saddles for mounting on floor.
2. Supports and saddles to ensure both horizontal and vertical support of heat exchanger. Comply with requirements in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."

B. Shroud: Stainless steel sheet.

C. Miscellaneous Components for Hot-Water Unit: Control valve, valves, thermometers, and piping. Include components fitted for electric control.

D. Pressure-Relief Valves: Bronze,, ASME rated and stamped.

1. Pressure-relief valve setting: 50 psig.

2.3 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect heat exchangers in accordance with ASME Boiler and Pressure Vessel Code, Section VIII, "Pressure Vessels," Division 1. Affix ASME International label.

B. Hydrostatically test heat exchangers to minimum of one and one-half times pressure rating before shipment.

C. Heat exchangers will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas for compliance with requirements for installation tolerances and for structural rigidity, strength, anchors, and other conditions affecting performance of heat exchangers.

B. Examine roughing-in for heat-exchanger piping to verify actual locations of piping connections before equipment installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF HEAT-EXCHANGER, GENERAL

A. Equipment Mounting:

1. Install floor-mounted heat exchangers on cast-in-place concrete equipment bases. Install all heat exchangers level and plumb in accordance with manufacturer's recommendations. Install floor-mounted and wall-hung steam heat exchangers at sufficient height, using sufficient length supports, to achieve required steam and condensate pipe pitch. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
2. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

3.3 INSTALLATION OF GASKETED-PLATE HEAT EXCHANGER

A. Install wall-mounted gasketed-plate heat exchanger on custom-designed wall supports anchored to structure as indicated on Drawings.

B. Install floor-mounted gasketed-plate heat exchangers on cast-in-place concrete equipment base and fasten legs to base.

C. Install metal shroud over installed gasketed-plate heat exchanger in accordance with manufacturer's written instructions.

3.4 PIPING CONNECTIONS

A. Comply with requirements for piping specified in Section 232113 "Hydronic Piping" and Section 232116 "Hydronic Piping Specialties." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Comply with requirements for steam and condensate piping specified in Section 232213 "Steam and Condensate Heating Piping" and Section 232216 "Steam and Condensate Heating Piping Specialties."

C. Maintain manufacturer's recommended clearances for tube removal, service, and maintenance.

D. Install piping adjacent to heat exchangers to allow space for service and maintenance of heat exchangers. Arrange piping for easy removal of heat exchangers.

E. Install shutoff valves at heat-exchanger inlet and outlet connections.

F. Install pressure-relief valves on heat-exchanger shells where a connection has been provided on shell. When no shell pressure-relief valve connection has been provided, install pressure-relief valve on shell outlet piping before any isolation valves.

G. Install pressure-relief valves on heat-exchanger tube outlet piping before any isolation valves.

H. Pipe pressure-relief valves, full size of valve connection, to floor drain.

I. Install vacuum breaker at heat-exchanger steam inlet connection.

J. Install hose end valve to drain shell.

K. Install thermometer on each heat-exchanger fluid inlet and outlet piping. Comply with requirements for thermometers specified in Section 230519 "Meters and Gauges for HVAC Piping."

L. Install pressure gauges on each heat-exchanger fluid inlet and outlet piping. Comply with requirements for pressure gauges specified in Section 230519 "Meters and Gauges for HVAC Piping."

3.5 CLEANING

A. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris, and repair damaged finishes.

B. Isolate heat exchangers from piping before flushing piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blind flanges in flanged joints to isolate equipment.

C. Flush heat-exchanger piping systems with clean water; then remove and clean or replace strainer screens before reopening flow to heat exchangers.

3.6 FIELD QUALITY CONTROL

A. Testing Agency, Owner: Owner will engage a qualified testing agency to perform tests and inspections.

B. Testing Agency, Contractor: Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Perform tests and inspections:

E. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

F. Heat exchanger will be considered defective if it does not pass tests and inspections.

G. Prepare test and inspection reports.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain heat exchangers.

SECTION 237343.16 - OUTDOOR, SEMI-CUSTOM AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes outdoor, semi-custom air-handling units that are factory assembled using multiple section components; including:

1. Unit casings.
2. Fan, drive, and motor section.
3. Coil section.
4. Air filtration section.
5. Dampers.
6. Roof curbs.
7. Intake and relief air openings.

B. Related Requirements:

1. Section 230593 "Testing, Adjusting, and Balancing for HVAC."
2. Section 230716 "HVAC Equipment Insulation."
3. Section 230923 "Direct Digital Control (DDC) System for HVAC."
4. Section 233113 "Metal Ducts."
5. Section 233300 "Air Duct Accessories."

1.3 ACTION SUBMITTALS

A. Product Data: For each air-handling unit.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
3. Include unit dimensions and weight.
4. Include cabinet material, metal thickness, finishes, insulation, and accessories.
5. Fans:

    a. Include certified fan-performance curves with system operating conditions indicated.
    b. Include certified fan-sound power ratings.
    c. Include fan construction and accessories.
    d. Include motor ratings, electrical characteristics, and motor accessories.

6. Include certified coil-performance ratings with system operating conditions indicated.
7. Include certified coil-performance ratings with system operating conditions indicated.
8. Include dampers, including housings, linkages, and operators.

A. Shop Drawings: For each outdoor, semi-custom air-handling unit.

1. Include plans, elevations, sections, and mounting details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Detail fabrication and assembly of outdoor, semi-custom air-handling units, as well as procedure and diagrams.
4. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans and other details, or BIM model, drawn to scale, showing the items described in this Section, and coordinated with all building trades.

B. Sample Warranty: For manufacturer's warranty.

C. Product Certificates: Submit certification that specified equipment will withstand wind forces identified in "Performance Requirements" Article and in Section 230548 "Vibration and Seismic Controls for HVAC."

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of wind force and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Source quality-control reports.

E. Startup service reports.

F. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air-handling units to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: One set(s) for each air-handling unit.

2. Gaskets: One set(s) for each access door.
3. Fan Belts: One set(s) for each air-handling unit fan.

1.7 WARRANTY

A. Warranty: Manufacturer agrees to repair or replace components of outdoor, semi-custom, air-handling unit that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Entire Unit: Manufacturer's standard but not less than one year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.

C. ASHRAE 62.1 Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

D. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design vibration isolation, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

E. Structural Performance:

1. Casing Panels: Self-supporting and capable of withstanding positive/negative 8-inch wg internal static pressure, without exceeding a midpoint deflection of 0.0042 inch/inch of panel span.
2. Floor and Roof Panels: Self-supporting and capable of withstanding 300-lb static load at midspan, without exceeding a midpoint deflection of 0.0042 inch/inch.
3. Roof Panels: Self-supporting and capable of withstanding a static snow load of 30 lb/sq. ft., without exceeding a midpoint deflection of 0.0042 inch/inch.

F. Casing Leakage Performance: ASHRAE 111, Class 6 leakage or better at plus or minus 8-inch wg.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Carrier Global Corporation.

2. Trane.
3. YORK; brand of Johnson Controls International plc, Building Solutions North America.

B. Source Limitations: Obtain from single source from single manufacturer.

2.3 UNIT CASINGS

A. Frame: Modular and providing overall structural integrity without reliance on casing panels for structural support.

B. Base Rail:

1. Material: Welded structural steel.
2. Height: 6 inches.

C. Casing Joints: Hermetically sealed at each corner and around entire perimeter.

D. Double-Wall Construction:

1. Outside Casing Wall:

a. Material, Stainless Steel: Minimum 18 gauge thick.
b. Factory Finish: Provide manufacturer's standard finish.

2. Inside Casing Wall:

a. Material, Stainless Steel: Solid, minimum 18 gauge thick.

E. Floor Plate:
1. Material: Stainless steel, minimum 12 gauge thick.

F. Roof: Cross-broken and pitched with "C" caps over joints to provide watertight seal.

G. Piping Vestibule: Insulated with same insulation and thickness as casing, 30 inches deep by full width of piping connections.

H. Casing Insulation:

1. Materials: injected polyurethane foam insulation.
2. Casing Panel R-Value: Minimum R-11.
3. Insulation Thickness: 2 inches.
4. Thermal Break: Provide continuity of insulation with no through-casing metal in casing walls, floors, or roofs of air-handling unit.

I. Static-Pressure Classifications:

1. For Unit Sections Upstream of Fans: Minus 6-inch wg.
2. For Unit Sections Downstream and Including Fans: 6-inch wg.

J. Panels, Doors, and Windows:

1. Panels:

    a. Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing.
    b. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against airflow
    c. Gasket: Neoprene, applied around entire perimeters of panel frames.
    d. Size: Large enough to allow unobstructed access for inspection and maintenance of air-handling unit's internal components. At least 18 inches wide by full height of unit casing up to a maximum height of 72 inches.

2. Doors:

    a. Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing.
    b. Hinges: A minimum of two ball-bearing hinges or stainless-steel piano hinge and two wedge-lever latches, operable from inside and outside. Arrange doors to be opened against airflow. Provide safety latch retainers on doors so that doors do not open uncontrollably.
    c. Gasket: Neoprene, applied around entire perimeters of panel frames.
    d. Size: Large enough to allow for unobstructed access for inspection and maintenance of air-handling unit's internal components. At least 18 inches wide by full height of unit casing up to a maximum height of 72 inches.

3. Locations and Applications:

    a. Fan Section: Doors.
    b. Coil Section: Panels.
    c. Access Section: Doors.
    d. Access Sections Immediately Upstream and Downstream of Coil Sections: Doors.
    e. Damper Section: Doors.
    f. Filter Section: Doors large enough to allow periodic removal and installation of filters.
    g. Access Sections Immediately Downstream of Filter Sections: Doors.
    h. Mixing Section: Doors.

4. Convenience Outlets: One 20-A duplex GFCI receptacle per location with junction box located on outside casing wall.

    a. Locations: Fan section.

2.4 FAN, DRIVE, AND MOTOR SECTION

A. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower.

B. Fans: Centrifugal, rated according to AMCA 210; galvanized steel; mounted on solid-steel shaft.

1. Shafts: With field-adjustable alignment.

a. Turned, ground, and polished hot-rolled steel with keyway.

2. Shaft Bearings:

a. Grease-Lubricated, Tapered-Roller Bearings: Self-aligning, pillow-block type with double-locking collars and two-piece, cast-iron housing with grease lines extended to outside unit and an L-50 rated life of 200,000 hours according to ABMA 11.

3. Housings: Formed- and reinforced-steel panels to form curved scroll housings with shaped cutoff and spun-metal inlet bell.

a. Bracing: Steel angle or channel supports for mounting and supporting fan scroll, wheel, motor, and accessories.

4. Housings, Plenum Fans: Steel frame and panel; fabricated without fan scroll and volute housing. Provide inlet screens for Type SWSI fans.
5. Plenum Fan Arrays: Contained as defined in AHRI 430. Steel or aluminum frame with inlet cone and structural framing around each fan built into an array of multiple fans. Provide backdraft dampers at each fan to prevent short circuiting of flow if one fan is not operating.
6. Mounting: For internal vibration isolation. Factory-mount fans with manufacturer's standard vibration isolation mounting devices having a minimum static deflection of 2 inches.
7. Shaft Lubrication Lines: Extended to a location outside the casing.
8. Flexible Connector: Factory fabricated with a fabric strip minimum 3-1/2 inches wide, attached to two strips of minimum 2-3/4-inch-wide by 0.028-inch-thick, galvanized-steel sheet.

a. Flexible Connector Fabric: Glass fabric, double coated with neoprene. Fabrics, coatings, and adhesives shall comply with UL 181, Class 1.

1) Fabric Minimum Weight: 26 oz./sq. yd..
2) Fabric Minimum Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
3) Fabric Minimum Service Temperature Range: Minus 40 to plus 200 deg F.

C. Drive, Direct: Factory-mounted, direct drive.

D. Motors:

1. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
3. Efficiency: Premium efficient as defined in NEMA MG 1.
4. Motor Pulleys: Adjustable pitch for use with 5-hp motors and smaller; fixed pitch for use with motors larger than 5 hp. Select pulley size, so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.

6. Mount unit-mounted disconnect switches on exterior of unit.

E. Variable-Frequency Motor Controller: Serving all fans combined in fan array.

1. Manufactured Units: Pulse-width modulated; constant torque and variable torque for inverter-duty motors.
2. Output Rating: Three phase; 10 to 60 Hz, with voltage proportional to frequency throughout voltage range; maximum voltage equals input voltage.
3. Unit Operating Requirements:

a. Internal Adjustability:

1) Minimum Speed: 5 to 25 percent of maximum rpm.
2) Maximum Speed: 80 to 100 percent of maximum rpm.
3) Acceleration: 0.1 to 999.9 seconds.
4) Deceleration: 0.1 to 999.9 seconds.
5) Current Limit: 30 to minimum of 150 percent of maximum rating.

b. Self-Protection and Reliability Features:

1) Surge suppression.
2) Loss of input signal protection.
3) Under- and overvoltage trips.
4) Variable-frequency motor controller and motor-overload/overtemperature protection.
5) Critical frequency rejection.
6) Loss-of-phase protection.
7) Reverse-phase protection.
8) Motor-overtemperature fault.

c. Bidirectional autospeed search.
d. Torque boost.
e. Motor temperature compensation at slow speeds.

1) Panel-mounted operator station.
2) Historical logging information and displays.
3) Digital indicating devices.

f. Control Signal Interface: Electric.
g. Proportional Integral Directive (PID) control interface.
h. DDC system for HVAC Protocols for Network Communications: ASHRAE 135.

4. Line Conditioning:

a. Input line conditioning.
b. Output filtering.
c. EMI/RFI filtering.

© 2026 CDM Smith
All Rights Reserved

2.5 COIL SECTION

A. General Requirements for Coil Section:

1. Comply with AHRI 410.
2. Fabricate coil section to allow removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coil(s).
3. For multizone units, provide air deflectors and air baffles to balance airflow across coils.
4. Coils shall not act as structural component of unit.

B. Heating Coils:

1. Hot-Water Coils: Self-draining.

a. Piping Connections: Threaded, same end of coil.
b. Tube Material: Copper.
c. Fin Type: Plate.
d. Fin Material: Aluminum.
e. Headers:

1) Cast iron with drain and air vent tappings.
2) Seamless copper tube with brazed joints, prime coated.
3) Fabricated steel, with brazed joints, prime coated.
4) Provide insulated cover to conceal exposed outside casings of headers.

f. Frames: Channel frame, 0.0625-inch-thick, stainless steel.
g. Coil Working-Pressure Ratings: 200 psig, 325 deg F.
h. Coating: Corrosion-resistant coating.

2.6 AIR FILTRATION SECTION

A. Panel Filters:

1. Description: Pleated factory-fabricated, self-supported, disposable air filters with holding frames.
2. Filter Unit Class: UL 900.
3. Media: Interlaced glass, synthetic, or cotton fibers coated with nonflammable adhesive.
4. Filter-Media Frame: Beverage board with perforated metal retainer, or metal grid, on outlet side.

B. Side-Access Filter Mounting Frames:

1. Particulate Air Filter Frames: Match inner casing and outer casing material, and insulation thickness. Aluminum track.

a. Prefilters: Incorporate an integral 2-inch-thick track with same access as primary filter.
b. Sealing: Incorporate positive-sealing device to ensure seal between gasketed material on channels to seal top and bottom of filter cartridge frames to prevent bypass of unfiltered air.

2.7 DAMPERS

A. Outdoor- and Return-Air Dampers: Low-leakage, double-skin, airfoil-blade, aluminum dampers with compressible jamb seals and extruded-vinyl blade edge seals in opposed-blade arrangement with zinc-replated steel operating rods rotating in stainless steel sleeve bearings mounted in a single aluminum frame, and with operating rods connected with a common linkage. Leakage rate shall not exceed 4 cfm/sq. ft. at 1-inch wgand 8 cfm/sq. ft.at 4-inch wg

B. Electronic Damper Operators:

1. Direct-coupled type designed for minimum 60,000 full-stroke cycles at rated torque.
2. Electronic damper position indicator shall have visual scale indicating percent of travel and 2- to 10-V dc, feedback signal.
3. Operator Motors:

    a. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
    b. Size to operate with sufficient reserve power to provide smooth modulating action or two-position action.
    c. Permanent Split-Capacitor or Shaded-Pole Type: Gear trains completely oil immersed and sealed. Equip spring-return motors with integral spiral-spring mechanism in housings designed for easy removal for service or adjustment of limit switches, auxiliary switches, or feedback potentiometer.

4. Nonspring-Return Motors for Dampers Larger Than 25 Sq. Ft.: Size for running torque of 150 in. x lbf and breakaway torque of 300 in. x lbf.
5. Spring-Return Motors for Dampers Larger Than 25 Sq. Ft.: Size for running and breakaway torque of 150 in. x lbf.
6. Size dampers for running torque calculated as follows:

    a. Parallel-Blade Damper with Edge Seals: 7 inch-lb/sq. ft. of damper.
    b. Opposed-Blade Damper with Edge Seals: 5 inch-lb/sq. ft. of damper.
    c. Parallel-Blade Damper without Edge Seals: 4 inch-lb/sq. ft of damper.
    d. Opposed-Blade Damper without Edge Seals: 3 inch-lb/sq. ft. of damper.
    e. Dampers with 2- to 3-Inch wg of Pressure Drop or Face Velocities of 1000 to 2500 fpm: Increase running torque by 1.5.
    f. Dampers with 3- to 4-Inch wg of Pressure Drop or Face Velocities of 2500 to 3000 fpm: Increase running torque by 2.0.

7. Coupling: V-bolt and V-shaped, toothed cradle.
8. Overload Protection: Electronic overload or digital rotation-sensing circuitry.
9. Fail-Safe Operation: Mechanical, spring-return mechanism with external, manual gear release on nonspring-return actuators.
10. Power Requirements (Two-Position Spring Return): 24 V.
11. Power Requirements (Modulating): Maximum 10 VA at 24 V ac or 8 W at 24 V dc.
12. Proportional Signal: 2 to 10 V dc or 4 to 20 mA, and 2- to 10-V dc position feedback signal.
13. Temperature Rating: Minus 22 to plus 122 deg F.
14. Run Time: 60 seconds.

C. Mixing Section: Multiple-blade, air-mixer assembly located immediately downstream of mixing section.

D. Combination Filter and Mixing Section:

1. Cabinet support members shall hold 2-inch-thick, pleated, flat, permanent or throwaway filters.
2. Multiple-blade, air-mixer assembly shall mix air to prevent stratification, located immediately downstream of mixing box.

2.8 INTAKE AND RELIEF AIR OPENINGS

A. Provide hood, including moisture eliminator, over all unit intake and relief openings. Match material and finish of casing exterior.

2.9 MATERIALS

A. Steel:

1. ASTM A36/A36M for carbon structural steel.
2. ASTM A568/A568M for steel sheet.

B. Stainless Steel:

1. Manufacturer's standard grade for casing.
2. Manufacturer's standard type, ASTM A240/A240M for bare steel exposed to airstream or moisture.

C. Galvanized Steel: ASTM A653/A653M.

D. Aluminum: ASTM B209.

E. Corrosion-Resistant Coating: Coat with a corrosion-resistant coating capable of withstanding a 3000-hour salt-spray test according to ASTM B117.

1. Standards:

a. ASTM B117 for salt spray.
b. ASTM D2794 for minimum impact resistance of 100 in-lb.
c. ASTM B3359 for cross-hatch adhesion of 5B.

2. Application: Immersion.
3. Thickness: 1 mil.
4. Gloss: Minimum gloss of 60 on a 60-degree meter.

2.10 SOURCE QUALITY CONTROL

A. AHRI 430 Certification: Air-handling units and their components shall be factory tested according to AHRI 430 and shall be listed and labeled by AHRI.

B. AMCA 301 or AHRI 260: Air-handling unit fan sound ratings shall comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data," or AHRI 260, "Sound Rating of Ducted Air Moving and Conditioning Equipment."

C. Fan Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Fans shall bear AMCA-certified sound ratings seal.

D. Fan Performance Rating: Factory test fan performance for airflow, pressure, power, air density, rotation speed, and efficiency. Rate performance according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating."

E. Water Coils: Factory tested to 300 psig according to AHRI 410 and ASHRAE 33.

F. Witnessed Casing Leakage Tests:

1. Pay for all expenses, for one representative designated by Owner, to travel to the factory to witness cabinet air-leakage testing on the specific assembled unit(s) prior to release for delivery to Project site.
2. If the unit(s) does not meet specified leakage requirements, perform factory modifications and retest. Do not release unit for shipment until tested leakage is measured to be within specified leakage and leakage testing report has been accepted by Owner's designated representative.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.

C. Examine roughing-in for steam, hydronic, and condensate drainage piping systems and electrical services to verify actual locations of connections before installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Unit Support: Install unit level on structural steel supports. Coordinate wall penetrations and flashing with roof construction. Secure units to structural support with anchor bolts. Coordinate sizes and locations of steel supports with actual equipment provided.

1. Comply with requirements for vibration isolation devices specified in Section 230548.13 "Vibration Controls for HVAC."

B. Arrange installation of units to provide access space around air-handling units for service and maintenance.

C. Do not operate fan system until filters (temporary or permanent) are in place.

D. Install filter-gauge, static-pressure taps upstream and downstream of filters. Mount filter gauges on outside of filter housing or filter plenum in accessible position. Provide filter gauges on filter banks, installed with separate static-pressure taps upstream and downstream of filters.

E. Connect duct to air-handling units with flexible connections. Comply with requirements in Section 233300 "Air Duct Accessories."

3.3 PIPING CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to air-handling unit, allow space for service and maintenance.

C. Connect piping to air-handling units mounted on vibration isolators with flexible connectors.

D. Hot- and Chilled-Water Piping: Comply with applicable requirements in Section 232113 "Hydronic Piping" and Section 232116 "Hydronic Piping Specialties." Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.

3.4 ELECTRICAL CONNECTIONS

A. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

B. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

C. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.

D. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.
   1. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.

3.5 CONTROL CONNECTIONS

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring according to Section 260523 "Control-Voltage Electrical Power Cables."

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Verify that shipping, blocking, and bracing are removed.
3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
6. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
7. Comb coil fins for parallel orientation.
8. Verify that proper thermal-overload protection is installed for electric coils.
9. Install new, clean filters.
10. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.

B. Starting procedures for air-handling units include the following:

1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm.
2. Measure and record motor electrical values for voltage and amperage.
3. Manually operate dampers from fully closed to fully open position and record fan performance.

3.7 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC" for air-handling system testing, adjusting, and balancing.

C. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.8 CLEANING

A. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

3.9 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Leak Test: After installation, fill water and steam coils with water, and test coils and connections for leaks.
2. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.

D. Prepare test and inspection reports.

3.10 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain air-handling units.

1. Instructor shall be factory trained and certified.
2. Provide not less than eight hours of training.
3. Train personnel in operation and maintenance and to obtain maximum efficiency in plant operation.
4. Provide instructional videos showing general operation and maintenance that are coordinated with operation and maintenance manuals.
5. Obtain Owner sign-off that training is complete.
6. Owner training shall be held at Project site.

SECTION 238216.11 - HYDRONIC AIR COILS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes hydronic heating and cooling air coils.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each air coil.
2. Include rated capacities, operating characteristics, and pressure drops for each air coil.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air coils to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 DESCRIPTION

A. ASHRAE Compliance: Comply with applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

2.2 COILS

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Modine Manufacturing Company.
2. Super Radiator Coils.
3. Trane.

B. Performance Ratings: Tested and rated according to AHRI 410 and ASHRAE 33.

© 2026 CDM Smith
All Rights Reserved

C. Minimum Working-Pressure/Temperature Ratings: 200 psig, 325 deg F.

D. Source Quality Control: Factory tested to 300 psig.

E. Tubes: ASTM B743 copper,

F. Fins: Aluminum,

G. Headers: Cast iron with drain and air vent tappings.

H. Frames: ASTM A666, Type 316 stainless steel, minimum 0.0625 inch thick for flanged mounting.

I. Coating: Corrosion-resistant.

1. Comply with Section 230546 "Coatings for HVAC" for corrosion-resistant coating.
2. Corrosion-Resistant Coating: Coat with a corrosion-resistant coating capable of withstanding a 3000-hour salt-spray test according to ASTM B117.

a. Standards:

1) ASTM B117 for salt spray.
2) ASTM D2794 for minimum impact resistance of 100 in-lb
3) ASTM B3359 for cross hatch adhesion of 5B.

b. Application: Immersion.
c. Thickness: 1 mil.
d. Gloss: Minimum gloss of 60 on a 60-degree meter.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine ducts, plenums, and casings to receive air coils for compliance with requirements for installation tolerances and other conditions affecting coil performance.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before coil installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install coils level and plumb.

B. Install coils in metal ducts and casings constructed according to SMACNA's "HVAC Duct Construction Standards, Metal and Flexible."

C. Install stainless steel drain pan under each cooling coil.

1. Construct drain pans with connection for drain; insulated and complying with ASHRAE 62.1.
2. Construct drain pans to extend beyond coil length and width and to connect to condensate trap and drainage.
3. Extend drain pan upstream and downstream from coil face.
4. Extend drain pan under coil headers and exposed supply piping.

D. Install moisture eliminators for cooling coils. Extend drain pan under moisture eliminator.

E. Straighten bent fins on air coils.

F. Clean coils using materials and methods recommended in writing by manufacturers, and clean inside of casings and enclosures to remove dust and debris.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to coils to allow service and maintenance.

C. Connect water piping with unions and shutoff valves to allow coils to be disconnected without draining piping. Control valves are specified in Section 230923.11 "Control Valves," and other piping specialties are specified in Section 232116 "Hydronic Piping Specialties."

SECTION 260010 - SUPPLEMENTAL REQUIREMENTS FOR ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Supplemental requirements generally applicable to the Work specified in Division 26. This Section is also referenced by related Work specified in other Divisions.

B. Related Requirements:

1. Division 03 “Concrete” for cast in place concrete work, including concrete encasements for electrical duct banks, equipment pads, and light pole bases.
2. Division 40 “Process Interconnections” for SCADA, instrumentation, and process control equipment.
3. Division 22
4. Division 23
5. Division 43

1.3 REFERENCES

A. Abbreviations and Acronyms for Electrical Terms and Units of Measure:

1. 8P8C: An 8-position 8-contact modular jack.
2. A: Ampere, unit of electrical current.
3. AC or ac: Alternating current.
4. AFCI: Arc-fault circuit interrupter.
5. AIC: Ampere interrupting capacity.
6. AL, Al, or ALUM: Aluminum.
7. ASD: Adjustable-speed drive.
8. ATS: Automatic transfer switch.
9. AWG: American wire gauge; see ASTM B258.
10. BAS: Building automation system.
11. BIL: Basic impulse insulation level.
12. BIM: Building information modeling.
13. CAD: Computer-aided design or drafting.
14. CATV: Community antenna television.
15. CB: Circuit breaker.
16. cd: Candela, the SI fundamental unit of luminous intensity.
17. CO/ALR: Copper-aluminum, revised.

18. COPS: Critical operations power system.
19. CU or Cu: Copper.
20. CU-AL or AL-CU: Copper-aluminum.
21. dB: Decibel, a unitless logarithmic ratio of two electrical, acoustical, or optical power values.
22. dB(A-weighted) or dB(A): Decibel acoustical sound pressure level with A-weighting applied in accordance with IEC 61672-1.
23. dB(adjusted) or dBa: Decibel weighted absolute noise power with respect to 3.16 pW (minus 85 dBm).
24. dBm: Decibel absolute power with respect to 1 mW.
25. DC or dc: Direct current.
26. DCOA: Designated critical operations area.
27. DDC: Direct digital control (HVAC).
28. EGC: Equipment grounding conductor.
29. ELV: Extra-low voltage.
30. EMF: Electromotive force.
31. EMI: Electromagnetic interference.
32. EPM: Electrical preventive maintenance.
33. EPS: Emergency power supply.
34. EPSS: Emergency power supply system.
35. ESS: Energy storage system.
36. EV: Electric vehicle.
37. EVPE: Electric vehicle power export equipment.
38. EVSE: Electric vehicle supply equipment.
39. fc: Footcandle, an internationally recognized unit of illuminance equal to one lumen per square foot or 10.76 lx. The simplified conversion 1 fc = 10 lx in the Specifications is common practice and considered adequate precision for building construction activities. When there are conflicts, lux is the primary unit; footcandle is specified for convenience.
40. FLC: Full-load current.
41. ft: Foot.
42. ft-cd: Foot-candle, the antiquated U.S. Standard unit of illuminance, equal to one international candle measured at a distance of one foot, that was superseded in 1948 by the unit "footcandle" after the SI unit candela (cd) replaced the international candle; see "fc,"
43. GEC: Grounding electrode conductor.
44. GFCI: Ground-fault circuit interrupter.
45. GFPE: Ground-fault protection of equipment.
46. GND: Ground.
47. HACR: Heating, air conditioning, and refrigeration.
48. HDPE: High-density polyethylene.
49. HID: High-intensity discharge.
50. HP or hp: Horsepower.
51. HVAC: Heating, ventilating, and air conditioning.
52. Hz: Hertz.
53. IBT: Intersystem bonding termination.
54. inch: Inch. To avoid confusion, the abbreviation "in." is not used.
55. IP: Ingress protection rating (enclosures); Internet protocol (communications).
56. IR: Infrared.
57. IS: Intrinsically safe.
58. IT&R: Inspecting, testing, and repair.
59. ITE: Information technology equipment.

60. kAIC: Kiloampere interrupting capacity.
61. kcmil or MCM: One thousand circular mils.
62. kV: Kilovolt.
63. kVA: Kilovolt-ampere.
64. kVAr or kVAR: Kilovolt-ampere reactive.
65. kW: Kilowatt.
66. kWh: Kilowatt-hour.
67. LAN: Local area network.
68. lb: Pound (weight).
69. lbf: Pound (force).
70. LCD: Liquid-crystal display.
71. LCDI: Leakage-current detector-interrupter.
72. LED: Light-emitting diode.
73. Li-ion: Lithium-ion.
74. lm: Lumen, the SI derived unit of luminous flux.
75. LNG: Liquefied natural gas.
76. LP-Gas: Liquefied petroleum gas.
77. LRC: Locked-rotor current.
78. LV: Low voltage.
79. lx: Lux, the SI derived unit of illuminance equal to one lumen per square meter.
80. m: Meter.
81. MCC: Motor-control center.
82. MDC: Modular data center.
83. MG set: Motor-generator set.
84. MIDI: Musical instrument digital interface.
85. MLO: Main lugs only.
86. MV: Medium voltage.
87. MVA: Megavolt-ampere.
88. mW: Milliwatt.
89. MW: Megawatt.
90. MWh: Megawatt-hour.
91. NC: Normally closed.
92. Ni-Cd: Nickel-cadmium.
93. Ni-MH: Nickel-metal hydride.
94. NIU: Network interface unit.
95. NO: Normally open.
96. NPT: National (American) standard pipe taper.
97. OCPD: Overcurrent protective device.
98. ONT: Optical network terminal.
99. PC: Personal computer.
100. PCS: Power conversion system.
101. PCU: Power-conditioning unit.
102. PF or pf: Power factor.
103. PHEV: Plug-in hybrid electric vehicle.
104. PLC: Programmable logic controller.
105. PLFA: Power-limited fire alarm.
106. PoE: Power over Ethernet.
107. PV: Photovoltaic.
108. PVC: Polyvinyl chloride.
109. pW: Picowatt.
110. RFI: (electrical) Radio-frequency interference; (contract) Request for interpretation.

111. RMS or rms: Root-mean-square.
112. RPM or rpm: Revolutions per minute.
113. SCADA: Supervisory control and data acquisition.
114. SCR: Silicon-controlled rectifier.
115. SPD: Surge protective device.
116. sq.: Square.
117. SWD: Switching duty.
118. TCP/IP: Transmission control protocol/Internet protocol.
119. TEFC: Totally enclosed fan-cooled.
120. TR: Tamper resistant.
121. TVSS: Transient voltage surge suppressor.
122. UL: (standards) Underwriters Laboratories, Inc.; (product categories) UL, LLC.
123. UL CCN: UL Category Control Number.
124. UPS: Uninterruptible power supply.
125. USB: Universal serial bus.
126. UV: Ultraviolet.
127. V: Volt, unit of electromotive force.
128. V(ac): Volt, alternating current.
129. V(dc): Volt, direct current.
130. VA: Volt-ampere, unit of complex electrical power.
131. VAR: Volt-ampere reactive, unit of reactive electrical power.
132. VFC: Variable-frequency controller.
133. VFD: Variable-frequency drive. See VFC.
134. VOM: Volt-ohm-multimeter.
135. VPN: Virtual private network.
136. VRLA: Valve regulated lead acid; also called "sealed lead acid (SLA)" or "valve regulated sealed lead acid."
137. W: Watt, unit of real electrical power.
138. Wh: Watt-hour, unit of electrical energy usage.
139. WPT: Wireless power transfer.
140. WPTE: Wireless power transfer equipment.
141. WR: Weather resistant.

B. Abbreviations and Acronyms for Electrical Raceway Types:

1. EMT: Electrical metallic tubing.
2. EMT-A: Aluminum electrical metallic tubing.
3. EMT-S: Steel electrical metallic tubing.
4. EMT-SS: Stainless steel electrical metallic tubing.
5. ENT: Electrical nonmetallic tubing.
6. EPEC: Electrical HDPE underground conduit (thin wall).
7. EPEC-A: Type A electrical HDPE underground conduit.
8. EPEC-B: Type B electrical HDPE underground conduit.
9. ERMC: Electrical rigid metal conduit.
10. ERMC-A: Aluminum electrical rigid metal conduit.
11. ERMC-S: Steel electrical rigid metal conduit.
12. ERMC-S-G: Galvanized-steel electrical rigid metal conduit.
13. ERMC-S-PVC: PVC-coated-steel electrical rigid metal conduit.
14. ERMC-SS: Stainless steel electrical rigid metal conduit.
15. FMC: Flexible metal conduit.
16. FMC-A: Aluminum flexible metal conduit.

17. FMC-S: Steel flexible metal conduit.
18. FMT: Steel flexible metallic tubing.
19. FNMC: Flexible nonmetallic conduit. See "LFNC."
20. GRS: Galvanized rigid steel conduit. See ERMC-S-G.
21. HDPE: HDPE underground conduit (thick wall).
22. HDPE-40: Schedule 40 HDPE underground conduit.
23. HDPE-80: Schedule 80 HDPE underground conduit.
24. IMC: Steel electrical intermediate metal conduit.
25. LFMC: Liquidtight flexible metal conduit.
26. LFMC-A: Aluminum liquidtight flexible metal conduit.
27. LFMC-S: Steel liquidtight flexible metal conduit.
28. LFMC-SS: Stainless steel liquidtight flexible metal conduit.
29. LFNC: Liquidtight flexible nonmetallic conduit.
30. LFNC-A: Layered (Type A) liquidtight flexible nonmetallic conduit.
31. LFNC-B: Integral (Type B) liquidtight flexible nonmetallic conduit.
32. LFNC-C: Corrugated (Type C) liquidtight flexible nonmetallic conduit.
33. PVC: Rigid PVC conduit.
34. PVC-40: Schedule 40 rigid PVC conduit.
35. PVC-80: Schedule 80 rigid PVC Conduit.
36. PVC-A: Type A rigid PVC concrete-encased conduit.
37. PVC-EB: Type EB rigid PVC concrete-encased underground conduit.
38. RAC: Rigid aluminum conduit. See ERMC-A.
39. RGS: Rigid galvanized steel conduit. See ERMC-S-G.
40. RMC: Rigid metal conduit. See ERMC.
41. RTRC: Reinforced thermosetting resin conduit.
42. RTRC-AG: Low-halogen, aboveground reinforced thermosetting resin conduit.
43. RTRC-AG-HW: Heavy wall, low-halogen, aboveground reinforced thermosetting resin conduit.
44. RTRC-AG-SW: Standard wall, low-halogen, aboveground reinforced thermosetting resin conduit.
45. RTRC-AG-XW: Extra heavy wall, low-halogen, aboveground reinforced thermosetting resin conduit.
46. RTRC-BG: Low-halogen, belowground reinforced thermosetting resin conduit.

C. Abbreviations and Acronyms for Electrical Single-Conductor and Multiple-Conductor Cable Types:

1. AC: Armored cable.
2. CATV: Coaxial general-purpose cable.
3. CATVP: Coaxial plenum cable.
4. CATVR: Coaxial riser cable.
5. CI: Circuit integrity cable.
6. CL2: Class 2 cable.
7. CL2P: Class 2 plenum cable.
8. CL2R: Class 2 riser cable.
9. CL2X: Class 2 cable, limited use.
10. CL3: Class 3 cable.
11. CL3P: Class 3 plenum cable.
12. CL3R: Class 3 riser cable.
13. CL3X: Class 3 cable, limited use.
14. CM: Communications general-purpose cable.

15. CMG: Communications general-purpose cable.
16. CMP: Communications plenum cable.
17. CMR: Communications riser cable.
18. CMUC: Under-carpet communications wire and cable.
19. CMX: Communications cable, limited use.
20. DG: Distributed generation cable.
21. FC: Flat cable.
22. FCC: Flat conductor cable.
23. FPL: Power-limited fire-alarm cable.
24. FPLP: Power-limited fire-alarm plenum cable.
25. FPLR: Power-limited fire-alarm riser cable.
26. IGS: Integrated gas spacer cable.
27. ITC: Instrumentation tray cable.
28. ITC-ER: Instrumentation tray cable, exposed run.
29. MC: Metal-clad cable.
30. MC-HL: Metal-clad cable, hazardous location.
31. MI: Mineral-insulated, metal-sheathed cable.
32. MTW: (machine tool wiring) Moisture-, heat-, and oil-resistant thermoplastic cable.
33. MV: Medium-voltage cable.
34. NM: Nonmetallic sheathed cable.
35. NMC: Nonmetallic sheathed cable with corrosion-resistant nonmetallic jacket.
36. NMS: Nonmetallic sheathed cable with signaling, data, and communications conductors, plus power or control conductors.
37. NPLF: Non-power-limited fire-alarm circuit cable.
38. NPLFP: Non-power-limited fire-alarm circuit cable for environmental air spaces.
39. NPLFR: Non-power-limited fire-alarm circuit riser cable.
40. NUCC: Nonmetallic underground conduit with conductors.
41. OFC: Conductive optical fiber general-purpose cable.
42. OFCG: Conductive optical fiber general-purpose cable.
43. OFCP: Conductive optical fiber plenum cable.
44. OFCR: Conductive optical fiber riser cable.
45. OFN: Nonconductive optical fiber general-purpose cable.
46. OFNG: Nonconductive optical fiber general-purpose cable.
47. OFNP: Nonconductive optical fiber plenum cable.
48. OFNR: Nonconductive optical fiber riser cable.
49. P: Marine shipboard cable.
50. PLTC: Power-limited tray cable.
51. PLTC-ER: Power-limited tray cable, exposed run.
52. PV: Photovoltaic cable.
53. RHH: (high heat) Thermoset rubber, heat-resistant cable.
54. RHW: Thermoset rubber, moisture-resistant cable.
55. SA: Silicone rubber cable.
56. SE: Service-entrance cable.
57. SER: Service-entrance cable, round.
58. SEU: Service-entrance cable, flat.
59. SIS: Thermoset cable for switchboard and switchgear wiring.
60. TBS: Thermoplastic cable with outer braid.
61. TC: Tray cable.
62. TC-ER: Tray cable, exposed run.
63. TC-ER-HL: Tray cable, exposed run, hazardous location.
64. THW: Thermoplastic, heat- and moisture-resistant cable.

65. THHN: Thermoplastic, heat-resistant cable with nylon jacket outer sheath.
66. THHW: Thermoplastic, heat- and moisture-resistant cable.
67. THWN: Thermoplastic, moisture- and heat-resistant cable with nylon jacket outer sheath.
68. TW: Thermoplastic, moisture-resistant cable.
69. UF: Underground feeder and branch-circuit cable.
70. USE: Underground service-entrance cable.
71. XHH: Cross-linked polyethylene, heat-resistant cable.
72. XHHW: Cross-linked polyethylene, heat- and moisture-resistant cable.

D. Definitions:

1. 8-Position 8-Contact (8P8C) Modular Jack: An unkeyed jack with up to eight contacts commonly used to terminate twisted-pair and multiconductor Ethernet cable. Also called a "TIA-1096 miniature 8-position series jack" (8PSJ), or an "IEC 8877 8-pole jack."

    a. Be careful when suppliers use "RJ45" generically. Obsolete RJ45 jacks used for analog telephone cables have rejection keys. 8P8C jacks used for digital telephone cables and Ethernet cables do not have rejection keys.

2. Basic Impulse Insulation Level (BIL): Reference insulation level expressed in impulse crest voltage with a standard wave not longer than 1.5 times 50 microseconds and 1.5 times 40 microseconds.
3. Cable: In accordance with NIST NBS Circular 37 and IEEE standards, in the United States for the purpose of interstate commerce, the definition of "cable" is (1) a conductor with insulation, or a stranded conductor with or without insulation (single-conductor cable); or (2) a combination of conductors insulated from one another (multiple-conductor cable).
4. Communications Jack: A fixed connecting device designed for insertion of a communications cable plug.
5. Communications Outlet: One or more communications jacks, or cables and plugs, mounted in a box or ring, with a suitable protective cover.
6. Conductor: In accordance with NIST NBS Circular 37 and IEEE standards, in the United States for the purpose of interstate commerce, the definition of "conductor" is (1) a wire or combination of wires not insulated from one another, suitable for carrying an electric current; (2) (National Electrical Safety Code) a material, usually in the form of wire, cable, or bar, suitable for carrying an electric current; or (3) (general) a substance or body that allows a current of electricity to pass continuously along it.
7. Designated Seismic System: A system component that requires design in accordance with Ch. 13 of ASCE/SEI 7 and for which the Component Importance Factor is greater than 1.0.
8. Direct Buried: Installed underground without encasement in concrete or other protective material.
9. Duct-Bank: A protective underground system of raceways arranged in a matrix topology which is encased in concrete. Duct-banks can either be reinforced with rebar or not.
10. Enclosure: The case or housing of an apparatus, or the fence or wall(s) surrounding an installation, to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage. Types of enclosures and enclosure covers include the following:

a. Cabinet: An enclosure that is designed for either surface mounting or flush mounting and is provided with a frame, mat, or trim in which a swinging door or doors are or can be hung.
b. Concrete Box: A box intended for use in poured concrete.
c. Conduit Body: A means for providing access to the interior of a conduit or tubing system through one or more removable covers at a junction or terminal point. In the United States, conduit bodies are listed in accordance with outlet box requirements.
d. Conduit Box: A box having threaded openings or knockouts for conduit, EMT, or fittings.
e. Cutout Box: An enclosure designed for surface mounting that has swinging doors or covers secured directly to and telescoping with the walls of the enclosure.
f. Device Box: A box with provisions for mounting a wiring device directly to the box.
g. Extension Ring: A ring intended to extend the sides of an outlet box or device box to increase the box depth, volume, or both.
h. Floor Box: A box mounted in the floor intended for use with a floor box cover and other components to complete the floor box enclosure.
i. Floor-Mounted Enclosure: A floor box and floor box cover assembly with means to mount in the floor that is sealed against the entrance of scrub water at the floor level.
j. Floor Nozzle: An enclosure used on a wiring system, intended primarily as a housing for a receptacle, provided with a means, such as a collar, for surface-mounting on a floor, which may or may not include a stem to support it above the floor level, and is sealed against the entrance of scrub water at the floor level.
k. Hand-hole: A small underground enclosure with an access cover, designed to allow access inside to pull, splice or maintain underground cables. The enclosure is only big enough to allow a person’s hand/arm to reach in only.
l. Junction Box: A box with a blank cover that joins different runs of raceway or cable and provides space for connection and branching of the enclosed conductors.
m. Outlet Box: A box that provides access to a wiring system having pryout openings, knockouts, threaded entries, or hubs in either the sides or the back, or both, for the entrance of conduit, conduit or cable fittings, or cables, with provisions for mounting an outlet box cover, but without provisions for mounting a wiring device directly to the box.
n. Man-hole: A large underground secure concrete vault designed to house and protect un-grounded and grounded conductors and splices. The vault is large enough for a person to enter to perform electrical work, pull, splice and maintain underground cables.
o. Pedestal Floor Box Cover: A floor box cover that, when installed as intended, provides a means for typically vertical or near-vertical mounting of receptacle outlets above the floor's finished surface.
p. Pull Box: A box with a blank cover that joins different runs of raceway and provides access for pulling or replacing the enclosed cables or conductors.
q. Raised-Floor Box: A floor box intended for use in raised floors.
r. Recessed Access Floor Box: A floor box with provisions for mounting wiring devices below the floor surface.
s. Recessed Access Floor Box Cover: A floor box cover with provisions for passage of cords to recessed wiring devices mounted within a recessed floor box.
t. Ring: A sleeve, which is not necessarily round, used for positioning a recessed wiring device flush with the plaster, concrete, drywall, or other wall surface.

u. Ring Cover: A box cover, with raised center portion to accommodate a specific wall or ceiling thickness, for mounting wiring devices or luminaires flush with the surface.
v. Termination Box: An enclosure designed for installation of termination base assemblies consisting of bus bars, terminal strips, or terminal blocks with provision for wire connectors to accommodate incoming or outgoing conductors, or both.

11. Emergency Systems: Those systems legally required and classed as emergency by municipal, state, federal, or other codes, or by any governmental agency having jurisdiction that are designed to ensure continuity of lighting, electrical power, or both, to designated areas and equipment in the event of failure of the normal supply for safety to human life.
12. Fault Limited: Providing or being served by a source of electrical power that is limited to not more than 100 W when tested in accordance with UL 62368-1.

    a. The term "fault limited" is intended to encompass most Class 1, 2, and 3 power-limited sources complying with Article 725 of NFPA 70; Class ES1 and ES2 electrical energy sources that are Class PS1 electrical power sources (e.g., USB); and Class ES3 electrical energy sources that are Class PS1 and PS2 electrical power sources (e.g., PoE). See UL 62368-1 for discussion of classes of electrical energy sources and classes of electrical power sources.

13. Jacket: A continuous nonmetallic outer covering for conductors or cables.
14. Luminaire: A complete lighting unit consisting of a light source such as a lamp, together with the parts designed to position the light source and connect it to the power supply. It may also include parts to protect the light source or the ballast or to distribute the light.
15. Mode: The terms "Active Mode," "Off Mode," and "Standby Mode" are used as defined in the Energy Independence and Security Act (EISA) of 2007.
16. Multi-Outlet Assembly: A type of surface, flush, or freestanding raceway designed to hold conductors, receptacles, and switches, assembled in the field or at the factory.
17. Plenum: A compartment or chamber to which one or more air ducts are connected and that forms part of the air distribution system.
18. Receptacle: A fixed connecting device arranged for insertion of a power cord plug. Also called a power jack.
19. Receptacle Outlet: One or more receptacles mounted in a box with a suitable protective cover.
20. Sheath: A continuous metallic covering for conductors or cables.
21. UL Category Control Number (CCN): An alphabetic or alphanumeric code used to identify product categories covered by UL's Listing, Classification, and Recognition Services.
22. Voltage Class: For specified circuits and equipment, voltage classes are defined as follows:

    a. Control Voltage: Having electromotive force between any two conductors, or between a single conductor and ground, that is supplied from a battery or other Class 2 or Class 3 power-limited source.
    b. Line Voltage: (1) (controls) Designed to operate using the supplied low-voltage power without transformation. (2) (transmission lines, transformers, SPDs) The line-to-line voltage of the supplying power system.

c. Extra-Low Voltage (ELV): Not having electromotive force between any two conductors, or between a single conductor and ground, exceeding 30 V(ac rms), 42 V(ac peak), or 60 V(dc).
d. Low Voltage (LV): Having electromotive force between any two conductors, or between a single conductor and ground, that is rated above 30 V but not exceeding 1000 V.
e. Medium Voltage (MV): Having electromotive force between any two conductors, or between a single conductor and ground, that is rated about 1 kV but not exceeding 69 kV.
f. High Voltage: (1) (circuits) Having electromotive force between any two conductors, or between a single conductor and ground, that is rated above 69 kV but not exceeding 230 kV. (2) (safety) Having sufficient electromotive force to inflict bodily harm or injury.

23. Wire: In accordance with NIST NBS Circular 37 and IEEE standards, in the United States for the purpose of interstate commerce, the definition of "wire" is a slender rod or filament of drawn metal. A group of small wires used as a single wire is properly called a "stranded wire." A wire or stranded wire covered with insulation is properly called an "insulated wire" or a "single-conductor cable." Nevertheless, when the context indicates that the wire is insulated, the term "wire" will be understood to include the insulation.

1.4 INTERPRETATION OF CONTRACT DOCUMENTS

A. If during performance of work, there is a conflict, error, or discrepancy between or among Contract Documents and laws and regulations, provide the higher performance standard unless otherwise directed by Engineer.

B. Priority of Documents: Figured dimensions govern over scaled dimensions, detailed drawings govern over general drawing, larger scale drawings take precedence over smaller scale drawings, change order drawings supersede original contract drawings, and contract drawings govern shop drawings.

C. In general, Drawings do not show conduit routing. Plan and route conduits in compliance with specifications and drawing details. Coordinate installation with other trades and actual supplied equipment.

D. Ductbank routing shown on electrical site plans is diagrammatic in nature and may not include interferences that may be present.

1.5 COORDINATION

A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions:

1. Notify Owner no fewer than seven days in advance of proposed interruption of electrical service.
2. Do not proceed with interruption of electrical service without Owner's written permission.

B. Arrange to provide temporary electrical service or power in accordance with requirements specified in Division 01.

1.6 PREINSTALLATION MEETINGS

A. Schedule Preconstruction Meeting and other Preinstallation Meetings in accordance with Project Meetings Section in Division 01.

1.7 SEQUENCING

A. Conduct and submit results of preliminary power system studies before submitting Product Data and Shop Drawings for electrical equipment.

B. Coordinate all work in accordance with Specification 013513.24Special Procedure for MOPO and Construction Sequence.

C. Coordinate installation work with other trades.

1.8 ACTION SUBMITTALS

A. Submit Division 26 equipment and materials as specified in each Section at one time and not piecemeal. For example, all low voltage motor control centers on a project are to be submitted under one submittal number. Submittals that do not comply will be returned disapproved.

B. Subject to Engineer’s approval, related items may be submitted together under one submittal. Contractor shall identify the multiple Sections included. For example, multiple Sections specify lighting fixtures and poles. A single submittal for lighting could be acceptable.

C. Electrical Installation Drawings:

1. Drawings in general do not show conduit routing other than major conduit and ductbank routes. Submit conduit layouts for exposed, concealed, and buried conduits.
2. Submit electrical room layouts using approved shop drawing dimensions for equipment.
3. Submit layouts at an appropriate scale for clarity.
4. Include type written conduit schedules for easy cross check.
5. Installation submittal drawing must be approved before concrete pours are made that will conceal conduits.

D. Training Plans: Submit instructional program outline for Engineer’s review and approval, where demonstration and/or training is specified.

1.9 INFORMATIONAL SUBMITTALS

A. Electrical Installation Schedule: At preconstruction meeting, and periodically thereafter as dates change, provide schedule for electrical installation Work to Owner and Engineer including, but not limited to, milestone dates for the following activities:

1. Submission of power system studies.

2. Submission of specified coordination drawings.
3. Submission of action submittals specified in Division 26.
4. Orders placed for major electrical equipment.
5. Arrival of major electrical equipment on-site.
6. Preinstallation meetings specified in Division 26.
7. Utility service outages.
8. Utility service inspection and activation.
9. Closing of walls and ceilings containing electrical Work.
10. Conduit/conductor schedule, wire/cable ID scheme, duct-bank layouts, duct-bank sections, underground rough-in sketches, equipment conduit windows, etc.
11. System startup, testing, and commissioning activities for major electrical equipment.
12. System startup, testing, and commissioning activities for emergency lighting.
13. System startup, testing, and commissioning activities for automation systems (SCADA, BMS, lighting, HVAC, fire alarm, fire pump, etc.).
14. Pouring of concrete housekeeping pads for electrical equipment and testing of concrete samples.
15. Requests for special inspections.
16. Requests for inspections by authorities having jurisdiction.

B. Delegated Design Drawings: As indicated in individual Division 26 Sections.

C. Seismic Qualification Data: In accordance with Section 260011 “Facility Performance Requirement for Electrical” and individual Division 26 Sections.

D. Wind-Load Performance Data: In accordance with Section 260011 “Facility Performance Requirement for Electrical” and individual Division 26 Sections.

E. Qualification Statements: In accordance with individual Division 26 Sections.

1.10 CLOSEOUT SUBMITTALS

A. Record Documents: Submit documentation to accurately show completed installation. Include modifications to Contract Documents (one line power diagrams, equipment elevations, panel schedules, elementary control diagrams, riser diagrams, plans, conduit and ductbank routing, etc.) along with additional drawings or sketches created to convey completed installation.

1. Point-to-Point Connection Diagrams

a. General: Provide coordinated point-to-point (PTP) interconnection diagrams for each power, control, signal, instrumentation, and communications circuit furnished under this Contract or requiring connection to equipment furnished under other Divisions.
b. Drawing Format: Prepare diagrams using AutoCAD 2025. Provide one complete circuit or loop per 24-inch by 36-inch drawing. Use a consistent horizontal or vertical arrangement, divide drawings by device location, avoid overcrowding, and reserve space for future circuit data. Drawings shall remain legible when reduced to half size.
c. Standards: Prepare diagrams in accordance with ISA-5.4. Use symbols consistent with the Contract Drawings and symbol sheets. Instrumentation symbols shall

conform to ANSI/ISA-5.1 and shall be supplemented as required to show connection points, power sources, and operating details.

d. Submittal Milestones: Submit PTP diagrams in the following two phases:

1) Pre-Installation Submittal: Submit representative sample diagrams and complete, coordinated PTP diagrams for each system after receipt of applicable approved vendor submittals and before fabrication of control panels, pulling conductors or cables, making field terminations, or installing associated wiring. Submit five representative sample diagrams for CM review and acceptance of drawing format, equipment and device identification, conductor and cable identification methodology, and level of detail. Include samples for:

a) a motor with remote devices connected to a motor control center or starter;
b) a chemical system with a vendor control panel, remote power source, instruments, controls, and RTU;
c) a variable-frequency drive with motor, remote devices, control panels, PLC panels, and RTU;
d) an instrument connected to its local control panel; and
e) a sluice or slide gate with power and remote controls. Incorporate CM review comments into the complete PTP diagrams before beginning installation of the associated work.

2) Post-Installation Record Submittal: Upon completion of installation, testing, checkout, and startup, field-verify each PTP diagram against the installed work and submit final record PTP diagrams showing the complete as-installed configuration. Revise the diagrams to incorporate field modifications and final equipment and device tags, cable and conductor identifications, terminal assignments, power sources, protective devices, grounding and shield terminations, and I/O assignments. Correct discrepancies between the diagrams and installed work before submittal. Submit final record PTP diagrams before Substantial Completion and as part of the operation and maintenance manual submittal.

e. Diagram Content: Show all equipment and circuit components required for operation, including analog, digital, and discrete devices; relays; switches; starters; panels; terminal blocks; junction and pull boxes; intermediate terminations; and field-mounted components. Show circuit origins and destinations, terminal-strip designations, conductor and cable numbers, equipment and device tags, panel terminal-board numbers, computer input/output connections, and applicable Contract Drawing and shop-drawing references.

f. Power and Grounding: Trace each power source to its source panel, protective device, terminal block, and final utilization equipment, and identify the voltage, phase, circuit number, and protective-device rating, as applicable. Show equipment grounding conductors, grounding electrode conductor connections, instrument or signal reference grounds, isolated grounds, cable shields, and drain wires, as applicable. Identify each grounding termination point and distinguish between connections made at the source end, load end, both ends, or left unterminated. Show shield continuity through intermediate terminal blocks and junction boxes, and identify single-point shield grounding requirements. Do not use the same

symbol or designation for equipment grounding, isolated or reference grounding, and cable-shield grounding.

g. Locations and Functions: Identify device locations, including field, panel, auxiliary equipment, termination cabinet, local control panel, switchgear, motor control center, and panelboard locations. Provide circuit-function descriptions and clearly identify special operations, safety circuits, interlocks, and shutdown functions.

h. Identification and Tagging: Assign each PTP diagram a unique diagram number. Coordinate equipment, device, loop, and mnemonic designations with the P&IDs, loop diagrams, approved vendor submittals, equipment lists, I/O lists, and Section 407000A. Assign each multiconductor cable a unique cable identification number and identify each conductor, twisted pair, triad, or fiber within the cable by a unique conductor or circuit designation. Provide durable, permanent identification at both ends of each cable and conductor and at each accessible intermediate termination, including devices, equipment, terminal blocks, junction boxes, pull boxes, terminal cabinets, manholes, and handholes. Identification shown on the PTP diagrams, field labels, cable schedules, wire database, and record documents shall match. Use the project identification hierarchy for facility code, system code, tag type, tag number, and subcomponent, where applicable. Do not reuse an identification number for a different cable, conductor, device, or termination.

i. Coordination: Coordinate diagrams with related work under other Divisions and with vendor drawings. Resolve discrepancies before fabrication or installation.

j. Wire Database: Provide a Microsoft Access database correlating each wire identification number with the associated equipment and drawings. Configure the database to permit sorting and querying.

1) Database Fields: Include wire identification number; wire size and type; equipment tag at each termination; terminal strip and terminal position at each end; building identification code; process system code; shop drawing and page reference; and PTP diagram number.

2) Database Submittal: Submit five electronic copies on CD-ROM and seven hard copies for review and inclusion in the operation and maintenance manuals.

k. Wire Schedule: Sort by wire identification number, terminating equipment identification, and termination-point identification.

l. Equipment Schedule: For each equipment tag, identify the applicable PTP diagram, wire identification numbers, terminating equipment, terminal-strip and terminal identifications, and shop-drawing references. Sort by equipment tag, PTP diagram number, and wire identification number.

m. System Schedule: Sort by system code, equipment tag, and PTP diagram number.

B. Operation and Maintenance Data:

1. Provide emergency operation, normal operation, and preventive maintenance manuals for each system, equipment, and device as specified in each Division 26 Section.

1.11 DELEGATED DESIGN / PROFESSIONAL ENGINEERING SERVICES

A. When engineering services are specified to be provided by Contractor, retain a licensed professional engineer to perform the services. Engineer shall be licensed at the time services are

performed and licensed in the state in which project is located. If the state issues discipline specific licenses, Engineer shall be licensed in the applicable discipline. Engineer shall be experienced in the type of work being performed.

B. Engineering work shall be done according to the applicable regulations for professional engineers to include signing, sealing, and dating documents.

1.12 QUALIFICATIONS

A. Comply with Quality Assurance Articles within each Division 26 Section.

B. Electrical Contractor Minimum Requirements: Regularly engaged in the installation of industrial medium voltage systems for a minimum period of 10 years.

C. On Site Field Superintendent:

1. Minimum of 10 years of experience of industrial low and medium voltage projects of comparable size and complexity.
2. Be present (or designated substitute with minimum experience as above) during medium voltage cable pulling and testing, during medium voltage switching activity, and during medium voltage equipment change over or start-up activities.

1.13 MATERIALS AND EQUIPMENT

A. Provide new materials and equipment unless specifically noted otherwise.

B. NEMA enclosure types are listed on the Drawings and/or the specifications.

C. Electrical materials and equipment must be listed by Underwriter's Laboratories, Inc. (UL**)** or other National Recognized Testing Laboratory (NRTL) and bear the appropriate listing or classification marking. Equipment not bearing a UL certification shall be field or factor UL certified prior to acceptance and use.

D. Provide major electrical equipment by a single manufacturer, i.e. unit substations, switchgear, motor control centers, disconnect switches, transformers, panelboards, etc.

E. Variable frequency controllers, when provided as a stand-alone package with the driven equipment and therefore not included in a motor control center are not to be required to be by a single manufacturer.

1.14 HAZARDOUS AREAS

A. Drawings may indicate and define NEC hazardous classified locations.

B. Equipment and materials installed in hazardous areas shall be UL listed for the appropriate Class and Division and in accordance with NEC Articles 500, 501, 502, and 503 as applicable.

© 2026 CDM Smith
All Rights Reserved

1.15 EQUIPMENT SIZE, HANDLING, AND STORAGE

A. Coordinate with equipment manufacturer shipping splits to permit safe handling and passage of equipment to final installation location.

B. Comply with manufacturer’s instructions for upright equipment orientation during transportation.

C. Protect equipment from mechanical injury, or exposure to moisture, chemicals, or corrosive gases. Do not store indoor rated electrical equipment outdoors.

D. Provide and energize temporary space heaters if required to control moisture during storage.

1.16 FIELD CONDITIONS

A. Modeling, analysis, product selection, installation, and quality control for Work specified in Division 26 must comply with requirements specified in Section 260011 "Facility Performance Requirements for Electrical."

B. Service Conditions for Electrical Power Equipment: Besides conditions specified in Section 260011 "Facility Performance Requirements for Electrical," specified electrical power equipment must be suitable for operation under service conditions specified as usual service conditions in applicable NEMA PB series, IEEE C37 series, and IEEE C57 series standards.

1.17 ELECTRICAL SYSTEM TESTING AND SETTINGS

A. Test electrical systems and equipment in accordance with individual sections and Section 260800 “Commissioning of Electrical Systems”. This includes motors or other electrical equipment which are not specified in Division 26.

B. Set and adjust controls, timers, relays, adjustable trip units, protective devices, and other electrical components in accordance with manufacturers instructions and the approved power system study. Do not energize equipment without correctly setting adjustable components.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 SLEEVES AND FORMS FOR OPENINGS

A. Provide and place sleeves for conduits and slots for electrical work prior to concrete pour.

B. Use approved shop drawings and equipment vendor templates to determine exact locations for stub-ups and terminating concealed conduit and place before floor slab pour.

C. Seal openings, sleeves, penetration and slots in accordance with Section 260544 “Sleeves and Sleeve Seals for Electrical Raceways and Cabling.”

© 2026 CDM Smith
All Rights Reserved

3.2 CUTTING AND PATCHING

A. Cut and patch in a workmanlike manner as required to install electrical work.

B. Modify concrete in accordance with Division 3 “Concrete.”

C. Do not cut joists, beams, girders, columns, or other structural members.

D. Patch surfaces to restore to original integrity (waterproof or fireproof as required) and appearance.

E. Core drill holes in concrete floors and walls as required. Prior to coring concrete, scan slab or wall using radar to locate and identify rebar and/or conduit and wiring. Locate cores to avoid cutting or drilling through rebar and/or conduits. Space conduits to not weaken structural integrity. Notify Engineer immediately if rebar is cut or upon becoming aware of discrepancies within area of work.

3.3 DEMOLITION AND DISPOSITION OF EQUIPMENT

A. Drawings showing removal of major mechanical and electrical equipment is not intended to show all components to be demolished. Not all piping, conduits, ducts, equipment, ancillary devices, etc. are shown. Field verify existing conditions prior to bid.

B. Unless otherwise specifically noted, remove unused exposed conduit and support systems back to source and/or point of concealment including above accessible ceiling finishes. Wiring shall be removed.

C. Cut flush with slab, ceiling, or wall abandoned concealed conduit. Suitably plug conduits.

D. Repair and restore adjacent construction and finishes after demolition is complete.

E. Material and equipment indicated for removal or demolition is to become the Contractor’s property upon removal, unless noted otherwise. Removed material to be properly handled and disposed.

3.4 INSTALLATION OF ELECTRICAL WORK

A. Unless more stringent requirements are specified in the Contract Documents or manufacturers' written instructions, comply with NFPA 70 and NECA NEIS 1 for installation of Work specified in Division 26. Consult Engineer for resolution of conflicting requirements.

3.5 FIELD QUALITY CONTROL

A. Field testing, startup services, and system functional testing may be provided by the Contractor, and/or the manufacturer’s factory-authorized service representative, and/or an independent testing agency. Provide testing and/or startup service as specified in the relevant section.

B. Comply with Section 260800 “Commissioning of Electrical Systems”.

© 2026 CDM Smith
All Rights Reserved

C. Submit Field Quality-Control Report as informational submittal within 14 days of each completed test or startup. Include within the report adjustments / as left settings.

3.6 CLEANING

A. Remove rubbish and debris from inside and around electrical equipment and enclosures.

B. Remove dirt, dust or concrete spatter from interior and exterior of equipment using brushes, vacuum cleaner, or clean lint-free rags. Do not use compressed air.

3.7 CLOSEOUT ACTIVITIES

A. Provide demonstration and training as specified in each section.

END OF SECTION 260010

SECTION 260011 - FACILITY PERFORMANCE REQUIREMENTS FOR ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Field conditions and other facility performance requirements applicable to Work specified in Division 26.

B. Related Requirements:

1. Section 260010 “Supplemental Requirements for Electrical” for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.

1.3 FIELD CONDITIONS

A. Altitude:

1. Sea level to 1000 ft..

B. Ambient Temperature:

1. Average High of 85 degrees Farenheit.
2. Average Low of 22 degrees Farenheit.

C. Temperature Variation: Allow for thermal movements from the following differential temperatures:

1. Outdoor Ambient Temperature Differential: 120 degrees F.
2. Material Surface Temperature Differential: 180 degrees F.
3. Ground Surface Temperature Differential to 10 foot Depth.

D. Ground Water:

1. Assume ground-water level is at grade level unless a lower water table is noted on Drawings.

E. Hazardous and / or Corrosive Environmental Conditions: As indicated on the Drawings.

SECTION 260505 - SELECTIVE DEMOLITION FOR ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Removal of existing electrical equipment, wiring, and conduit in areas to be remodeled; removal of designated construction; dismantling, cutting and alterations for completion of the Work.
2. Disposal of materials.
3. Storage of removed materials.
4. Identification of utilities.
5. Salvaged items.
6. Protection of items to remain as indicated on Drawings.
7. Relocate existing equipment to accommodate construction.

B. Related Sections:

1. Section 024119 “Selective Structure Demolition”: Removal of designated building equipment and construction.
2. Section 083113 “Access Doors and Frames”: Execution requirements for access doors and panels specified by this section.

1.3 ACTION SUBMITTALS

A. Shop Drawings: Indicate demolition and removal sequence and location of salvageable items; location and construction of temporary work. Describe demolition removal procedures and schedule.

1.4 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of capped conduits and equipment abandoned in place,.

1.5 QUALITY ASSURANCE

A. Perform Work in accordance with New York OSHA standards.

© 2026 CDM Smith
All Rights Reserved

1.6 PRE-INSTALLATION MEETINGS

A. Convene minimum one week prior to commencing work of this section.

1.7 SEQUENCING

A. Sequence work in accordance with Section 013513.24 “Special Procedures for MOPO and Construction Sequence”.

1.8 SCHEDULING

A. Schedule work to coincide with new construction.

B. Cease operations immediately when structure appears to be in danger and notify Engineer/Engineer. Do not resume operations until directed.

1.9 COORDINATION

A. Conduct demolition to minimize interference with adjacent and occupied building areas.

B. Coordinate demolition work in accordance with the Sequence of Construction.

C. Coordinate and sequence demolition so as not to cause shutdown of operation of surrounding areas.

D. Equipment, building or structures scheduled for complete demolition shall be made safe from electrical shock hazard prior to demolition.

E. Shut-down Periods:

1. Arrange timing of shut-down periods of in service panels with Construction Manager. Do not shut down any utility without prior written approval.
2. Keep shut-down period to minimum or use intermittent period as directed by Construction Manager.
3. Maintain life-safety systems in full operation in occupied facilities, or provide notice minimum 3 days in advance.

F. Identify salvage items in cooperation with Owner.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify wiring and equipment indicated to be demolished serve only abandoned facilities.

B. Verify termination points for demolished services.

3.2 PREPARATION

A. Erect, and maintain temporary safeguards, including warning signs and lights, barricades, and similar measures, for protection of the public, Owner, Contractor's employees, and existing improvements to remain.

B. Temporary egress signage and emergency lighting

3.3 REMOVAL AND DISPOSAL OF LEGALLY REGULATED MATERIALS

A. Material and equipment indicated to be removed and disposed of will become the Contractor's property. Dispose of material and equipment offsite, unless otherwise directed by the Owner. Provide the Owner with a receipt indicating the acceptable disposal of any legally regulated materials or equipment.

B. Assume that the ballasts in each existing lighting fixture contain PCB's, unless specifically marked with a label indicating "No PCBs." Remove ballasts from each lighting fixture and pack them in accordance with EPA PCB regulations. Ship ballasts in approved containers to an EPA approved recycling facility; pay all shipping, packaging and recycling costs.

C. Remove, package, ship and dispose of PCBs, mercury and PCB/mercury contaminated equipment, in accordance with all State and Federal regulations. Retain the services of a firm licensed and regularly engaged in the removal of PCBs and PCB contaminated equipment. Retain a firm licensed in the State or States in which the contaminated material is handled, shipped and disposed of. Pay all fees associated with the removal of the contaminated material and equipment. Submit documentation indicating acceptable disposal.

D. If PCB’s or mercury contaminated equipment are discovered that were not identified; cease work on or about the equipment and notify the Engineer immediately.

3.4 DEMOLITION

A. Demolition Drawings are based on casual field observation and existing record documents. Report discrepancies to Engineer/Engineer before disturbing existing installation.

B. Remove exposed abandoned conduit, including abandoned conduit above accessible ceiling finishes. Cut conduit flush with walls and floors, and patch surfaces.

C. Remove conduit, wire, boxes, and fastening devices to avoid any interference with new installation.

D. Disconnect electrical systems in walls, floors, and ceilings scheduled for removal.

E. Reconnect equipment being disturbed by renovation work and required for continue service to nearest available panel.

F. Disconnect or shut off service to areas where electrical work is to be removed. Remove electrical fixtures, equipment, and related switches, outlets, conduit and wiring which are not part of final project.

G. Install temporary wiring and connections to maintain existing systems in service during construction.

H. Perform work on energized equipment or circuits with experienced and trained personnel.

I. Remove, relocate, and extend existing installations to accommodate new construction.

J. Repair adjacent construction and finishes damaged during demolition and extension work.

K. Remove exposed abandoned grounding and bonding components, fasteners and supports, and electrical identification components, including abandoned components above accessible ceiling finishes. Cut embedded support elements flush with walls and floors.

L. Clean and repair existing equipment to remain or to be reinstalled.

M. Protect and retain power to existing active equipment remaining.

N. Cap abandoned empty conduit at both ends.

3.5 EXISTING PANELBOARDS

A. Ring out circuits in existing panel affected by the Work. Where additional circuits are needed, reuse circuits available for reuse. Install new breakers.

B. Tag unused circuits as spare.

C. Where existing circuits are indicated to be reused, use sensing measuring devices to verify circuits feeding Project area or are not in use.

D. Remove existing wire no longer in use from panel to equipment.

E. Provide new updated directories where more than three circuits have been modified or rewired.

3.6 SALVAGE ITEMS

A. Remove and protect items indicated on Drawings to be salvaged and turn over to Owner

B. Items of salvageable value may be removed as work progresses. Transport salvaged items from site as they are removed.

3.7 REUSABLE ELECTRICAL EQUIPMENT

A. Carefully remove equipment, materials, or fixtures which are to be reused.

© 2026 CDM Smith
All Rights Reserved

B. Disconnect, remove, or relocate existing electrical material and equipment interfering with new installation.

C. Relocate existing lighting fixtures as indicated on Drawings. Clean fixtures and re-lamp. Test fixture to see if it is in good working condition before installation at new location.

3.8 CLEANING

A. Remove demolished materials as work progresses. Legally dispose.

B. Keep workplace neat.

3.9 PROTECTION OF FINISHED WORK

A. Do not permit traffic over unprotected floor surface.

SECTION 260513 - MEDIUM-VOLTAGE CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes cables and related cable splices, terminations, and accessories for medium-voltage (2001 to 35,000 V) electrical distribution systems.

B. Section applies to temporary and permanent feeders used on the project.

C. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 DEFINITIONS

A. Jacket: A continuous nonmetallic outer covering for conductors or cables.

B. NETA ATS: Acceptance Testing Specification.

C. Sheath: A continuous metallic covering for conductors or cables.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of cable. Include splices and terminations for cables and cable accessories.

B. Work plan for each medium voltage system interruption. Include as a minimum:

1. Description of work to be accomplished.
2. Identification of circuits and facilities areas affected.
3. Using the project one line power diagrams, indicate state of affected switches and circuit breakers and locations for temporary safety grounds.
4. Estimated shutdown duration.

C. Switching and testing plans for hot phase and rotation checks.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Indicate location of each cable, splice, and termination.

B. Qualification Data: For Installer and testing agency.

C. Design Data: Cable pulling calculations (all MV cables at a min.), including conduit size and fill percentage, pulling tensions, cable sidewall pressure, jam probability, voltage drop, and ground wire sizing for each cable.

D. Source quality-control reports. Provide cable manufacturer’s certified test report for each cable reel.

E. Field quality-control reports.

F. Manufacturer’s cable warranty.

1.6 QUALITY ASSURANCE

A. Installer: Engage a cable splicer, trained and certified by splice material manufacturer, to install, splice, and terminate medium-voltage cable. Cable splicer must have at least 80 hours of formal training and a minimum of 10 years experience.

B. Testing Agency Qualifications: Member company of NETA or an NRTL.

1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Check for reels not completely restrained, reels with interlocking flanges or broken flanges, damaged reel covering or any other indication of damage. Do not drop reels from any height.

B. Unload reels using a sling and spreader bar. Roll reels in the direction of the arrows shown on the reel and on surfaces free of obstructions that could damage the cable.

C. Store cable on a solid, well drained location. Store unjacketed armored cable indoors. Cover cable reels with plastic sheeting or tarpaulin. Do not lay reels flat.

D. Seal cable ends with heat shrinkable end caps. Do not remove end caps until cables are ready to be terminated.

1.8 FIELD CONDITIONS

A. Interruption of Existing Electric Service: Submit detailed work plan for all interruptions involving medium voltage.

© 2026 CDM Smith
All Rights Reserved

1.9 WARRANTY

A. Manufacturer's Special Warranty: Warrant the cables against failures for a period of 20 years from the date of installation and remove and replace failed cables at manufacturer's expense during this warranty period.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with IEEE C2 and NFPA 70.

C. Source Limitations: Obtain cables and accessories from single source from single manufacturer.

2.2 CABLES

A. Description: Medium-voltage cable suitable for use in wet or dry locations, indoors or outdoors exposed to sunlight, in any raceway or underground duct, or directly buried. Sizes 1/0 AWG and larger may be installed in cable tray.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. General Cable; Prysmian Group North America.
2. Kerite Power Cable; Marmon Holdings, Inc.; Berkshire Hathaway Inc.
3. Okonite Company (The).

C. Cable Type: Type MV 105, UL listed, single conductor.

D. Conductor Insulation: Ethylene-propylene rubber.

1. Voltage Rating: 5 kV, as indicated on Drawings.
2. Insulation:

a. Rating: 133 percent insulation level.
b. BIL / Thickness:

1) 95 kV and 115 mils for 5 kV.

E. Operating Voltage: 4160V

F. Conductor: Copper.

G. Comply with UL 1072, AEIC CS8, ICEA S-93-639/ANSI/NEMA WC 74, and ICEA S-97-682.

H. Conductor Stranding: Compact round, concentric lay, Class B.

I. Shielding: Copper tape 5 mil minimum, helically applied over semiconducting insulation shield.

J. Overall Cable Jacket: Moisture, heat, abrasion, UV, and ozone resistant PVC jacket installed over the metallic shield.

K. Identification: Printing on outer jacket of cable to include manufacturer's name, voltage class, insulation type, insulation thickness, conductor size, UL listing, and manufactured date.

2.3 CONNECTORS

A. Comply with ANSI C119.4 for connectors between aluminum conductors or for connections between aluminum to copper conductors.

B. Copper-Conductor Connectors: Copper barrel crimped, tin-plated connectors, closed end construction to prevent moisture migration, and meet UL 486 requirements. Provide two-hole lugs with NEMA spacing for conductors 250 kcmil and larger.

2.4 SOLID TERMINATIONS

A. Shielded-Cable Terminations: Comply IEEE 48, Class 1 requirements. Insulation class equivalent to that of cable. Current rating equal to or greater than the cable ampacity. Include shield ground strap for shielded cable terminations. Include rain skirt for outdoor locations. Cable compartment of outdoor metal clad switchgear are considered as outdoor locations.

1. TE Connectivity (TE) Raychem heat shrink HVT-Z Series.

2.5 SPLICE KITS

A. Description: For connecting medium voltage cables; type as recommended by cable or splicing kit manufacturer for the application.

1. TE Connectivity (TE) Raychem heat shrink HVS Series.

B. Standard: Comply with IEEE 404.

C. Splicing Products: As recommended, in writing, by splicing kit manufacturer for specific sizes, materials, ratings, and configurations of cable conductors. Include all components required for complete splice, with detailed instructions.

2.6 ELECTRICAL GROUNDING BRAID

A. Conducting Metal Braid: Woven from 240 strands of 30 AWG tinned copper wires, capable of carrying fault current comparable to 6 AWG copper wire.

2.7 MEDIUM-VOLTAGE TAPES

A. Description: Electrical grade, insulating tape rated for medium voltage application.

B. Ethylene/propylene rubber-based, 30 mil splicing tape, rated for 130 degree C operation. Minimum 3/4 inch wide.

C. Silicone rubber-based, 12 mil self-fusing tape, rated for 130 degree C operation. Minimum 1-1/2 inches wide.

D. Insulating-putty, 125 mil elastic filler tape. Minimum 1-1/2 inches wide.

2.8 ARC-PROOFING MATERIALS

A. Description: Fire retardant, providing arc flash protection and limit damage to other cables that are in proximity.

B. Tape for First Course on Metal Objects: 10 mil thick, corrosion-protective, moisture-resistant, PVC pipe-wrapping tape.

C. Arc-Proofing Tape: Fireproof tape, flexible, conformable, intumescent to 0.3 inch thick, and compatible with cable jacket. 3M Scotch Fire-Retardant Electric Arc Proofing Tape 77 White or equal.

D. Glass-Cloth Tape: Pressure-sensitive adhesive type, 1 inch wide. 3M Scotch Tape 77 Series of equal.

2.9 PULLING COMPOUNDS

A. Pulling compound shall be nontoxic, nonflammable, noncombustible and noncorrosive. Material shall be UL listed and compatible with cable insulation and jacket.

2.10 SOURCE QUALITY CONTROL

A. Test and inspect cables according to AEIC CS8 or ICEA S-97-682 before shipping.

B. Upon completion of factory tests, seal cable against entrance of water.

PART 3 - EXECUTION

3.1 GENERAL

A. Determine cutting lengths, reel arrangements and total lengths of cable required and furnish to cable manufacturer.

B. When temperature is below 50 degrees F, store cable reels at 70 degrees F for at least 24 hours before installation.

© 2026 CDM Smith
All Rights Reserved

3.2 INSTALLATION

A. Install cables according to IEEE 576.

B. Proof conduits prior to conductor installation by passing a wire brush mandrel and then a rubber duct swab through the conduit. Separate the wire brush and the rubber swab by 48 to 72 inches on the pull rope.

1. Wire Brush Mandrel: Consists of a length of brush approximately the size of the conduit inner diameter with stiff steel bristles and an eye on each end for attaching the pull ropes. If an obstruction is felt, pull the brush back and forth repeatedly to break up the obstruction.
2. Rubber Duct Swab: Consists of a series of rubber discs approximately the size of the conduit inner diameter on a length of steel cable with an eye on each end for attaching the pull ropes. Pull the rubber duct swab through the duct to extract loose debris from the duct.

C. Pull Conductors: Use a dynamometer and constant velocity power pulling. Velocity should not be less than 15-ft/min or more than 50-ft/min. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

1. Use manufacturer approved pulling compound and lubricants.
2. Use pulling means, including fish tape, cable, rope, and basket-weave cable grips, that do not damage cables and raceways.
3. Do not use rope hitches for pulling attachment to cable.
4. Do not use steel fish tapes or steel pulling cables in PVC conduit runs.
5. Use pull-in guides, cable feeders, and draw-in protectors as required to protect cables during installation.
6. Do not pull cables with ends unsealed. Seal cable ends with rubber tape.
7. Pull cables from direction that requires the least tension.
8. Feed cables into raceway with zero tension and without cable crossover at raceway entrance.
9. Install heat shrinkable end caps on cable if cable cannot be terminated immediately after installation.

D. Install exposed cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours where possible.

E. Support cables according to Section 260529 "Hangers and Supports for Electrical Systems."

F. In manholes, handholes, pull boxes, junction boxes, and cable vaults, train cables around walls by the longest route from entry to exit; support cables at intervals adequate to prevent sag.

G. Route circuits within manholes to place different circuits on opposite sides of manholes where possible.

H. Install sufficient cable length to remove cable ends under pulling grips. Remove length of conductor damaged during pulling.

I. Install cable splices at pull points and elsewhere as indicated; use standard kits.

J. Install terminations at ends of conductors, and seal multiconductor cable ends with standard kits.

K. Install separable insulated-connector as indicated on Drawings.

L. Arc Proofing: Arc proof medium-voltage cables in manholes, cable trays, cable vaults, pull boxes, switchgear, and other areas where multiple circuits are present and are not protected by individual conduits or barriers.

M. Use arc-proofing materials in accordance with manufacturer’s instructions.

N. In addition to arc-proofing tape manufacturer's written instructions, apply arc proofing as follows:

1. Clean cable sheath.
2. Wrap metallic cable components with 10 mil pipe-wrapping tape.
3. Smooth surface contours with electrical insulation putty.
4. Apply arc-proofing tape in one half-lapped layer with coated side toward cable.
5. Band arc-proofing tape with two layers of 1 inch wide half-lapped, adhesive, glass-cloth tape at each end of the arc-proof tape.

O. Seal around cables passing through fire-rated elements according to Section 078413 "Penetration Firestopping."

P. Bond shields of shielded cable at terminations, splices, and separable insulated connector to the ground system. Maintain shield continuity and connectors to metal connection hardware at all connection points.

Q. Identify cables according to Section 260553 "Identification for Electrical Systems." Identify phase and circuit number of each conductor at each splice, termination, pull point, and junction box. Arrange identification so that it is unnecessary to move the cable or conductor to read the identification. Complete marking and termination prior to energization.

3.3 FIELD QUALITY CONTROL

A. Notify Engineer in writing at least two weeks prior to scheduling any testing.

B. Tests and Inspections: Comply with requirements in Section 260010 “Supplemental Requirements for Electrical” and Section 260800 “Commissioning of Electrical Systems.”

C. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

A. Inspect and test cable installation in accordance with NETA Standard ATS for new cables or NETA Standard MTS for existing cables. Include the following:

1. Visual and mechanical inspection.
2. Shield continuity test.
3. Insulation resistance test.
4. Dielectric withstand test using Very Low Frequency (VLF).

B. When cables are spliced, perform shield continuity and insulation resistance test, prior to splicing, on each individual cable section and again on the entire length after the splice complete. Perform dielectric withstand, hot phasing, and rotation tests on the completed section.

C. Include the following on all cable test reports:

1. Cable identification / designation / type.
2. Cable length / termination types at each end.
3. Test conditions (tester name, environmental conditions, date of test), test results, and recommendations.

D. Medium-voltage cables will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.4 ACCEPTANCE TESTING – HOT PHASING AND ROTATION CHECKS

A. Correct phasing (A, B, C landed on terminals 1, 2, 3) and rotation (clock-wise) of existing and new medium voltage systems is the Contractor's responsibility. As the project progresses in phases, phasing and rotation checks are required whenever medium voltage cables are moved, spliced, re-landed, or newly installed. Electricians performing these energized activities must be qualified for this type of hazardous activity.

B. Hot phase check:

1. Each newly installed Switch.

C. Submit to Engineer in writing at least two weeks prior to scheduling any hot phase and rotation checks, the hot phasing and rotation plan.

D. Responsibilities:

1. Switching existing equipment: Owner.
2. Switching modified or new equipment: Contractor.
3. Absence of voltage testing, safety grounding, lockout / tagout: Contractor.

E. Perform all hot phasing and rotation checks in the presence of Engineer.

F. In the event of improper phasing or rotation, the appropriate circuit will be shut down and the Contractor will correct the problem at his expense.

SECTION 260519 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Copper building wire.
2. Tray cable, Type TC.
3. Connectors and splices.

B. Related Requirements:

1. Section 260513 "Medium-Voltage Cables" for single-conductor and multiconductor cables, cable splices, and terminations for electrical distribution systems with 601 to 35 000 V.
2. Section 260523 "Control-Voltage Electrical Power Cables" for control systems communications cables and Classes 1, 2, and 3 control cables.
3. Section 271513 "Communications Copper Horizontal Cabling" for twisted pair cabling used for data circuits.

1.3 DEFINITIONS

A. VFC: Variable-frequency controller. Used interchangeably with VFD.

B. VFD: Variable frequency drive. See VFC.

1.4 ACTION SUBMITTALS

A. Product Data: Manufacturer’s cut sheet for each type of product used on project.

B. Product Schedule: Indicate type, use, location, and termination locations.

1.5 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 COPPER BUILDING WIRE

A. Description: Flexible, insulated and uninsulated, drawn copper current-carrying conductor with an overall insulation layer or jacket, or both, rated 600 V or less.

B. Standards:

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
2. Conductor and Cable Marking: Comply with wire and cable marking according to UL's "Wire and Cable Marking and Application Guide."

C. Conductors: Copper, complying with ASTM B3 for bare annealed copper and with ASTM B8 for stranded conductors.

D. Stranding: Refer to CONDUCTOR APPLICATIONS Article in PART 3.

E. Conductor Insulation:

1. Type RHW-2: Comply with UL 44.
2. Type TC-ER: Comply with NEMA WC 70/ICEA S-95-658 and UL 1277.
3. Type THHN and Type THWN-2: Comply with UL 83.
4. Type XHHW-2: Comply with UL 44.

2.2 Type TRAY CABLE, TYPE TC-ER FOR VFC APPLICATIONS

A. Type TC-ER: Shielded, stranded, tinned copper cable with three symmetrical ground conductors, XLPE insulation, PVC outer jacket, designed for use as output cable to motor from VFCs.

1. Nexans AmerCable Type 37-108VFD Flexible TC-ER VFD Power Cable or equal.
2. Conduit sizing on Drawings are based on using this manufacturer. Increase conduit size as required to comply with NEC if different manufacturer is submitted.
3. Nexans AmerCable Data:

Circuit Conductor Size (AWG)	Grounding Conductors (x 3) Size (AWG)	Nominal Diameter (inches)	Nexans AmerCable Part Number
12	16	0.509	37-108-516VFD
10	14	0.522	37-108-308VFD
8	14	0.653	37-108-309VFD
6	12	0.737	37-108-310VFD
4	12	0.956	37-108-312VFD
2	10	1.103	37-108-314VFD
1	10	1.221	37-108-315VFD
1/0	10	1.447	37-108-316VFD

Circuit Conductor Size (AWG)	Grounding Conductors (x 3) Size (AWG)	Nominal Diameter (inches)	Nexans AmerCable Part Number
2/0	10	1.538	37-108-317VFD
4/0	8	1.883	37-108-319VFD

2.3 CONNECTORS AND SPLICES

A. Description: Factory-fabricated connectors, splices, and lugs of size, ampacity rating, material, type, and class for application and service indicated; listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

B. Jacketed Cable Connectors: For steel and aluminum jacketed cables, zinc die-cast with set screws, designed to connect conductors specified in this Section.

C. Lugs: One piece, seamless, designed to terminate conductors specified in this Section.

1. Material: Tin-plated copper.
2. Type:

    a. One hole with long barrels for No. 8 AWG to No. 4/0 AWG.
    b. Two holes with long barrels for 250 kcmil and larger.
    c. Locking spade for No. 10 AWG and smaller.

3. Termination: Compression for No. 8 AWG and larger.

D. Connectors:

1. Solderless pressure type (wirenuts) for No. 10 AWG and smaller.
2. Pre-filled with silicone-based sealant for exterior, wet, or corrosive locations.
3. Split bolt type for No. 8 AWG and larger splices.

E. Motor Terminations: Mechanical compression ring type, secured with bolt, nut and spring washer.

PART 3 - EXECUTION

3.1 CONDUCTOR APPLICATIONS

A. Wires and Cables: Copper; stranded, except for lighting and receptacle wiring which may be solid. Minimum size for power circuits: No. 12 AWG.

B. Nominal 480/277VAC Power Circuits: Single conductors in raceway. Type XHHW-2 for sizes up to 4/0 and Type RHW-2 for size 250 kcmil and larger.

C. Nominal 240/208/120V Power Circuits: Single conductors in raceway. Type XHHW-2.

D. Grounding Conductors: Refer to Section 260526 “Grounding and Bonding for Electrical Systems”.

E. Control and Fire Alarm Circuits: Refer to Section 260523 “Control-Voltage Electrical Power Cables”.

F. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.

G. VFC Output Circuits: Type TC-ER with shield.

3.2 INSTALLATION, GENERAL

A. Conceal cables in finished walls, ceilings, and floors unless otherwise indicated.

B. Complete raceway installation between conductor and cable termination points in accordance with Section 260533.13 "Conduits for Electrical Systems" prior to pulling conductors and cables.

C. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

D. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

E. Use of steel fish tapes and/or steel pulling cables in PVC conduit or raceways that terminate into energized enclosures is prohibited.

F. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.

G. Support cables according to Section 260529 "Hangers and Supports for Electrical Systems."

3.3 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

B. Make splices, terminations, and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors. Do not splice service or feeder cables without prior written approval of Engineer.

C. Wiring at Outlets:

1. Install conductor at each outlet, with at least 6 inch of slack.
2. Form solid wire into loop to fit around device terminal screw. Do not overlap wire.

© 2026 CDM Smith
All Rights Reserved

3.4 IDENTIFICATION

A. Identify and color-code conductors and cables according to Section 260553 "Identification for Electrical Systems."

B. Identify each spare conductor at each end with identity number and location of other end of conductor, and identify as spare conductor.

3.5 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 260544 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.6 FIRESTOPPING

A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Section 078413 "Penetration Firestopping" .

3.7 FIELD QUALITY CONTROL

A. and "Tests and Inspections:

1. After installing conductors and cables and before electrical circuitry has been energized, test service entrance, and feeder conductors, and 480V power circuit conductors for compliance with requirements.
2. Perform each of the following visual and electrical tests:

    a. Inspect exposed sections of conductor and cable for physical damage and correct connection according to the single-line diagram.
    b. Test bolted connections for high resistance using one of the following:

        1) A low-resistance ohmmeter.
        2) Calibrated torque wrench.
        3) Thermographic survey.

    c. Inspect compression-applied connectors for correct cable match and indentation.
    d. Inspect for correct identification.
    e. Inspect cable jacket and condition.
    f. Insulation-resistance test on each conductor for ground and adjacent conductors. Apply a potential of 1000 V(dc) for 600 V rated cable for a one-minute duration. Minimum wire insulation resistance: 100 Megohms.
    g. Continuity test on each conductor and cable.
    h. Uniform resistance of parallel conductors.

B. Cables will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports to record the following:

© 2026 CDM Smith
All Rights Reserved

1. Procedures used.
2. Results that comply with requirements.
3. Results that do not comply with requirements, and corrective action taken to achieve compliance with requirements.

SECTION 260523 - CONTROL-VOLTAGE ELECTRICAL POWER CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Category 6 balanced twisted pair cable.
2. Balanced twisted pair cable hardware.
3. Control-circuit conductors.
4. Instrumentation cable.
5. Termination products.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: Manufacturer’s cut sheet for each type of product used on project.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Flame Travel and Smoke Density in Plenums: As determined by testing identical products according to NFPA 262, by a qualified testing agency. Identify products for installation in plenums with appropriate markings of applicable testing agency.

1. Flame Travel Distance: 60 inches or less.
2. Peak Optical Smoke Density: 0.5 or less.
3. Average Optical Smoke Density: 0.15 or less.

C. Flame Travel and Smoke Density for Riser Cables in Non-Plenum Building Spaces: As determined by testing identical products according to UL 1666.

D. Flame Travel and Smoke Density for Cables in Non-Riser Applications and Non-Plenum Building Spaces: As determined by testing identical products according to UL 1685.

E. RoHS compliant.

2.2 CATEGORY 6 BALANCED TWISTED PAIR CABLE

A. Description: Four-pair, balanced-twisted pair cable, with internal spline, certified to meet transmission characteristics of Category 6 cable at frequencies up to 250 MHz.

B. Standard: Comply with NEMA WC 66/ICEA S-116-732 and TIA-568-C.2 for Category 6 cables.

C. Conductors: 100 ohm, No. 23 AWG solid copper.

D. Shielding/Screening: Screened and shielded twisted pairs (F/FTP).

E. Cable Rating: Plenum.

F. Jacket: Gray thermoplastic.

G. Plenum-Rated Cable: NFPA 70, Type CMP.

1. Paired, two pairs, No. 22 AWG, stranded (7x30) tinned-copper conductors.
2. Fluorinated ethylene propylene insulation.
3. Unshielded.
4. Fluorinated ethylene propylene jacket.
5. Flame Resistance: NFPA 262.

2.3 CONTROL-CIRCUIT CONDUCTORS

A. Individual Conductors: Stranded copper, Type XHHW-2, complying with UL 44 in raceway.

B. Multi-conductor Control Cable: NEC type TC, stranded copper, Type XHHW-2, insulated color coded conductors including ground wire, overall PVC jacket. Rated for cable tray or direct burial use and sunlight resistant. Number of conductors as indicated on Drawings.

C. Minimum Size: No. 14 AWG for 120V circuits, No. 16 AWG for circuits 50V and less.

© 2026 CDM Smith
All Rights Reserved

2.4 INSTRUMENTATION CABLE

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Belden.
2. Rockbestos-Suprenant Cable Corp.

B. Single or Multiple Paired Cable: NEC Type ITC (Instrumentation Tray Cable), UL Type TC for 4-20mA process instrumentation signals and use under NEC Article 727.

1. One or Multi-pair, twisted, shielded, No. 16 AWG, stranded, tinned-copper conductors.
2. Voltage Rating: 300V.
3. Insulation: PVC.
4. Shield: 100 percent aluminum/polyester foil with drain wire. Pairs individually shielded.
5. Jacket: PVC with manufacturer's identification.
6. Standards: UL 1277 Type TC, UL 1581.
7. Single pair cable maximum overall diameter: 0.297-inches.

C. Triad (three conductor) Cable: NEC Type ITC (Instrumentation Tray Cable), UL Type TC for instrumentation signals and use under NEC Article 727.

1. Three conductor, twisted, shielded, No. 16 AWG, stranded, tinned-copper conductors.
2. Voltage Rating: 300V.
3. Insulation: PVC.
4. Shield: 100 percent aluminum/polyester foil with drain wire. Pairs individually shielded.
5. Jacket: PVC with manufacturer's identification.
6. Standards: UL 1277 Type TC, UL 1581.
7. Triad cable maximum overall diameter: 0.311-inches.

2.5 INDUSTRIAL ETHERNET CABLE

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Rockwell Automation 1585-C8HB-S.

B. Description: Four-pair, balanced-twisted pair cable, certified to meet transmission characteristics of Category 5e or Category 6 cable at frequencies up to 100 MHz *Ethernet/IP* compliant.

C. Conductors: 100-ohm, 22 AWG solid copper.

D. Shielding/Screening: Overall foil shield.

E. Cable Rating: 600V.

F. Jacket: PVC.

G. Standards: UL, UL PLTC, UL AWM 2570 80C 600V, TIA 568B.

© 2026 CDM Smith
All Rights Reserved

2.6 TERMINATIONS

A. Termination connectors for instrumentation and control conductors:

1. Tin plated copper.
2. Vinyl insulated.
3. Flanged spade / locking fork with upturned leg ends.
4. Crimp / compression installation.

B. Termination connector for industrial Ethernet cable: match conductor count, RJ45 type, intended for shielded cable. Rockwell Automation Bulletin 1585J or equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Test cables on receipt at Project site.

1. Test each pair of twisted pair cable for open and short circuits.

3.2 INSTALLATION OF RACEWAYS AND BOXES

A. Comply with requirements in Section 260533.13 "Conduits for Electrical Systems" for raceway selection and installation requirements for conduits as supplemented or modified in this Section.

B. Comply with requirements in Section 260533.23 "Surface Raceways for Electrical Systems" for raceway selection and installation requirements for wireways as supplemented or modified in this Section.

C. Comply with requirements in Section 260533.16 "Boxes and Covers for Electrical Systems" for raceway selection and installation requirements for boxes as supplemented or modified in this Section.

1. Outlet Boxes for Cables: No smaller than 4 inches square by 2-1/8 inches deep with extension ring sized to bring edge of ring to within 1/8 inch of the finished wall surface.
2. Flexible metal conduit is not allowed.

D. Comply with TIA-569-D for pull-box sizing and length of conduit and number of bends between pull points.

E. Install manufactured conduit sweeps and long-radius elbows if possible.

F. Raceway Installation in Equipment Rooms:

1. Position conduit ends adjacent to a corner on backboard if a single piece of plywood is installed, or in the corner of the room if multiple sheets of plywood are installed around perimeter walls of the room.
2. Install cable trays to route cables if conduits cannot be located in these positions.
3. Secure conduits to backboard if entering the room from overhead.

4. Extend conduits 3 inches above finished floor.
5. Install metal conduits with grounding bushings and connect with grounding conductor to grounding system.

G. Backboards: Install backboards with 96 inch dimension vertical. Butt adjacent sheets tightly and form smooth gap-free corners and joints.

3.3 INSTALLATION OF CONDUCTORS AND CABLES

A. Comply with requirements in Section 260519 “Low-Voltage Electrical Power Conductors and Cables” for installation requirements and as supplemented or modified in this Section.

B. Instrumentation and Ethernet cables may not be spliced and are to be continuous from terminal to terminal.

C. Install instrumentation and Ethernet cabling in separate raceway from control or power wiring.

D. Do not install bruised, kinked, scored, deformed, or abraded cable. Remove and discard cable if damaged during installation and replace it with new cable.

E. Separation from EMI Sources:

1. Separation between open instrumentation cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment as follows:

   a. Electrical Equipment or Circuit Rating Less Than 2 kVA: A minimum of 5 inches.
   b. Electrical Equipment or Circuit Rating between 2 and 5 kVA: A minimum of 12 inches.
   c. Electrical Equipment or Circuit Rating More Than 5 kVA: A minimum of 24 inches.

F. General Requirements for Telecommunications Cabling:

1. Comply with TIA-568-C Series of standards.
2. Comply with BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems."
3. Terminate all conductors; cable cannot contain unterminated elements. Make terminations only at indicated outlets, terminals, and cross-connect and patch panels.
4. Do not splice cable between termination, tap, or junction points. Make cables continuous from terminal to terminal.
5. Cables serving a common system may be grouped in a common raceway. Install network cabling and control wiring and cable in separate raceway from power wiring. Do not group conductors from different systems or different voltages.
6. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
7. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems." Install lacing bars and distribution spools.
8. Do not install bruised, kinked, scored, deformed, or abraded cable. Remove and discard cable if damaged during installation and replace it with new cable.

9. Cold-Weather Installation: Bring cable to room temperature before dereeling. Do not use heat lamps for heating.
10. Pulling Cable: Comply with BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems." Monitor cable pull tensions.
11. Support: Do not allow cables to lie on removable ceiling tiles.
12. Secure: Fasten securely in place with hardware specifically designed and installed so as to not damage cables.
13. Provide strain relief.
14. Keep runs short. Allow extra length for connecting to terminals. Do not bend cables in a radius less than 10 times the cable OD. Use sleeves or grommets to protect cables from vibration at points where they pass around sharp corners and through penetrations.
15. Grounding: Ground wire must be copper. Comply with IEEE C2. Demonstrate ground resistance.

G. Balanced Twisted Pair Cable Installation:

1. Comply with TIA-568-C.2.
2. Install termination hardware as specified in this section unless otherwise indicated.
3. Do not untwist balanced twisted pair cables more than 1/2 inch at the point of termination to maintain cable geometry.

3.4 REMOVAL OF CONDUCTORS AND CABLES

A. Remove abandoned conductors and cables. Abandoned conductors and cables are those installed that are not terminated at equipment and are not identified with a tag for future use.

3.5 GROUNDING

A. For data communication wiring, comply with TIA-607-B and with BICSI TDMM, "Bonding and Grounding (Earthing)" Chapter.

B. For instrumentation wiring, ground shield at one end only as recommended by instrument manufacturer and in accordance with Owner’s standard.

3.6 IDENTIFICATION

A. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Identify data and communications system components, wiring, and cabling according to TIA-606-B; label printers comply with UL 969 for label stocks, laminating adhesives, and inks.

C. Identify each wire on each end and at each terminal with a number-coded identification tag. Each wire shall have a unique tag.

3.7 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Visually inspect cable jacket materials for UL or third-party certification markings. Inspect cabling terminations to confirm color-coding for pin assignments, and inspect cabling connections to confirm compliance with TIA-568-C.1.
2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
3. Test cabling for direct-current loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination, but not after cross-connection.

    a. Test instruments shall meet or exceed applicable requirements in TIA-568-C.2. Perform tests with a tester that complies with performance requirements in its "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in its "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.

B. Document data for each measurement. Print data for submittals in a summary report that is formatted using Table 10.1 in BICSI TDMM as a guide, or transfer the data from the instrument to the computer, save as text files, print, and submit.

C. End-to-end cabling will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

SECTION 260526 - GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Grounding and bonding conductors.

B. Grounding and bonding materials and hardware.Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product used on the project.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

PART 2 - PRODUCTS

2.1 GROUNDING AND BONDING CONDUCTORS

A. Insulated Grounding and Bonding Conductor: Copper conductor, 600V with insulation type matching the circuit phase conductors called for in Section 260519 “Low-Voltage Electrical Power Conductors and Cables”, green color.

B. ASTM - Bare Copper Grounding and Bonding Conductor:

1. Referenced Standards: Complying with one or more of the following:

a. Soft or Annealed Copper Wire: ASTM B3.
b. Concentric-Lay Stranded Copper Conductor: ASTM B8.
c. Tin-Coated Soft or Annealed Copper Wire: ASTM B33.
d. 19-Wire Combination Unilay-Stranded Copper Conductor: ASTM B787/B787M.

2.2 GROUNDING AND BONDING MATERIALS AND HARDWARE

A. Performance Criteria:

1. Regulatory Requirements:

a. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2. Listing Criteria:

a. Grounding and Bonding Equipment: UL CCN KDER; including UL 467.
b. Grounding and Bonding Equipment for Communications: UL CCN KDSH; including UL 467.

B. Ground Rods: Copper clad steel, 3/4-inch by 10-feet, sectionalized as required by Drawings.

C. Grounding Conduit Hubs: Malleable iron type.

D. Water Pipe Ground Clamps: Cast bronze saddle type.

E. Exothermic-welding Kits: CADWELD process or equal.

1. Manufacturer kits to include molds and powder recommended by kit manufacturer for materials being joined and installation conditions.
2. Welds used indoors in occupied buildings or confined space to be low emission type, CADWELD EXOLON or equal.

F. Ground Rod Test Wells: As detailed on the Drawings.

G. Ground Enhancement Material (GEM): Low-resistance, non-corrosive, carbon dust based material that improves grounding effectiveness.

1. Contains cement, which hardens when set to provide a permanent, maintenance-free, low-resistant grounding system that never leaches or washes away.
2. Suitable for installation in trenches or backfilling around ground rods.
3. Resistivity of no more than 20 ohm-cm in cured state. ERICO Part No. GEM25A or equal.

H. Bus Bars: Rectangular bar of annealed copper. As detailed on the Drawings.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 SELECTION OF GROUNDING AND BONDING CONDUCTORS

A. Conductors: Install solid conductor for 10 AWG and smaller, and stranded conductors for 8 AWG and larger unless otherwise indicated.

B. Bonding Cable: 28 kcmil, 14 strands of 17 AWG conductor, 1/4 inch in diameter.

C. Bonding Conductor: 4 AWG or 6 AWG, stranded conductor.

D. Bonding Jumper: Copper tape, braided conductors terminated with copper ferrules; 1-5/8 inch wide and 1/16 inch thick.

E. Tinned Bonding Jumper: Tinned-copper tape, braided conductors terminated with copper ferrules; 1-5/8 inch wide and 1/16 inch thick.

F. Underground Grounding Conductors: Install barecopper conductor, size as indicated on Drawings.

1. Bury at least 30 inches below grade.
2. Duct-Bank Grounding Conductor: Bury 12 inches above duct bank when indicated as part of duct-bank installation.

3.2 SELECTION OF CONNECTORS

A. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
3. Connections to Ground Rods at Test Wells: Bolted connectors.
4. Connections to Structural Steel: Welded connectors.

3.3 INSTALLATION

A. Comply with manufacturer's published instructions.

B. Reference Standards:

1. Ground Bonding Common with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in conduit.
2. Consult Engineer for resolution of conflicting requirements.

C. Special Techniques:

1. Grounding Electrode Conductors:

    a. Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.
    b. Where conductors pass through floor slabs, walls, etc., install in conduit or sleeve.
    c. When conductors need to be installed in conduit for mechanical protection, use non-ferrous conduit to avoid a choke effect for fault currents.

2. Connections: Make connections so possibility of galvanic action or electrolysis is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact are galvanically compatible.

    a. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer in order of galvanic series.
    b. Make connections with clean, bare metal at points of contact.
    c. Make aluminum-to-steel connections with stainless steel separators and mechanical clamps.
    d. Make aluminum-to-galvanized-steel connections with tin-plated copper jumpers and mechanical clamps.
    e. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.
    f. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.

        1) Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate adjacent parts.
        2) Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
        3) Use exothermic-welded connectors for outdoor locations; if disconnect-type connection is required, use bolted clamp.

    g. Grounding and Bonding for Piping:

        1) Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use bolted clamp connector or bolt lug-type connector to pipe flange by using one of lug bolts of flange. Where dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
        2) Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with bolted connector.
        3) Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

    h. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install bonding jumper to bond across flexible duct connections to achieve continuity.

i. Grounding for Steel Building Structure: Install as indicated on Drawings.

1) Locate attachment points not subject to mechanical damage, but accessible for inspection.
2) Use exothermic weld process for wire sizes 1/0 AWG and larger. When wire size is smaller than 1/0 AWG, weld a pigtail of 1/0 AWG to structural steel then mechanically connect the two wires.

3. Grounding Separately Derived Systems:

a. Transformers: Bond neutral and ground with a bonding jumper at the equipment in accordance with NEC 250.102. Connect to the grounding electrode system via the electrode grounding conductor in accordance with NEC Table 250.66 or as indicated on the Drawings.
b. Generators and UPS: When indicated on the Drawings as a separately derived system, bond neutral and ground with a bonding jumper at the equipment in accordance with NEC 250.102. Connect to the grounding electrode system via the electrode grounding conductor in accordance with NEC Table 250.66 or a indicated on the Drawings.
c. Generator: Install grounding electrode(s) at generator location. Electrode must be connected to equipment grounding conductor and to frame of generator.

4. Grounding Underground Distribution System Components:

a. Comply with IEEE C2 grounding requirements.

5. Grounding and Bonding Manholes and Handholes: Install as indicated on Drawings. Bond exposed-metal parts to ground rod or grounding conductor. Grounding and Bonding of Raceways, Cable Trays, Boxes, and Enclosures:

a. Terminate metallic conduit into pressed steel boxes using double locknuts (same metal type as conduit) and insulated grounding bushings.
b. Terminate metallic conduit into metallic gasketed enclosures using Meyers grounding type conduit hubs.
c. Use insulated throat grounding bushings with lay-in type lugs to terminate metallic conduits containing equipment grounding conductors into sheet steel boxes.
d. Bond metallic electrical system components such as cable trays, supports, brackets, braces, boxes, etc. to the raceway system if they are not rigidly secured to and in contact with the raceway system or are subject to vibration and loosening.
e. Provide a bonding jumper across hinged metal panels or doors when electrical components in excess of 24 volts are mounted on the moveable panel.
f. Provide a grounding bushing at the end of metallic conduits that terminate in free air.
g. Provide 12 AWG insulated green wire bonding jumper for metal outlet boxes that contain receptacles. Connect wire from receptacle ground terminal to box using grounding screw.

6. Equipment Grounding:

a. Install insulated equipment grounding conductors with feeders and branch circuits.

b. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.
c. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.
d. Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.
e. Metallic Fences: Comply with requirements of IEEE C2.

1) Grounding Conductor: Bare copper, not less than 6 AWG.
2) Gates: Must be bonded to grounding conductor with flexible bonding jumper.
3) Barbed Wire: Strands must be bonded to grounding conductor.

3.4 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with calibrated torque wrench in accordance with manufacturer's published instructions.
3. Test completed grounding system at each location where maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, at ground test wells, and at individual ground rods. Make tests at ground rods before conductors are connected.

a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
b. Perform tests by fall-of-potential method in accordance with IEEE Std 81.
c. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Engineer promptly and include recommendations to reduce ground resistance.

B. Nonconforming Work:

1. Grounding system will be considered defective if it does not pass tests and inspections.
2. Remove and replace defective components and retest.

C. Collect, assemble, and submit test and inspection reports.

1. Report measured ground resistances that exceed the following values:

a. Power and Lighting Equipment or System with Capacity of 500 kVA and Less: 10 Ω (ohms).
b. Power and Lighting Equipment or System with Capacity over 500 kVA: 5 Ω (ohms).

3.5 PROTECTION

A. After installation, protect grounding and bonding cables and equipment from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

SECTION 260529 - HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Support, anchorage, and attachment components.
2. Fabricated metal equipment support assemblies.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
3. Section 260548 "Vibration and Seismic Controls for Electrical Systems" for products and installation requirements necessary for compliance with seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section criteria.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product used on the project.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for the following: channel support systems, conduit support hardware, and accessories.
2. Include rated capacities and furnished specialties and accessories.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. For fabrication and installation details for electrical hangers and support systems.

1. Hangers. Include product data for components.
2. Slotted support systems.
3. Equipment supports.
4. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

1.4 DELEGATED DESIGN SUBMITTALS

A. For hangers and supports for electrical systems.

1. Include design calculations and details of hangers.
2. Include design calculations for seismic restraints.

B. Qualifications Statement: Submit qualifications for licensed professional.

1.5 QUALITY ASSURANCE

A. Delegated Design Engineer: Licensed professional engineer experienced in design of specified Work and licensed in the jurisdiction of the project location.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified structural professional engineer, as defined in Section 014000 “Quality Requirements”, to design hanger and support system.

B. Surface-Burning Characteristics for Nonmetallic Channel Systems and Accessories: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame Rating: Class 1.
2. Self-extinguishing according to ASTM D635.

2.2 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Aluminum Channel:

1. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
2. Channel Material: 6063-T5 aluminum alloy.
3. Fittings and Accessories Material: 5052-H32 aluminum alloy.

B. Stainless Steel Channel:

1. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
2. Material for Channel, Fittings, and Accessories: Stainless steel, Type 316.

C. Hot-dipped Galvanized Steel Channel:

1. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
2. Material for Channel, Fittings, and Accessories: Hot-dipped galvanized steel.

D. Nonmetallic Channel:

1. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
2. Channel Material: Ultraviolet resistant FRP.
3. Fittings and Accessories Material: Stainless steel, Type 316 or compatible non-metallic.

E. Accessories: Conduit clamps, straps, hangers, rods, backplates, anchors, nuts, washers, etc. to correspond with channel material as listed in the SELECTION Article. Use of galvanized steel components is only allowed with galvanized steel channel.

F. Threaded Rod: 3/8-inch diameter, minimum.

G. Expansion Anchors: 3/8-inch minimum diameter. Equal to “Kwik Bolt”, manufactured by McCullock Industries; “Wej it” manufactured by Wej it Expansion Products; or “Kwik-Bolt II” manufactured by Hilti Fastening Systems.

PART 3 - EXECUTION

3.1 SELECTION OF CHANNEL

A. Dry, indoor, conditioned, non-process space: Hot dipped galvanized steel.

B. Outdoor, process areas, or areas indicated on Drawings as “DUST”, “DAMP”, or WET”: Aluminum and/or stainless steel, depending upon load requirements.

C. Areas indicated on Drawings as “CORROSIVE”: Nonmetallic.

3.2 INSTALLATION

A. Comply with the following standards as applicable for selection and installation of hangers and supports, except where requirements on Drawings or in this Section are stricter:

1. NECA NEIS 101: Standard for Installing Steel Conduits.
2. NECA NEIS 102: Standard for Installing Aluminum Rigid Metal Conduits.
3. NECA NEIS 105: Standard for Installing Metal Cable Tray Systems.
4. NECA NEIS 111: Standard for Installing Nonmetallic Raceways.

B. Provide vibration and seismic controls with hangers and supports in accordance with requirements specified in "Section 260548 "Vibration and Seismic Controls for Electrical Systems."

C. Attach support systems only to structural components. Do not attach any electrical device, enclosure, raceway, supports, etc. to hand-rails, stair-wells or ladder-wells. Use concrete expansion anchors for attachment to concrete surfaces.

D. Provide a minimum of 1/2-inch clearance between wall and equipment when installing surface mounted panel boxes, junction boxes, conduit, etc.

E. Space conduit supports, other than for underground raceways, at no more than 8 foot intervals, and as required to obtain rigid construction.

F. Remove burrs and grind smooth sharp edges from channel support ends. Fit ends with plastic end caps.

3.3 CONCRETE BASES

A. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

B. Use 3000 psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Section 033000 "Cast-in-Place Concrete."

C. Anchor equipment to concrete base as follows:

1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
2. Install anchor bolts to elevations required for proper attachment to supported equipment.
3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.4 PAINTING

A. Touchup:

1. Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

    a. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

2. Comply with requirements in Section 099123 "Interior Painting" for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.

END OF SECTION 260529

All Rights Reserved

SECTION 260533.13 - CONDUITS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Conduits and fittings.

B. Products Installed, but Not Furnished, under This Section:

1. Section 260553 "Identification for Electrical Systems" for conduit identification labels.

C. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
3. Section 260533.16 “Boxes and Covers for Electrical Systems” for conduit bodies, outlet and device boxes, pull boxes, and junction boxes.
4. Section 260533.23 "Surface Raceways for Electrical Systems” for wireways and auxiliary gutters.
5. Section 260529 “Hangers and Supports for Electrical Systems” for channel support systems and miscellaneous mounting components.

1.3 DEFINITIONS

A. Conduit: A structure containing one or more duct raceways.

B. Duct Raceway: A single enclosed raceway for conductors or cable.

C. Duct Bank: An arrangement of conduit providing one or more continuous duct raceways between two points.

1.4 ACTION SUBMITTALS

A. Product Data: Manufacturer’s cut sheet for each type of product used on project. Note some conduit types listed may not be used on the project. Refer to the Conduit Selection Table in PART 3. Indicate in the submittal, the areas where specific materials are used. If multiple

manufacturers of a given type of conduit or fittings are proposed, submit those cut sheets rather than stating “or equal”.

B. Conduit Layouts: For all Divisions required under the project scope of work conduits installed underground and concealed within buildings and structures. Show equipment, boxes, handholes, manholes, routing, materials, and sizing. Provide layouts at an appropriate scale for clarity. Submission of separate drawings for power, lighting and control for one area is acceptable. Provide schedule for easy cross check.

PART 2 - PRODUCTS

2.1 PERFORMANCE CRITERIA

A. Regulatory Requirements: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2.2 TYPE ERMC-A DUCT RACEWAYS, ELBOWS, COUPLINGS, AND NIPPLES

A. Description: Rigid aluminum 6063 alloy conduit, elbows, couplings, and nipples per NEC Article 344.

B. Listing Criteria: UL DYWV - Rigid Nonferrous Metallic Conduit, including UL 6A.

C. Long radius elbows as indicated in Section 260543 “Underground Ducts and Raceways for Electrical Systems”.

D. PVC Coated Type: 40 mil PVC on exterior and 2 mil urethane on interior. (ERMC-A-PVC).

2.3 TYPE FMC DUCT RACEWAYS

A. Description: Flexible metal conduit per NEC Article 348.

B. Listing Criteria: UL DXUZ - Flexible Metal Conduit, including UL 1.

C. Material: Hot-dipped galvanize steel (FMC-S).

2.4 TYPE FMT DUCT RACEWAYS

A. Description: Flexible metal tubing composed of hot-dipped galvanized steel strips shaped into interlocking convolutions per NEC Article 360.

B. Listing Criteria: UL ILJW - Flexible Metallic Tubing, including UL 1652.

© 2026 CDM Smith
All Rights Reserved

2.5 TYPE LFMC DUCT RACEWAYS

A. Description: Liquidtight Flexible Metal Conduit, Type UA, per NEC Article 350.

B. Listing Criteria: UL DXHR – Liquid-tight Flexible Metal Conduit, including UL 360.

C. Material: Steel (LFMC-S).

D. Manufacturer: Sealtite®, Type UA, as manufactured by Anaconda, continuously interlocked flexible steel conduit with sunlight and chemical resistant PVC jacket.

2.6 FITTINGS FOR CONDUIT AND TUBING

A. General: Listed and labeled for type of conduit, location, and use.

1. ERMC-A: Use cast aluminum fittings.
2. ERMC-S: Use cast malleable iron fittings.

B. Listing Criteria as Applicable:

1. UL 514B – Conduit, Tubing, and Cable Fittings.
2. UL 1203 – Standard for Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.
3. UL DWTT – Conduit Fittings.
4. UL FKAV – Electrical Metallic Tubing Fittings.
5. UL ILNR – Flexible Metallic Tubing Fittings.
6. UL DXAS – Liquid-tight Flexible Metal Conduit Assemblies.

C. Refer to Section 260533.16 “Boxes and Covers for Electrical Systems” for conduit bodies such as LB’s, T’s, and C’s.

D. Metal Fittings:

1. EMT Fittings: Die cast, rain and concrete tight, compression type. Set screw type not permitted.
2. RMC Fittings: Threaded type. Threadless fittings and split couplings are not permitted.
3. FMC Fittings: Malleable iron, zinc plated, insulated throat.
4. Fittings for PVC Coated Conduit: Minimum 40 mil thick PVC coating, with overlapping sleeves of one pipe diameter in length to protect threaded joints.
5. LFMC Fittings: Three-piece screw in type, malleable iron.
6. Expansion Fittings: Include flexible external bonding jumper.
7. FMT Bushings: Insulated.
8. Grounding and Bonding Hubs, Bushings, and Hardware:

    a. Grounding Hub: Meyers type.
    b. Locknuts: Cast steel or aluminum.
    c. Bushings: Insulated throat with lay-in type lugs.

E. Nonmetallic Fittings:

1. PVC Fittings: Comply with NEMA TC 3 and match conduit material.

2. LFNC Fittings: Dust-tight, liquid-tight, chemical resistant thermoplastic/nylon construction with tapered thread hub and neoprene O-ring gasket. Push-on fittings are prohibited.

F. Specialty Fittings:

1. Explosionproof Sealing Fitting: Crouse-Hinds EYS or equal.
2. Explosionproof Flexible Coupling: Crouse-Hinds ECGJH or equal.
3. Deflection/Expansion Fitting: OZ-Gedney Type DX or equal.
4. Expansion Coupling: Crouse-Hinds Type XJG with bonding jumper or equal.
5. Conduit Sealing Bushings: Refer to Section 260544 “Sleeves and Sleeve Seals for Electrical Raceways and Cabling”.

2.7 ELECTRICALLY CONDUCTIVE CORROSION-RESISTANT COMPOUNDS FOR THREADED CONDUIT.

A. Description: Cold galvanizing compound, 95 percent zinc rich paint.

B. Listing Criteria: UL CCN FOIZ; including UL Subject 2419.

2.8 SOLVENT CEMENTS

A. Description: Solvent cement to join Type PVC duct raceways and fittings.

B. Listing Criteria: UL CCN DWTT; including UL 514B.

PART 3 - EXECUTION

3.1 SELECTION OF CONDUITS FOR ELECTRICAL SYSTEMS

A. Refer to Appendix Table 260533.13-1 for conduit application requirements.

B. Minimum Raceway Size: 3/4-inch trade size.

3.2 INSTALLATION OF CONDUITS FOR ELECTRICAL SYSTEMS

A. Comply with manufacturer's published instructions.

B. Reference Standards for Installation: Unless more stringent installation requirements are specified in Contract Documents or manufacturers' published instructions, comply with the following as applicable:

1. Relevant Article of NFPA 70.
2. NECA NEIS 101 – Standard for Installing Steel Conduits.
3. NECA NEIS 102 – Standard for Installing Aluminum Rigid Metal Conduit.
4. NECA NEIS 111 – Standard for Installing Nonmetallic Raceways.

5. NEMA FB 2.10 – Selection and Installation Guidelines for Fittings for Use with Non-Flexible Metallic Conduit or Tubing.
6. NEMA FB 2.20 – Selection and Installation Guidelines for Fittings for Use with Flexible Electrical Conduit and Cable.
7. NEMA FB 2.40 – Installation Guidelines for Expansion and Expansion/Deflection Fittings.

C. Special Installation Techniques:

1. General Requirements for Installation of Duct Raceways:

a. Complete duct raceway installation before starting conductor installation.
b. Underground Installations: Refer to additional requirements in Section 260543 “Underground Ducts and Raceways for Electrical Systems”.
c. Provide stub-ups through floors with coupling threaded inside for plugs, set flush with finished floor. Plug coupling until conduit is extended above floor to final destination or a minimum of 2 feet above finished floor.
d. Coordinate stub-up locations with approved shop drawings for equipment to position stub-up directly below appropriate section of motor control center, switchboard, or switchgear.
e. Provide a 4 inch thick concrete housekeeping pad at slab and grade penetrations. Provide a 45 degree, 3/4 inch chamfer at exposed edges.
f. Install no more than equivalent of three 90-degree bends in conduit run. Support within 12 inches of changes in direction.
g. Maximum continuous conduit run: 300 feet. Reduce distance by 75 feet for each 90-degree elbow.
h. Make bends in duct raceway using large-radius preformed ells except for parallel bends. Field bending must be in accordance with NFPA 70 minimum radii requirements. Provide only equipment specifically designed for material and size involved.
i. Conceal conduit within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.
j. Support conduit within 12 inches of enclosures to which attached.
k. Drainage: Arrange conduit system to allow liquids such as water, condensation, etc. to drain away from equipment served. If conduit drainage is not possible, plug conduits using conduit seals.
l. Hazardous Areas: Install duct sealing fittings at accessible locations in accordance with NFPA 70 and fill them with listed sealing compound. For concealed duct raceways, install fitting in flush steel box with blank cover plate having finish similar to that of adjacent plates or surfaces. Install duct sealing fittings in accordance with NFPA 70.
m. Moisture Control: Install devices to seal duct raceway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal interior of duct raceways using “Polywater” FST-250 Foam Duct Sealant or seal fitting at the following points:

1) Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
2) Where an underground service duct raceway enters a building or structure.
3) Conduit extending from interior to exterior of building.
4) Conduit extending into pressurized duct raceway and equipment.

5) Conduit extending into pressurized zones that are automatically controlled to maintain different pressure set points.
6) Where otherwise required by NFPA 70.

n. Do not install duct raceways or electrical items on "explosion-relief" walls or rotating equipment.
o. Do not install conduits within 2 inches of the bottom side of a metal deck roof.
p. Keep duct raceways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal duct raceway runs above water and steam piping.
q. Cut conduit perpendicular to the length. For conduits trade size 2 and larger, use roll cutter or a guide to make cut straight and perpendicular to the length. Ream inside of conduit to remove burrs.
r. Install pull wires in empty duct raceways. Provide polypropylene or monofilament plastic line with not less than 200 lb tensile strength. Leave at least 12 inches of slack at both ends of pull wire. Cap underground duct raceways designated as spare above grade alongside duct raceways in use. Use threaded cap.
s. Install duct raceways square to the enclosure and terminate at enclosures without hubs with locknuts on both sides of enclosure wall. Install locknuts hand tight, plus one-quarter turn more.
t. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install bushings on conduits up to trade size 1-1/4 and insulated throat metal bushings on trade size 1-1/2 and larger conduits terminated with locknuts. Install insulated throat metal grounding bushings on service conduits. Install Meyers grounding type hubs when conduits terminate at NEMA 3R, 4, and 4X gasketed enclosures.

2. Do not install aluminum duct raceways or fittings in contact with concrete or earth.
3. Protect metallic finish conduit installed in contact with concrete or below grade use PVC coated steel or aluminum where required, heat shrink tubing, or approved equivalent. Provide protection from 12 inches below bottom of concrete to not less than 6 inches above surface of concrete.
4. Rigid Metal Conduit (Type ERMC):

a. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound that maintains electrical conductivity to threads of duct raceway and fittings before making up joints. Follow compound manufacturer's published instructions.
b. The use of running threads is prohibited. Where such threads are necessary, use a three piece union.

5. PVC Coated Rigid Metal Conduit (Type ERMC-A-PVC and ERMC-S-PVC):

a. Follow manufacturer's installation instructions for clamping, cutting, threading, bending, and assembly.
b. Provide PVC-coated sealing locknut for exposed male threads transitioning into female NPT threads that do not have sealing sleeves, including transitions from PVC couplings/female adapters to PVC-coated ERMC elbows in direct-burial applications. PVC-coated sealing locknuts must not be used in place of conduit hub. PVC-coated sealing locknut must cover exposed threads on PVC-coated ERMC duct raceway.

c. Coat field-cut threads on PVC-coated duct raceway with manufacturer-approved corrosion-preventing conductive compound prior to assembly.

6. Flexible Conduit Connections (Types FMC, LFMC, and LFNC):

a. Provide a maximum of 72 inches of flexible conduit for recessed and semirecessed luminaires, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
b. Include adequate slack to allow for thermal expansion and mechanical vibration.
c. Orient outdoor flexible connections to provide drip loop to avoid accumulation of water at equipment connection points.

7. Non-Metallic Conduit (Type PVC):

a. Do not install Type PVC conduit where ambient temperature exceeds 122 degrees F. Conductor ratings must be limited to 75 degrees C except where installed in a trench outside buildings with concrete encasement, where 90 degrees C conductors are permitted.
b. Comply with manufacturer's published instructions for solvent welding and fittings.

8. Duct Raceways Embedded in Slabs:

a. Comply with spacing requirements as noted on Structural Drawings.
b. Arrange duct raceways to cross building expansion joints with expansion fittings at right angles to the joint.
c. Arrange duct raceways to ensure that each is surrounded by minimum of 1 inch of concrete without voids.

9. Stub-ups at Slabs: Arrange stub-ups so curved portions of bends are not visible above finished slab.

10. Stub-ups to Above Recessed Ceilings:

a. Provide EMT or ERMC for duct raceways.
b. Provide a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.

11. Duct Raceway Terminations at Locations Subject to Moisture or Vibration:

a. Provide insulating bushings to protect conductors, including conductors smaller than 4 AWG..

12. Duct Fittings: Use only fittings listed for use with each type of tubing or conduit and in accordance with specific fittings listed under PART 2.

a. ERMC-A-PVC: Patch and seal joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Provide sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.

13. Expansion-Joint Fittings: Install where necessary to compensate for thermal expansion and contraction and wherever conduits cross building or structure expansion joints.

14. Duct Raceways Penetrating Rooms or Walls with Acoustical Requirements: Seal duct raceway openings on both sides of rooms or walls with acoustically rated putty.
15. Identification: Install identification tags at conduits in accordance with Section 260553 “Identification for Electrical Systems”.

D. Interfaces with Other Work:

1. Coordinate installation with other trades in advance of installation.
2. Restore walls, floor, and roof to original condition such as watertight, fire rating, smooth and/or painted finish after duct raceway penetration.
3. Coordinate with Section 260529 "Hangers and Supports for Electrical Systems" for installation of conduit hangers and supports.

3.3 PROTECTION

A. Protect coatings, finishes, and cabinets from damage and deterioration.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

3.4 ATTACHMENTS

A. Table 260533.13-1: Conduit Selection Guidelines

Table 260533.13-1
Conduit Selection Guidelines

Raceway Type	Location / Application
EMT	Indoor air conditioned spaces in Administration / Office buildings including electrical rooms, mechanical rooms, control rooms, toilets, and offices.
ERMC-A	Indoor and outdoor applications, except where other types are listed. Exposed, non-corrosive areas. Concealed, non-corrosive areas. Under slabs in slab on grade construction / stub-ups. When installed underground or in contact with concrete, paint with two coats of bitumastic paint or use ERMC-A-PVC.
ERMC-A-PVC	Allowed for use in lieu of painting ERMC-A with two coats of bitumastic paint.
ERMC-S	Not used on this project.
ERMC-S-PVC	Not used on this project.
FMC	Flexible connections used in conjunction with EMT.

Table 260533.13-1 Conduit Selection Guidelines	
Raceway Type	Location / Application
FMT	Flexible connections to light fixtures in conjunction with EMT.
LFMC	Flexible connections used in conjunction with ERMC types.
LFNC-B	Flexible connections used in designated corrosive areas. Limited to 2-inch trade size.
PVC-40	Concrete encased duct banks. Embedded in concrete slabs or structures. Underground elbows are to be ERMC type.
PVC-80	Direct buried. Areas designated as corrosive. Protection of grounding electrode conductors. Protection of lightning conductors. Underground elbows are to be ERMC type.

SECTION 260533.16 - BOXES AND COVERS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Conduit bodies.
2. Metallic outlet boxes, device boxes, rings, and covers.
3. Nonmetallic outlet boxes, device boxes, rings, and covers.
4. Junction boxes and pull boxes.
5. Cover plates for device boxes.
6. Hoods for outlet boxes.

B. Products Installed, but Not Furnished, under This Section:

1. See Section 260553 "Identification for Electrical Systems" for electrical equipment labels.

C. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product used on the project.

PART 2 - PRODUCTS

2.1 PERFORMANCE CRITERIA

A. Regulatory Requirements: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

B. Listing Criteria as Applicable:

1. UL 514A – Metallic Outlet Boxes.
2. UL 514B – Conduit, Tubing, and Cable Fittings.
3. UL 514C – Standard for Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers.
4. UL 514D – Cover Plates for Flush-Mounted Wiring Devices.
5. UL BGUZ – Junction and Pull Boxes.
6. UL QCIT – Metallic Outlet Boxes.
7. UL QCMZ – Nonmetallic Outlet Boxes.

2.2 CONDUIT BODIES

A. Description: Means for providing access to interior of conduit or tubing system through one or more removable covers at junction or terminal point.

B. Listed and labeled for type of conduit, location, and use. Refer to Section 260533.13 “Conduits for Electrical Systems” for conduit types and fittings used on the project.

C. Use mogul type (with rollers) for metal conduit bodies sizes 2-1/2 inch and larger by Appleton Electric.

2.3 METALLIC OUTLET BOXES, DEVICE BOXES, RINGS, AND COVERS

A. Outlet and Device Box Description: Box having pry out openings, knockouts, threaded entries, or hubs in either the sides of the back, or both, for entrance of conduit, conduit or cable fittings, or cables, with provisions for mounting outlet box cover.

1. Outlet boxes do not include provisions to mount devices.
2. Device boxes include provisions to mount a device to the box.

B. Extension Ring Description: Ring intended to extend sides of outlet box or device box to increase box depth, volume, or both.

C. Pressed Steel Boxes: Hot dipped galvanized with hot-dipped galvanized tile rings. For use when recessed in walls or indoors exposed in non-process ceiling areas.

1. Lighting outlet boxes: 4-11/16 inch square, 2 1/8 inch deep, minimum.
2. Device boxes with electronics device (i.e. smart switch or receptacle, occupancy sensor, dimmer, etc.): Largest size for number of gangs required.

D. Cast Boxes: Type FD (deep) only. Type FS not permitted. Copper free aluminum. PVC coated when used with PVC coated conduits. Gasketed cover when used outdoors. Stainless steel screws for covers.

E. Explosionproof Type Box for Class 1, Division 1 Areas: Copper free aluminum. PVC coated when used with PVC coated conduits. Internal ground screw and O-ring. Pry notches on cover for bar or wrench.

F. Pedestal Device Boxes: Cast aluminum, polished finished. Used for laboratory bench receptacles.

G. Floor Boxes: Concrete tight. Number and type of devices as indicated on Drawings.

2.4 NONMETALLIC OUTLET BOXES, DEVICE BOXES, RINGS, AND COVERS

A. Outlet and Device Box Description: Box having pry out openings, knockouts, threaded entries, or hubs in either the sides of the back, or both, for entrance of conduit, conduit or cable fittings, or cables, with provisions for mounting outlet box cover.

1. Outlet boxes do not include provisions to mount devices.
2. Device boxes include provisions to mount a device to the box.

B. Only allowed in conjunction with PVC schedule 80 exposed conduit installations.

C. Type FD (deep) box only. Type FS (shallow) box not allowed.

2.5 JUNCTION BOXES AND PULL BOXES

A. Description: Box with a blank cover that serves the purpose of joining different runs of raceway or cable. Boxes that contain terminals, relays, surge protective devices, or devices mounted on the cover are specified under Section 262716 “Electrical Cabinets and Enclosures”.

B. NEMA 12 Junction and Pull Boxes:

1. Material: Sheet steel, minimum 14 gauge, without knockouts.
2. Construction: Flanged box, galvanized with continuous weld seams that are ground smooth.
3. Cover: Gasketed, hinged, fastened with quick connect door clamp.

C. NEMA 4X/SS Junction and Pull Boxes:

1. Material: Type 316 stainless steel, minimum 14 gauge, without knockouts.
2. Construction: Flanged box, continuous weld seams that are ground smooth.
3. Cover: Gasketed, hinged, fastened with quick connect door clamp.

D. NEMA 4X/FRP Chemical Area Junction and Pull Boxes: When Drawings classify the area as CORROSIVE, ultraviolet resistant fiberglass reinforced plastic (FRP) with stainless steel hardware and gasketed covers.

E. NEMA 6/6P Junction and Pull Boxes: When Drawings call out for NEMA 6 (temporary submersion at limited depth) or NEMA 6P (prolonged submersion at limited depth), die cast aluminum or nonmetallic, coordinated with conduit material.

F. NEMA 7/4 Junction and Pull Boxes: When Drawings classify the area for Class 1, Division 1, Group D hazardous area, cast aluminum, cover gasket to meet NEMA 4 requirements, stainless steel hinged cover, stainless steel bolts. Crouse-Hinds Type EJB or equal.

2.6 COVER PLATES FOR DEVICES BOXES

A. Single Source: Obtain wall plates from same manufacturer of wiring device. Refer to Section 262726 “Wiring Devices” for requirements.

B. Single and combination types to match corresponding wiring devices.

1. Plate-Securing Screws: Metal with head color to match plate finish.
2. Material for Flush Mounted Devices in Indoor Administrative Spaces: Includes offices, conference rooms, break rooms, restrooms, and control rooms.
3. Smooth, high impact thermoplastic or nylon, color to match wiring device.
4. Material for Flush Mounted Devices in Indoor Industrial Spaces: Includes electrical rooms, mechanical rooms, janitor closets, and indoor process areas. Type 302 (18-8) high nickel stainless steel.
5. Material for Surface Mounted Devices: Match box material.

2.7 HOODS FOR OUTLET BOXES

A. Description: Hood to mount to box for to create weatherproof while in use condition.

B. Wet-Location, Weatherproof Cover Plates (Hoods) for Switches and Receptacles: NEMA 250, complying with Type 3R, in-use weather-resistance, die-cast aluminum with lockable cover.

PART 3 - EXECUTION

3.1 SELECTION OF BOXES AND COVERS FOR ELECTRICAL SYSTEMS

A. Unless more stringent requirements are specified in Contract Documents or manufacturers' published instructions, comply with NFPA 70 for selection of boxes and enclosures. Consult Engineer for resolution of conflicting requirements.

B. Conduit bodies: Match associated conduit type.

C. Outlet boxes recessed in walls or indoors exposed in non-process ceiling areas: Pressed steel.

D. Exposed outlet and device boxes: Cast metal except where PVC-80 is used. Use PVC coated cast metal when conduit is PVC coated. Use non-metallic when PVC-80 is used.

E. Junction and pull boxes: Suitable for the location and conform to the NEMA enclosure ratings and material descriptions included on Drawings. Where no size is indicated, size in accordance with NEC Article 314.

3.2 INSTALLATION OF BOXES AND COVERS FOR ELECTRICAL SYSTEMS

A. Comply with manufacturer's published instructions.

B. Special Installation Techniques:

1. Provide boxes in wiring and raceway systems wherever required for pulling of wires, making connections, and mounting of devices or fixtures.
2. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.
3. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall and the bottom or top of box should be placed at mortar joint. Prepare block surfaces to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box, whether installed indoors or outdoors.
4. Horizontally separate boxes mounted on opposite sides of walls so they are not in the same vertical channel.
5. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for purpose.
6. Fasten junction and pull boxes to, or support from, building structure. Do not support boxes by conduits.
7. Set metal floor boxes level and flush with finished floor surface.
8. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.
9. Do not install aluminum boxes, enclosures, or fittings in contact with concrete or earth.
10. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to ensure a continuous ground path.
11. Boxes and Enclosures in Areas or Walls with Acoustical Requirements:

    a. Seal openings and knockouts in back and sides of boxes and enclosures with acoustically rated putty.
    b. Provide gaskets for wallplates and covers.

12. Identification: Install labels and nameplates in accordance with Section 260553 “Identification for Electrical Systems”.

3.3 CLEANING

A. Remove construction dust and debris from boxes before installing wallplates, covers, and hoods.

3.4 PROTECTION

A. After installation, protect boxes from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

SECTION 260533.23 - SURFACE RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Surface type raceways including wireways and troughs and auxiliary gutters.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: Manufacturer’s cut sheet for each type of product used on project.

PART 2 - PRODUCTS

2.1 PERFORMANCE CRITERIA

A. Regulatory Requirements: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

B. Listing Criteria as Applicable:

1. UL 94 – Standard for Tests for Flammability of Plastic Materials for Parts in Devices and Appliances.
2. UL 870 – Standard for Wireways, Auxiliary Gutters, and Associated Fittings.
3. UL CCN ZOYX – Wireway, Auxiliary Gutters and Associated Fittings.

2.2 WIREWAYS AND AUXILIARY GUTTERS

A. Metallic:

1. NEMA 12 Type: Painted steel, gasketed, hinged cover, stainless steel hardware. Square Duct as manufactured by Schneider Electric or equal.
2. NEMA 4X/SS Type: Stainless steel, Type 304, gasketed, hinged and clamped cover with drip lip, stainless steel hardware. Hoffman Bulletin F22 by nVent.

B. Nonmetallic:

1. NEMA 3R/FRP Type: Fiberglass, gasketed, hinged cover, stainless steel hardware. Hoffman Fiberglass Hinged-Cover Wiring Trough by nVent.

PART 3 - EXECUTION

3.1 INSTALLATION OF SURFACE RACEWAYS FOR ELECTRICAL SYSTEMS

A. Comply with manufacturer's published instructions.

B. Reference Standards for Installation: Unless more stringent installation requirements are specified in Contract Documents or manufacturers' published instructions, comply with the following:

1. Auxiliary Gutters: Article 366 of NFPA 70.
2. Metal Wireways: Article 376 of NFPA 70.

C. Special Installation Techniques:

1. Install surface raceways or wireways and gutters as indicated on Drawings or when approved by Engineer.

3.2 CLEANING

A. Remove construction dust and debris from surface raceways before installing wires and again when installing covers.

3.3 PROTECTION

A. After installation, protect surface raceways from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

SECTION 260544 - SLEEVES AND SLEEVE SEALS FOR ELECTRICAL RACEWAYS AND CABLING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Round sleeves.
2. Rectangular sleeves.
3. Conduit sealing bushings.
4. Sleeve-seal systems.
5. Sleeve-seal fittings.
6. Grout.
7. Pourable sealants.
8. Foam sealants.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
3. Section 078413 "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

PART 2 - PRODUCTS

2.1 ROUND SLEEVES

A. Steel Wall Sleeves:

1. General Characteristics: ASTM A53/A53M, Type E, Grade B, Schedule 40, zinc coated, plain ends and integral waterstop.

B. Cast-Iron Wall Sleeves:

1. General Characteristics: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral double waterstop. OZ-Gedney type WSK Thru Wall Floor Seal or equal for new installations with poured concrete.

C. PVC Molded Sleeves:General Characteristics: With nailing flange for attaching to wooden forms.

1. PE or PP Molded

D. Sleeves:

1. General Characteristics: Removable, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

E. Round, Galvanized-Steel, Sheet Metal Sleeves:

1. General Characteristics: Galvanized-steel sheet; thickness not less than 0.0239 inch; round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.

2.2 RECTANGULAR SLEEVES

A. Rectangular, Galvanized-Steel, Sheet Metal Sleeves:

1. General Characteristics:

a. Material: Galvanized sheet steel.
b. Minimum Metal Thickness:

1) For sleeve cross-section rectangle perimeter less than 50 inches and with no side larger than 16 inches, thickness is to be 0.052 inch.
2) For sleeve cross-section rectangle perimeter not less than 50 inches or with one or more sides larger than 16 inches, thickness is to be 0.138 inch.

2.3 CONDUIT SEALING BUSHINGS

A. General Characteristics: Malleable iron collar, one piece neoprene sealing ring, stainless steel hardware, designed for field assembly, to prevent passage of fluids and gases as conduits pass through walls and function as a sleeve-seal system. Rated for Class 1, Division 2 locations. OZ-Gedney CSB Series or CSM Series, or equal, depending upon application.

2.4 SLEEVE-SEAL SYSTEMS

A. General Characteristics: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable or between raceway and cable.

B. Options:

1. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
2. Pressure Plates: Stainless steel.
3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.5 SLEEVE-SEAL FITTINGS

A. General Characteristics: Manufactured plastic, sleeve-type, waterstop assembly made for embedding in concrete slab or wall. Unit must have plastic or rubber waterstop collar with center opening to match piping OD.

2.6 GROUT

A. General Characteristics: Nonshrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.

1. Standard: ASTM C1107/C1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
2. Design Mix: 5000 psi, 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

2.7 POURABLE SEALANTS

A. Performance Criteria:

1. General Characteristics: Single-component, neutral-curing elastomeric sealants of grade indicated below.

a. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.

2.8 FOAM SEALANTS

A. Performance Criteria:

1. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam. Foam expansion cannot damage cables or crack penetrated structure.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 INSTALLATION OF SLEEVES FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

A. Sleeves for Conduits Penetrating Above-Grade, Non-Fire-Rated, Concrete and Masonry-Unit Floors and Walls:

1. Interior Penetrations of Non-Fire-Rated Walls and Floors:

   a. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall or floor so no voids remain. Tool exposed surfaces smooth; protect material while curing.
   b. Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Section 079200 "Joint Sealants."

2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
3. Size pipe sleeves to provide 1/4 inch annular clear space between sleeve and raceway or cable, unless sleeve-seal system is to be installed .
4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inches above finished floor level. Install sleeves during erection of floors.

B. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Wall Assemblies:

1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
2. Seal space outside of sleeves with approved joint compound for gypsum board assemblies.

C. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.

D. Aboveground, Exterior-Wall Penetrations: Seal penetrations using cast-iron pipe sleeves and mechanical sleeve-seal systems. Size sleeves to allow for 1 inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

E. Underground, Exterior-Wall and Floor Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing sleeve-seal system.

3.2 INSTALLATION OF RECTANGULAR SLEEVES AND SLEEVE SEALS

A. Install sleeves in existing walls without compromising structural integrity of walls. Do not cut structural elements without reinforcing the wall to maintain the designed weight bearing and wall stiffness.

B. Install conduits and cable with no crossings within the sleeve.

C. Fill opening around conduits and cables with expanding foam without leaving voids.

D. Provide metal sheet covering at both wall surfaces and finish to match surrounding surfaces. Metal sheet must be same material as sleeve.

3.3 INSTALLATION OF CONDUIT SEALING BUSHINGS

A. Install where a sleeve-seal system or seal-fitting installation is required in an NEC Class 1, Division 2 hazardous location.

3.4 INSTALLATION OF SLEEVE-SEAL SYSTEMS

A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.

B. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.5 SLEEVE-SEAL-FITTING INSTALLATION

A. Install sleeve-seal fittings in new walls and slabs as they are constructed.

B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.

C. Secure nailing flanges to concrete forms.

D. Using grout, seal the space around outside of sleeve-seal fittings.

SECTION 260548 - VIBRATION AND SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Elastomeric isolation pads.
2. Restraints - rigid type.
3. Restraints - cable type.
4. Restraint accessories.
5. Post-installed concrete anchors.
6. Concrete inserts.

B. Not all components specified in this Section are necessarily utilized on this project. Verify components needed per Drawings and Specifications.

C. Related Requirements:

1. Section 018829 “Seismic Performance Requirements” for submittals, performance requirements and installation.
2. Section 018839 “Wind Performance Requirements” for submittals, performance requirements and installation.
3. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definition, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
4. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
5. Section 260529 "Hangers and Supports for Electrical Systems" for commonly used electrical supports and installation requirements.

PART 2 - PRODUCTS

2.1 ELASTOMERIC ISOLATION PADS

A. Elastomeric Isolation Pads: .

1. Fabrication: Single or multiple layers of sufficient durometer stiffness for uniform loading over pad area.

2. Size: Factory or field cut to match requirements of supported equipment.
3. Pad Material: Oil and water resistant with elastomeric properties. Neoprene rubber, silicone rubber, or other elastomeric material.
4. Surface Pattern: Smooth, ribbed, or waffle pattern.

2.2 RESTRAINTS - RIGID TYPE

A. Description: Shop- or field-fabricated bracing assembly made of ANSI/AISI S110-07-S1 slotted steel channels, ANSI/ASTM A53/A53M steel pipe, or other rigid steel brace member. Includes accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.3 RESTRAINTS - CABLE TYPE

A. Seismic- and Wind-Load-Restraint Cables: ASTM A492 stainless steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for seismic-restraining cable service; with fittings attached by means of poured socket, swaged socket, or mechanical (Flemish eye) loop.

B. Restraint cable assembly and cable fittings must comply with ASCE/SEI 19. Cable fittings and complete cable assembly must maintain the minimum cable breaking force. U-shaped cable clips and wedge-type end fittings do not comply and are unacceptable.

2.4 RESTRAINT ACCESSORIES

A. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod. Non-metallic stiffeners are unacceptable.

B. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

C. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

D. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

E. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.5 POST-INSTALLED CONCRETE ANCHORS

A. Mechanical Anchor Bolts:

1. Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength for anchor and as tested according to ASTM E488/E488M.

B. Adhesive Anchor Bolts:

1. Drilled-in and capsule anchor system containing PVC or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488/E488M.

C. Provide post-installed concrete anchors that have been prequalified for use in seismic and wind-load applications.

1. Prequalify post-installed anchors in concrete in accordance with ACI 355.2 or other approved qualification testing procedures.
2. Prequalify post-installed anchors in masonry in accordance with approved qualification procedures.

D. Expansion-type anchor bolts are not permitted for equipment in excess of 10 hp that is not vibration isolated.

1. Undercut expansion anchors are permitted.

2.6 CONCRETE INSERTS

A. Provide preset concrete inserts that are seismically prequalified in accordance with ICC-ES AC446 testing.

B. Comply with MSS SP-58.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install seismic and/or wind restraint components in accordance with Division 01 requirements.

SECTION 260553 - IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Identification products along with color and legend requirements.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
3. Section 260573 “Power System Studies” for arc flash study labels.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Note that not all products listed may be utilized on this project.

B. Identification Schedule: For each piece of electrical equipment and electrical system components to be index of nomenclature for electrical equipment and system components used in identification signs and labels. Use same designations indicated on Drawings.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Comply with ASME A13.1 and IEEE C2.

B. Comply with 29 CFR 1910.144 for color identification of hazards; 29 CFR 1910.145 for danger, caution, warning, and safety instruction signs and tags; and the following where applicable:

1. Ceiling-mounted hangers, supports, cable trays, and raceways must be finished, painted, or suitably marked safety yellow where less than 7.7 feet above finished floor.

C. Signs, labels, and tags required for personnel safety must comply with the following standards:

1. Safety Colors: NEMA Z535.1.
2. Facility Safety Signs: NEMA Z535.2.
3. Safety Symbols: NEMA Z535.3.
4. Product Safety Signs and Labels: NEMA Z535.4.
5. Safety Tags and Barricade Tapes for Temporary Hazards: NEMA Z535.5.

D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 degrees F, ambient; 180 degrees F, material surfaces.

2.2 COLOR AND LEGEND REQUIREMENTS

A. Color-Coding for Phase- and Voltage-Level Identification, 1000 V or Less: Use colors listed for conductors.

1. Color must be factory applied or field applied for sizes larger than 8 AWG.
2. Colors for 208Y/120 V Circuits:

a. Phase A: Black.
b. Phase B: Red.
c. Phase C: Blue.
d. Neutral: White.

3. Colors for 240/120 V Circuits (Single Phase):

a. Phase A: Black.
b. Phase B: Red.
c. Neutral: White.

4. Colors for 240Δ/120 V Circuits (Three Phase, Four Wire, High Leg, Center Tap):

a. Phase A: Black.
b. Phase B: Orange (high leg).
c. Phase C: Blue.
d. Neutral: White.

5. Colors for 480Y/277 V Circuits:

a. Phase A: Brown.
b. Phase B: Orange.
c. Phase C: Yellow.
d. Neutral: Gray.

6. Colors for DC Circuits:

a. Positive: Red.
b. Negative: Black.

7. Color for Equipment Grounding Conductors: Green.

B. Color-Coding for Phase- and Voltage-Level Identification, Over 1000 V: Use double colors listed for conductors.

1. Colors for 5 kV Rated Circuits:

a. Phase A: Black/Red.
b. Phase B: Red/Red.
c. Phase C: Blue/Red.

2. Colors for 15 kV Rated Circuits:

a. Phase A: Brown/Red.
b. Phase B: Orange/Red.
c. Phase C: Yellow/Red.

3. Color for Equipment Grounding Conductor (600V rated): Green.

C. Warning Label Colors:

1. Identify system voltage with black letters on orange background.

D. Warning labels and nameplates/signs must include, but are not limited to, the following legends:

1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."

E. Equipment Identification and Source Nameplate:

1. Color: Black letters on a white field.
2. Material: See NAMEPLATES Article.
3. Equipment furnished under Divisions 26, 27, 28 and equipment control panels furnished under other Divisions must include equipment identification nameplates. Equipment includes, but is not limited to switchgear, switchboards, motor control centers, panelboards, transformers, disconnect switches, separately mounted motor controllers, transfer switches, control panels, and named enclosures or cabinets. Nameplate to match designation indicated on Drawings.
4. Power source must be identified at all applicable equipment. Nameplate may be separate from identification nameplate or information may be contained on one nameplate. For example, a local disconnect switch for a pump motor could have one nameplate reading “EFFLUENT PUMP NO. 4” for the identification nameplate and a second nameplate reading “FED FROM MCC-2”. Or a two-line nameplate combining the information for both identification and source.

F. Device Identification Labels:

1. Color: Black letters on a white field. In office areas only, black letters on a clear field.
2. Material: Self-adhesive type, machine generated, 1/4 inch high letters.
3. Devices to be labeled with panel and branch circuit number include receptacles, wall switches, lighting fixtures, photocells, emergency lights, exit lights, instruments, etc. For

example, a light switch powered from panelboard LP-2 and branch circuit 4 would have the label “LP-2/4” or “LP-2/CKT 4”.

2.3 NAMEPLATES

A. Material:

1. Engraved, engraved plastic (lamicoid).
2. Minimum size: Not less than 1/16 inch thick by 3/4 inch high by 2-1/2 inches wide.
3. Lettering: Upper case, 3/16 inch high minimum.

2.4 LABELS, BANDS, TUBES, AND SLEEVES

A. Self-Adhesive Labels: Polyester or Vinyl, thermal, transfer-printed, 3 mil thick, multicolor, weather- and UV-resistant, pressure-sensitive adhesive labels, configured for intended use and location.

B. Heat-Shrink Preprinted Tubes (Sleeve Type): Flame-retardant polyolefin tubes with machine-printed identification labels, sized to suit diameter and shrunk to fit firmly. Full shrink recovery occurs at maximum of 200 degrees F. Comply with UL 224. Printed text is black, permanent, and waterproof.

2.5 TAPES

A. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.

B. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; not less than 3 mil thick by 1 to 2 inches wide; compounded for outdoor use.

C. Underground-Line Warning Tape:

1. Tape:

a. Recommended by manufacturer for method of installation and suitable to identify and locate underground electrical and communications utility lines.
b. Printing on tape must be permanent and may not be damaged by burial operations.
c. Tape material and ink must be chemically inert and not be subject to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.

2. Color and Printing:

a. Comply with APWA Uniform Color Code using NEMA Z535.1 safety colors.
b. Inscriptions for Red Tapes: "CAUTION BURIED ELECTRIC LINE BELOW".
c. Inscriptions for Orange Tapes: "CAUTION BURIED COMMUNICATION LINE BELOW".

3. Detectable Tape:

a. Detectable three-layer laminate, consisting of printed pigmented polyolefin film, solid aluminum-foil core, and clear protective film that allows inspection of continuity of conductive core; bright colored, continuous-printed on one side with inscription of utility, compounded for direct-burial service.
b. Width: 6 inches.
c. Overall Thickness: 5 mil.
d. Foil Core Thickness: 0.35 mil.

2.6 TAGS

A. Metal Tags: Embossed, Type 316 stainless steel, 0.01 inch thick, punched for use with tie fastener. Secure with 0.048 inch diameter stainless steel band fastened with compression wire clamps

B. Nonmetallic Preprinted Tags: Polyester or Polyethylene tags, 0.015 inch thick, color-coded for phase and voltage level, with factory screened permanent designations; punched for use with self-locking cable tie fastener.

2.7 CABLE TIES

A. UV-Stabilized Cable Ties: Fungus inert, designed for continuous exposure to exterior sunlight, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

1. Minimum Width: 3/16 inch.
2. Tensile Strength at 73 degrees F in accordance with ASTM D638: 12,000 psi.
3. Temperature Range: Minus 40 to plus 185 degrees F.
4. Color: Black.

2.8 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Paint: Comply with requirements in painting Sections for paint materials and application requirements. Retain paint system applicable for surface material and location (exterior or interior).

B. Fasteners for Labels and Nameplates/Signs: Self-tapping, stainless steel screws or stainless steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.1 PREPARATION

A. Self-Adhesive Identification Products: Before applying electrical identification products, clean substrates of substances that could impair bond, using materials and methods recommended by manufacturer of identification product.

© 2026 CDM Smith
All Rights Reserved

3.2 SELECTION OF IDENTIFICATION PRODUCTS

A. Power-Circuit Conductor Identification, 1000 V or Less: For conductors at termination points and in vaults, pull and junction boxes, manholes, and handholes, use self-adhesive vinyl tape if conductor is not factory colored to identify phase, neutral, and ground conductors. Use heat-shrink to identify circuit.

B. Power-Circuit Conductor Identification, More Than 1000 V: For conductors at termination points and in vaults, pull and junction boxes, manholes, and handholes, use heat-shrink. Use nameplate or nonmetallic tag secured with cable ties to indicate phase and indicate circuit designation.

C. Control-Circuit Conductor Identification: For conductors and cables in pull and junction boxes, manholes, and handholes, use self-adhesive labels with conductor or cable designation, origin, and destination.

D. Control-Circuit Conductor Termination Identification: For identification at terminations, provide heat-shrink preprinted tubes with conductor designation.

E. Spare Conductors or Cables: Attach nonmetallic tags or self-adhesive labels to conductors and list source.

F. SCADA Systems, Communication Systems, Fire Alarm Systems or Other Auxiliary Electrical Systems Conductor Identification: For identification at terminations, provide heat-shrink preprinted tubes with conductor designation.

G. Conduit Identification: For designated identification as indicated on Drawings provide metal tags.

H. Pull Boxes and Junction Boxes, 24 inches by 24 inches and Larger: For voltage identification provide nameplates using 1 inch high minimum letters, white letters on red background.

I. Equipment Identification: For identification and source information provide nameplate(s) per COLOR AND LEGEND REQUIREMENTS Article.

J. Device Identification: For source and circuit information provide self-adhesive label per COLOR AND LEGEND REQUIREMENTS Article.

3.3 INSTALLATION

A. Install identification product in accordance with manufacturer’s instructions.

B. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and operation and maintenance manual. Use consistent designations throughout Project.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

D. Verify identity of item before installing identification products.

E. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and operation and maintenance manual.

F. Apply identification devices to surfaces that require finish after completing finish work.

G. Apply wire markers so entire designation is clearly visible.

H. Install Arc Flash Labels in accordance with Section 250573 “Power System Studies”.

I. Identify the system voltage (e.g. 208/120 VOLTS, 480 VOLTS, 4160 VOLTS) at the covers of large pull boxes or junction boxes.

J. Install field device (instruments, receptacles, switches, etc.) labels.

K. Install equipment nameplates. Nameplate fastening requirements:

1. NEMA 12 Enclosures: Screw mounted using stainless steel screws.
2. Other Enclosure Types: Bonded using epoxy or similar permanent waterproof adhesive. Two sided foam adhesive tape is not acceptable.

L. Panelboard and Transformer Panel Assembly Identification:

1. Provide equipment identification nameplates as previously described.
2. Label branch circuit phase and neutral wires with associated pole number using self-adhesive labels or type written sleeve type labels.
3. Install typed as built circuit directory listing with unique load identification.

M. Install Tags. Fastening Requirements:

1. Secure metal tags using stainless steel ties.
2. Secure nonmetallic tags with UV-stabilized cable ties.

SECTION 260573 - POWER SYSTEM STUDIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes a computer-based study for:

1. Short circuit report.
2. Protective device coordination report.
3. Motor starting report.
4. Arc flash report.

B. Study encompasses the power distribution system of the Cedar Creek Water Pollution Control Plant. Facility is located at 3340 Merrick Rd, Wantagh, NY 11793.

C. Study includes the electric utility company's protective devices, power plant generators, service entrance equipment and distribution to the improvements at the Influent Pumping stations. All power distribution to that point whether existing or new is included. Equipment included, but not limited to:

1. Substations and distribution.
2. Switchgear, switchboards, and panelboards.
3. Motor control centers.
4. Variable frequency controllers.
5. Disconnect switches.
6. Transfer switches.
7. 480V control panels.

D. The local electric utility is PSEG-LI.

E. Obtain all data necessary to perform the study. Data included, but not limited to:

1. Up to date one-line diagrams.
2. Equipment data.
3. Cable sizes and lengths.
4. Existing protective device settings.
5. Electric utility information: available fault current, protective device equipment information and settings, X/R ratios, transformer impedances and ratings.

F. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 DEFINITIONS

A. Boundary, Arc Flash: When an arc flash hazard exists, an approach limit from an arc source at which the incident energy equals 1.2 cal/cm² (5 J/cm²).

B. Boundary, Limited Approach: An approach limit at a distance from an exposed energized electrical conductor or circuit part within which a shock hazard exists.

C. Boundary, Restricted Approach: An approach limit at a distance from an exposed energized electrical conductor or circuit part within which there is an increased likelihood of electric shock, due to electrical arc-over combined with inadvertent movement.

D. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed and salvaged, or removed and reinstalled. Existing to remain items shall remain functional throughout the construction period.

E. Field Adjusting Agency: An independent electrical testing agency with full-time employees and the capability to adjust devices and conduct testing indicated and that is a member company of NETA.

F. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

G. Power System Analysis Software Developer: An entity that commercially develops, maintains, and distributes computer software used for power system studies.

H. Power Systems Analysis Specialist: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located.

I. Preliminary Short Circuit Report: Report that includes the maximum available utility fault current, proposed equipment, and existing equipment to determine if new equipment may be released for manufacturing and existing equipment is adequate for the calculated short circuit levels.

J. Protective Device: A device that senses when an abnormal condition or current flow exists and then removes the affected portion of the circuit from the system.

K. SCCR: Short-circuit current rating.

L. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

M. Single-Line Diagram: See "One-Line Diagram."

N. Supplier: The person, firm or corporation identified as such to provide the power system study and means the Supplier or its authorized agent. See also Power Systems Analysis Specialist.

O. VFD: Variable frequency drive. Interchangeable with variable frequency controller.

1.4 ACTION SUBMITTALS

A. Supplier qualifications per Quality Assurance paragraph. Submit prior to starting study. Include the following:

1. Brief description of each qualifying study.
2. Name of owner of installation on which study was performed with address, telephone number, and contact person.
3. Date of study.
4. Any other information indicating the firm's experiences and ability to perform the work and business status.

B. Preliminary Power System Study Report. Report must be approved prior to release for manufacture of major electrical equipment including but not limited to switchgear, switchboards, distribution panels, and motor control centers. Fault data from the utility must be included and not assumed or submittal will be rejected.

C. Final Power System Study Report. Report must be approved prior to energization of new major electrical equipment. Revise study as required for changes during construction.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data:

1. For Power Systems Analysis Software Developer.
2. For Power System Analysis Specialist.
3. For Field Adjusting Agency.

B. If requested, Product Certificates: For power system study software, certifying compliance with IEEE 399, IEEE 1584 and NFPA 70E.

C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Final power system study updated with any changes made after equipment start-up.

B. Digital computer files with full read-write access of the complete power system model and library.

1.7 QUALITY ASSURANCE

A. Perform Study using commercially developed and distributed software designed specifically for power system analysis.

B. Software algorithms shall comply with requirements of standards and guides specified in this Section.

C. Manual calculations are unacceptable.

D. Power System Analysis Software Qualifications:

1. Design computer program to perform short-circuit studies or have a function, component, or add-on module designed to perform short-circuit studies.
2. Develop computer program under the charge of a licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.
3. Complies with IEEE 399, IEEE 141, IEEE 242, IEEE 519, IEEE 1015, and IEEE 1584 as applicable to the project scope.

E. Power Systems Analysis Specialist Qualifications: Professional engineer licensed in the state where Project is located and has regularly engaged in this electrical engineering study specialty for minimum of five years and has performed at least three projects of similar complexity to this project within the last three years. Perform all elements of the study under the direct supervision and control of this professional engineer. Specialist shall be professionally independent of the manufacturers, suppliers, and installers of the equipment under evaluation.

F. Power System Study Certification: Report shall be signed and sealed by Power Systems Analysis Specialist.

G. Field Adjusting Agency Qualifications:

1. Employer of a NETA ETT-Certified Technician Level III or NICET Electrical Power Testing Level III certification responsible for all field adjusting of the Work.
2. A member company of NETA.
3. Acceptable to authorities having jurisdiction.

1.8 POWER SYSTEM STUDY MEETINGS

A. Supplier's professional engineer responsible for the study to attend a meeting with the Engineer and Owner at the Owner's facility up to and including three times.

B. Purpose of the three meetings are:

1. Initial meeting discusses the study's scope and the Owner's operational and maintenance requirements prior to the preliminary study submittal.
2. Second meeting discusses the preliminary study and its recommendations. Based on this meeting, the Owner may request modifications to the studies' recommended protective settings to reduce the arc flash hazard or meet other operational objectives.
3. Third and final meeting presents the final study and its recommendations.

C. Provide a minimum of three-week notice to the Owner and Engineer in advance of all projected meeting dates.

PART 2 - PRODUCTS

2.1 POWER SYSTEM ANALYSIS SOFTWARE DEVELOPERS

A. Acceptable Software:

1. SKM System Analysis, Inc.: Power*Tools.
2. Operation Technology, Inc.: ETAP (Electrical Transient Analyzer Program).
3. EasyPower, Inc.: EasyPower.
4. Or equal.

2.2 POWER SYSTEM STUDY REPORT GENERAL REQUIREMENTS

A. Except for one-line diagrams, standard 8 1/2-inch by 11-inch pages, with total pages numbered.

B. Electronic PDF format copy with electronic bookmarks for each section.

C. Signed and sealed by a professional engineer registered in the state in which the project is located.

D. Organized in the following order:

1. Executive Summary.
2. Short Circuit Analysis.
3. Short Circuit Computer Printout.
4. Protective Device Coordination.
5. Motor Starting.
6. Arc Flash Hazard Analysis.
7. Harmonic Analysis.
8. Utility Data.
9. Modeled One Line Diagrams.

E. Information on one-line diagrams, legible when printed at 11-inch x 17-inch. Show the following:

1. Protective device designations and ampere ratings.
2. Conductor types, sizes, and lengths.
3. Transformer kilovolt ampere (kVA), impedance, and voltage ratings.
4. Motor and generator designations and kVA ratings.
5. Switchgear, switchboard, motor-control center, and panelboard designations and ratings.
6. Derating factors and environmental conditions.
7. Any revisions to electrical equipment required by the study.

F. Identifiers between the one-line diagram, short circuit study, coordination study, and arc flash study to be the same.

G. Include copies of correspondence with electric utility under utility data section of report. Correspondence to include names and contact information.

2.3 EXECUTIVE SUMMARY

A. Include summary of distribution system, information received from electric utility, major assumptions, adequacy of equipment to safely clear or close on any fault, identify problem areas and recommendations for resolving problem areas.

2.4 SHORT CIRCUIT

A. Comply with IEEE 399 and IEEE 551 (new 3002 series).

B. Include normal utility powered configuration, on-site generation configuration, and alternate modes of operation (i.e. alternate utility configuration, bus ties closed).

C. Include minimum and maximum possible fault conditions. Address three-phase bolted as well as ground fault conditions.

D. Consider the fault contribution of all motors operating during the maximum demand condition of the motors.

E. Calculate short-circuit momentary duties and interrupting duties based on an assumed bolted three-phase short circuit at each high and medium voltage switchgear bus and controller, low voltage switchgear bus, switchboard, motor control center, distribution panelboard, pertinent branch circuit panelboard and other significant locations throughout the systems. Include the X/R ratios, asymmetry factors, KVA and symmetrical fault-current in the short circuit tabulations. Provide a ground fault current study for the same system areas. Include in tabulations fault impedance, X/R ratios, asymmetry factors, motor contribution, short circuit KVA, and symmetrical and asymmetrical fault-currents.

F. Include representation of the site power system, the base quantities selected, impedance source data, calculation methods and tabulations, one-line diagrams, conclusions and recommendations.

G. Identify available fault current at each bus and evaluate system elements including but not limited to equipment, protective devices, and cables.

H. Base current transformers' ratio and burden calculations on a 10 percent maximum ratio error per IEEE C57.13. Identify current transformers that will not allow the protective devices to operate within acceptable IEEE error margins and recommend corrective action.

I. List momentary, interrupting, and/or withstand rating of all key elements of the distribution system along with the maximum available fault current in tabular form and clearly indicate the adequacy of the element with PASS / FAIL designation.

J. Short Circuit Computer Printout:

1. Calculations shall be in sufficient detail for easy review.
2. Back up calculations shall become part of the final report.

© 2026 CDM Smith
All Rights Reserved

2.5 PROTECTIVE DEVICE COORDINATION

A. Comply with IEEE 242 (new 3004 series).

B. Utilize results from the short circuit study and balance the competing objectives of protection and continuity of service for the system specified, considering the basic factors of sensitivity, selectivity and speed. Include all system protective devices in the coordination analysis, not just overcurrent protective devices. This includes, but is not limited to under and over voltage protective relays, frequency relays, differential relays and reverse power relays.

C. Show graphic indication of coordination between protective devices in the form of full color time-current coordination (TCC) plots with each protective device curve in a unique color for easy review.

D. Provide separate TCC plots for each mode of operation. Provide separate TCC plots for “normal” and “stand by” operation. Show maximum fault values in each case. Both power sources shown on one plot is unacceptable.

E. Provide separate TCC for phase over-current and ground fault.

F. Show no more than six devices on one TCC. Of these six curves, two (the largest upstream device and the smallest downstream device) shall repeat curves shown on other coordination plots to provide cross-reference. Designate each TCC with a unique identifier and include each TCC identifier and descriptive title in the study’s table of contents.

G. Include in each TCC the following as applicable:

1. TCC name and description.
2. One-line diagram.
3. Identifiers on one-line diagram and curves.
4. Significant motor starting characteristics.
5. Appropriate NEC protection points.
6. Appropriate ANSI/IEEE protection points.
7. Magnetizing inrush points of transformers.
8. Transformer damage curves.
9. Complete operating bands for low voltage circuit breaker trip devices and fuses.
10. Relay coil taps, time-dial settings and pickup settings.
11. Significant symmetrical and asymmetrical fault currents.
12. Power cable withstand curves.
13. Generator short circuit decrement and thermal limit curves.

H. Terminate device characteristic curve on TCC at a point reflecting the maximum symmetrical or asymmetrical fault current to which that device is exposed, based on the short circuit study.

I. Select each primary protective device for a delta-to-wye-connected transformer so the characteristic or operating band is within the transformer parameters; where feasible, include a parameter equivalent to 58 percent of the ANSI C37.91 withstand curve to afford protection for secondary line-to-ground faults.

J. Separate low voltage power circuit breakers from each other and the associated primary protective device, by a 16 percent current margin for coordination and protection in the event of line-to-line faults.

K. Separate protective relays by a 0.3-second time margin for the maximum 3 phase fault conditions to assure proper selectivity.

L. Optimize settings for breakers and relays to provide the most effective protection practicable for all modes and power sources.

M. Include at least all devices down to largest branch circuit and largest feeder circuit breaker in each motor control center and/or power distribution panelboard. Include all adjustable setting ground fault protective devices.

N. Provide tabulations of recommended settings for all protective devices. Where devices are existing, highlight any changes from the existing setting to the proposed recommended setting.

O. Provide all information required to program/set multifunction solid state relays.

2.6 MOTOR STARTING

A. Comply with IEEE 141 (new IEEE 3001 series) for recommended light flicker limits and IEEE 3002.7 for motor starting studies.

B. Provide motor starting study for all large electric drives (100 horsepower and larger). Include all operating modes.

C. Identify any concerns about voltage drop or power inrush limitations due to the starting of motors.

2.7 ARC FLASH HAZARD

A. Comply with IEEE 1584, NFPA 70, and NFPA 70E as applicable.

B. Utilize short circuit and protective device coordination results to provide arc flash hazard analysis. Perform calculations in accordance with IEEE 1584.

C. Calculate the incident energy levels at each faulted bus for each mode of operation and for both maximum and minimum fault currents.

D. Include calculations at line side and load side of main breakers, where applicable.

E. Provide tabular report for all modes and conditions and include “worst case” summary. Use the “worst case” to generate the arc flash labels. Include:

1. Fault location.
2. Arcing fault magnitude.
3. Protective device clearing time.
4. Duration of the arc.
5. Arc flash boundary.

6. Working distance.
7. Incident energy.
8. Electrode configuration.

F. Highlight any available incident energy over 40 cal/cm² and provide recommendations to mitigate the hazard.

G. Arc Flash Labels:

1. Machine printed, 4-inches x 4-inches (nominal), thermal transfer, high adhesion polyester.
2. Provide UV resistant laminate for outdoor labels.

H. Arc Flash Label Information:

1. Equipment name.
2. Identifier LINE or LOAD where equipment has potential different energy levels.
3. Arc flash hazard information: arc flash boundary and incident energy in cal/cm².
4. Shock hazard information: limited approach and restricted approach boundaries.
5. Personal Protective Equipment (PPE) requirements.
6. Study Supplier, project number, and date.

I. Provide arc flash label sample with preliminary report.

J. Do not be print the labels until equipment is energized and protective devices set according to the approved final protective device coordination study.

PART 3 - EXECUTION

3.1 POWER SYSTEM DATA

A. Obtain all data necessary for conduct of the study.

1. Verify completeness of data supplied on one-line diagram. Call any discrepancies to Engineer's attention.
2. For equipment included as Work of this Project, use characteristics submitted under provisions of action submittals and information submittals for this Project.
3. For equipment that is existing to remain, obtain required electrical distribution system data by field investigation and surveys conducted by qualified technicians and engineers. Qualifications of technicians and engineers shall be as defined by NFPA 70E.

B. Gather and tabulate the required input data to support the power system study.

C. Field data gathering for existing systems shall be under direct supervision and control of the engineer in charge of performing the study and shall be by the engineer or its representative who holds NETA ETT-Certified Technician Level III or NICET Electrical Power Testing Level III certification.

D. Data included, but are not limited to, the following:

1. Product data for overcurrent protective devices and existing settings.
2. Electrical power utility information. Information required may include:

    a. Available minimum and maximum three-phase fault current and X/R ratio.
    b. Available minimum and maximum single-line-to-ground fault current and X/R ratio.
    c. Service transformer voltage, kVA, and impedance ratings, winding configuration, and grounding method.
    d. Upstream protective device data.

3. Power sources and ties.
4. For switchgear, switchboards, panelboards, and motor control centers, ampacity and SCCR in amperes RMS symmetrical.
5. For transformers, kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
6. For reactors, manufacturer and model designation, voltage rating, and impedance.
7. For circuit breakers, trip units, and fuses, manufacturer and model designation. List type of breaker, type of trip, SCCR, current rating, and breaker settings.
8. For generators, short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
9. For busways, manufacturer and model designation, current rating, impedance, lengths, and conductor material.
10. For motors, horsepower and NEMA MG 1 code letter designation.
11. Conductor sizes, lengths, number, conductor material, shield parameters for medium voltage cable, and conduit material (magnetic or nonmagnetic).
12. For relays, manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
13. For transfer switches, withstand and closing ratings (WCR) with time duration.
14. Derating factors.

3.2 FIELD QUALITY CONTROL

A. Do all testing and adjustment prior to the energization of new equipment.

B. Test existing adjustable protective devices in accordance with NETA MTS.

C. Test new adjustable protective devices in accordance with NETA ATS.

D. Adjust existing and new protective devices according to approved coordination study.

E. Testing and adjusting shall be by a full-time employee of the Field Adjusting Agency, who holds NETA ETT-Certified Technician Level III or NICET Electrical Power Testing Level III certification.

F. After successful testing and adjustment, install calibration sticker with Field Adjusting Agency name, employee initials, and date of calibration at each relay or protective device.

G. After energization, minor adjustments to settings may be required to commission the equipment.

H. Submit field report and list any changes made during field adjustment or commissioning for update for record submittal of study.

I. For adjustable breakers, install sticker listing final adjusted settings, i.e. LTPU, LTD, STPU, STD, INST, GFPU, and GFD.

3.3 ARC FLASH LABELING

A. After the field adjustment of relays and protective devices, apply arc flash study labels.

B. Apply arc flash labels on the front covers of the following equipment:

1. Substations and distribution transformers.
2. Medium voltage switches.
3. Switchgear, switchboards, and panelboards.
4. Motor control centers.
5. Variable frequency controllers.
6. Disconnect switches.
7. Transfer switches.
8. 480V control panels.

C. Apply arc-flash labels at each section for large equipment such as switchgear and motor control centers.

D. Install LINE and LOAD arc-flash labels as applicable.

E. Remove any previous arc flash study labels as applicable and install new labels under the direction of the Power System Analysis Specialist.

SECTION 260800 - COMMISSIONING OF ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes procurement of the services of an Electrical Testing Firm Supplier (ETFS) to provide all materials, equipment, labor, and services required to achieve a fully commissioned electrical system.

B. The intent of the Section is to:

1. Provide electrical system construction planning.
2. Provide summary qualifications of the testing firm.
3. Summarize division of responsibility for electrical commissioning.
4. Define additional testing, inspections, and adjustments.

C. The following Division 26 Sections include testing and/or settings requirements:

1. Section 260513 “Medium-Voltage Cables”.
2. Section 260516 “Low-Voltage Electrical Power Conductors and Cables”.
3. Section 260523 "Control-Voltage Electrical Power Cables”.
4. Section 260526 “Grounding and Bonding for Electrical Systems”.
5. Section 260573 "Power System Studies”.
6. Section 261839 “Medium-Voltage motor Controllers”.
7. Section 262200 “Low-Voltage Transformers”.
8. Section 262413 “Switchboards”,
9. Section 262416 “Panelboards”.
10. Section 262505 “480V Control Panels”.
11. Section 262816 “Enclosed Switches and Circuit Breakers”.
12. Section 263600 “Transfer Switches”.

D. Other Divisions include electrical testing requirements for equipment with electrical components. These include:

1. Automation Equipment – Division 40.
2. Process Mechanical Equipment and Associated Motors – Divisions 40 through 46.

E. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.

2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 DEFINITIONS

A. Electrical Testing Firm Supplier (ETFS): The firm responsible for providing specialty and independent testing and adjustments of electrical systems on the project..

B. Low Voltage: 600 V and below.

C. Maintenance of Plant Operations (MOPO): A construction plan which prevents or limits process disruptions during construction.

D. Medium Voltage (MV): 601 V and above.

E. "Systems," "Assemblies," "Subsystems," "Equipment," and "Components": Where these terms are used together or separately, they mean "as-built" systems, assemblies, subsystems, equipment, and components.

1.4 MEETINGS

A. Conduct a project kickoff coordination meeting within two weeks after submitting the MV Master Project Plan. The purpose of the meeting is to discuss the ETFS's MV Master Project Plan, regarding installation and testing associated with the medium voltage system.

B. Hold meeting at Owner's designated location. Attendance to include representatives of the Owner, Engineer, Contractor (general, electrical, EFTS), and Equipment Manufacturer(s).

C. As MV system construction is done in phases, hold additional meetings as required during construction. The purpose of these meetings are to ensure MOPO and safety by proper planning of upcoming construction and testing activities.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For electrical testing firm supplier (ETFS) and personnel intended for the project.

B. Field Quality-Control Reports:

1. Table of contents / Executive summary.
2. Test procedures and equipment used, include calibration dates.
3. Test results that comply with requirements.
4. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
5. Typed test forms, no handwritten entries.

C. Certification that all relays on MV equipment have been adjusted to the power system study final approved setting.

D. Certification that all adjustable circuit breakers have been adjusted to the power system study final approved setting.

E. Certification that arc flash labels that correspond to the final approved power system study have been applied.

1.6 ACTION SUBMITTALS

A. MV Master Project Plan.

1. Submit, within 60 calendar days after Notice to Proceed, the MV Master Project Plan. Plan to include the following:

a. Informational submittal qualification data.
b. Detailed construction phasing for the MV system.
c. Required shutdowns and estimated durations.
d. Temporary power plans for MOPO.

B. Additional MV Project Plans.

1. Submit, no later than 30 calendar days prior to a requested MV system shutdown, a MV Project Plan for upcoming shutdown activities. Plan to include the following:

a. Shutdown and Re-Energization Switching Procedures. Shutdown Procedures will include areas intended to be shutdown, expected duration of shutdown, staffing, safety plans, one line diagrams showing associated breakers or switches with their status (opened, closed, racked out, temporary grounds) and lockout-tagout locations. Re-Energization Procedures will include same information as Shutdown Procedures, but also phasing and rotation check locations upon re-energization.
b. Failure to submit plan in a timely manner will cause the shutdown to be rescheduled.

C. Switchgear and Generator Test Plan.

1. Submit, no later than 30 calendar days prior to first equipment start-up, a plan for operational checks.

D. Power Monitoring / SCADA Verification Plan.

1. Submit, no later than 30 calendar days prior to substantial completion, the list of SCADA points to confirm. Confirmation of actual data (i.e. the breaker is open/closed; amps / volts / kVA readings are correct) is to be done when load is running.

1.7 QUALITY ASSURANCE

A. ETFS Qualifications: Corporately and financially independent testing organization, to provide unbiased test results, and is professionally independent of the manufacturers, suppliers, and installers of equipment or systems evaluated by the testing firm.. The ETFS, may be but is not required to be the same firm as the power system study supplier.

B. ETFS: Electrical Engineer Qualifications: Senior level electrical engineer, experienced in medium voltage industrial electrical systems with source transfer switchgear.

C. ETFS Electrical Technician Qualifications: NETA or ETT Certified Technician Level III or NICET Electrical Power Testing Level II Certification.

1.8 DIVISION OF RESPONSIBILITY

A. Electrical Contractor Responsibilities Include:

1. Routine insulation-resistance, continuity, and rotation checks prior to and in addition to manufacturer or EFTS testing.
2. Transformer voltage checks and adjustment of taps.
3. Phasing checks across tie breakers and transfer switches.
4. Motor rotation and ampacity checks, overload settings, field test reports.
5. Provide suitable and stable source of electrical power required for testing.
6. Coordination and scheduling with Owner, Engineer, Equipment Manufacturers/Suppliers, and ETFS.
7. Obtain the power system study. Engineer must review and approve study prior to placing any new equipment in service.

B. Equipment Manufacturer Responsibilities:

1. Installation checks and testing as listed per individual Section.

C. ETFS Responsibilities:

1. Installation checks and testing as listed per individual Section.
2. Switchgear and Generator commissioning as a system.
3. Verification of correct power monitoring on the SCADA system.
4. Setting and adjustments to protective devices and adjustable circuit breakers per the final approved power system study.
5. Installation of arc flash labels.
6. Final infrared testing as listed per individual Section of all new, relocated, or re-terminated equipment.

D. Additional Testing, Inspections, and Adjustments:

1. Infrared testing of non-modified equipment is not included / required.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 GENERAL TESTING REQUIREMENTS

A. Field testing and commissioning is intended to follow the latest revisions of NETA Standard ATS, ECS, and MTS as applicable unless otherwise modified in these Sections.

B. Site standard phase rotation is clockwise. That is when phases A, B, C are connected to terminals 1, 2, 3 the phase rotation will be clockwise. If phase rotation must be corrected, it should be done at the end device, i.e. the motor.

C. Where two in-house potential sources are present and may be connected, regardless of the safety interlocks provided, testing to verify correct phasing is required. Without checking this, one source may have clockwise rotation with a 123-ABC and the second source may have a clockwise rotation with a 123-BCA installation. A three-phase short would result if safety interlocks fail and these two sources are connected inadvertently. Hot phase testing is required at all two source locations. This includes the following equipment on this project:

1. Switchgear S1
2. Switchgear S3
3. Load Break Switch P1/P3
4. Load Break Switches P2/P4
5. Load Break Switches P5/P6.
6. Substation T1/T2
7. Switchboard RTU
8. MCC P-10
9. MCC P-11

3.2 FIELD QUALITY CONTROL

A. Verify electrical equipment and systems have been tested in compliance with Contract Documents.

B. Provide reports.

SECTION 261839 - MEDIUM-VOLTAGE MOTOR CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes medium-voltage motor controller assembly and accessories.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
3. Section 260573 “Power System Studies” for motor starting.
4. Section 260800 “Commissioning of Electrical Systems” for startup and commissioning of medium-voltage motor control centers.
5. Section 400593.13 “Medium-Voltage Motor Requirements for Process Equipment” for motors.

1.3 ACTION SUBMITTALS

A. Product Data: For each type and rating of medium-voltage motor controller indicated.

1. Include descriptive bill of materials, literature, and catalog cut sheets of components and accessories.
2. Include time-current characteristic curves for power fuses and protective relays.
3. Include protective relay instruction manuals.
4. Include equipment installation manuals.

B. Shop Drawings:

1. Include a tabulation of installed devices with features and ratings.
2. Include dimensioned plans and elevations, showing dimensions, shipping sections, and weights of each assembled section. Elevations shall show major components, features, and mimic bus diagram.
3. Include a plan view and cross section of equipment base showing clearances, manufacturer's recommended workspace, and locations of penetrations for grounding and conduits. Show location of anchor bolts and leveling channels.

4. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, and location and size of each field connection.
5. Locate accessory and spare equipment storage.
6. Include single-line diagram.
7. Include control power wiring diagrams.
8. Include copy of nameplate.
9. Include ratings for the controller assembly:

    a. Voltage.
    b. Continuous current.
    c. Short-circuit current.
    d. BIL.

10. Include Power factor calculations for review.

11. Include relay settings.
12. Include interface data with monitoring or control network.
13. Include Wiring Diagrams: For each controller assembly include the following:

    a. Power, signal, and control wiring.
    b. Three-line diagrams of current and future secondary circuits showing device terminal numbers and internal diagrams.
    c. Schematic control diagrams.
    d. Diagrams showing connections of component devices and equipment.
    e. Schematic diagrams showing connections to remote devices including connection details to the communications network.

C. Specification Compliance:

1. Include a copy of this specification confirming compliance with each paragraph. For deviations, provide detailed commentary to explain the deviation.

1.4 INFORMATIONAL SUBMITTALS

1. Indoor Installations:

    a. Dimensioned concrete base, outline of the medium-voltage motor controllers, conduit entries, and grounding equipment locations.
    b. Support locations, type of support, and weight on each support. Locate structural supports for structure-supported raceways, cable trays, busways and seismic anchors.
    c. Location of lighting fixtures, sprinkler piping and heads, ducts, and diffusers.

B. Qualification Data: For testing agency.

C. Seismic Qualification Data: Certificates, for each motor controller, accessories, and components, from manufacturer.

1. Certificate of compliance.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based, and their installation requirements.

D. Source quality-control reports.

E. Field quality-control reports.

F. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For medium-voltage motor controllers and accessories to include in emergency, operation, and maintenance manuals. Include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
2. Time-current curves, including selectable ranges for each type of overcurrent protective device.
3. “As-Built” shop drawings.
4. For each motor controller, a tabular listing including the following:

    a. Motor data including name, equipment tag, and nameplate full load current.
    b. “As-Left” settings for adjustable devices such as timers and protective relays.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. One non-contact audio-visual medium voltage tester with batteries, storage case and clamp stick adapter.

B. One set of three 10 foot grounding jumpers and storage bags.

C. One clamp stick with canvas storage bag.

D. One portable lifting device for transporting contactor outside its compartment.

E. One remote operator for controller isolation switch.

F. Touchup paint: half-pint container of paint matching the enclosure exterior finish**.**

G. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Indicating Lights (lamp and lens cap): Two of each type and color installed.
4. One dozen each of cover bolts, spring nuts and door fasteners.

5. Vacuum Contactor Bottles: Three of each size and type.
6. Surge Arrestors: Three of each size and type.
7. Protective Relays: One of each type.
8. Control Power Transformer: One of each size and type.
9. Power Cell: One of each size and type.

1.7 QUALITY ASSURANCE

A. Testing Agency Qualifications: Accredited by NETA.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Comply with manufacturer’s instructions and Section 260010 “Supplementary Requirements for Electrical” for delivery, storage, and handling.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace medium-voltage motor controllers that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to equipment manufacturer restrictions listed in Section 260010 “Supplemental Requirements for Electrical”, medium-voltage motor controllers from the following manufacturers are approved:

1. ABB - Limitamp.
2. Eaton - Ampgard.
3. Rockwell Automation - Allen-Bradley CENTERLINE 1500.
4. Schneider Electric - Square D Motorpact.
5. Siemens - SIMOVAC.

B. Source Limitations: Obtain each medium-voltage controller from single source from single manufacturer.

2.2 SYSTEM DESCRIPTION

A. Medium-voltage motor controller assembly, ANSI / NEMA rated, and UL labeled for installation on4.16 kV, 3 phase, 3 wire, 60 Hz, grounded distribution system.

B. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

C. Comply with the following standards:

1. UL 347, Medium-Voltage AC Contactors, Controllers and Control Centers.

2.3 CONSTRUCTION

A. Free-standing, dead-front, front accessible only, assembly of vertical sections, each with motor starters as indicated on drawings, and bolted to form a rigid assembly.

B. Indoor Locations: NEMA Type 1A enclosure unless otherwise indicated on drawings.

C. Power Bus: Tin plated copper, ampacity rating as indicated on Drawings. Located in its own compartment for maintenance and extension. Bus short circuit current rating: 50 kA symmetrical for 2 seconds.

D. Ground Bus: Tin plated copper along the entire length of the assembly.

E. BIL: 60 kV.

F. Maximum Dimensions: As indicated on drawings.

G. Assembly Configuration:

1. Isolate and compartmentalize low-voltage circuits and devices, medium-voltage main power bus, and medium-voltage power cell compartment. Provide separate control compartment with doors.
2. Power and control circuits to enter assembly from either top or bottom for indoor enclosures and bottom only for outdoor enclosures.
3. Provide adequate termination space for stress cone installation of shielded medium-voltage cables of size indicated on Drawings.

H. Exterior Enclosure Finish: Factory-applied finish in manufacturer's standard color over a rust-inhibiting primer on treated metal surface.

I. Interior Enclosure Finishes:

1. Control and power cell compartment: high gloss white for easier visibility.
2. Unpainted steel parts, plated for corrosion resistance.

J. Printed circuit boards: Conformal coated.

K. When wires or buswork passes through holes or sections, add suitable guarding or grommets for close fit and to prevent cutting or chafing of insulation.

© 2026 CDM Smith
All Rights Reserved

2.4 MEDIUM-VOLTAGE CONTROLLERS

A. Product Description: NEMA Class E2 medium-voltage controller using power fuses and vacuum contactor in combination to provide motor control and short circuit protection.

B. Interrupting Rating: 50 kA rms symmetrical at nominal utilization voltage.

C. Isolation Switch:

1. Three-pole gang operated; non-load break quick-make quick-break type operated by an externally mounted handle to isolate power cell.
2. Size: As indicated on Drawings.
3. Electrically and mechanically interlocked with the vacuum contactor to prevent operation under load, and operating the switch with the door open.
4. Switch blades grounded in the off position.
5. Auxiliary contacts: 2 N.O., 2 N.C, unless otherwise indicated on Drawings.
6. Handle: padlocking provisions for 3 padlocks, and mechanically trapped key interlocking.
7. Viewing window in low-voltage compartment to confirm switch position.

D. Medium Voltage Fuses: As indicated in the ACCESSORIES Article.

E. Motor Type and Size: As specified in Section 400593.13 “Medium-Voltage Motor Requirements for Process Equipment”, horsepower rating as indicated on Drawings.

F. Motor Starting Method: Reduced Voltage Autotransformer, Non-Reversing (RVAT-NR), unless indicated otherwise on Drawings.

G. Contactor:

1. NEMA/ANSI type, drawout vacuum type, size 400A, unless indicated otherwise on Drawings.
2. Electrically held unless indicated otherwise on Drawings.
3. Vacuum contactor wear check.

H. Additional Features:

1. Blown power fuse indication.
2. Compression lugs and ground lugs for power terminations as shown on Drawings.
3. Infrared viewing window.

2.5 LOAD-BREAK SWITCH

A. Main load break switch for switching primary power source and feeder load break switch for switching other loads. Size and fusing as indicated on Drawings.

B. Mechanical interlock to prevent door opening when the switch is in closed, and to prevent closing the switch when the door is open.

C. A polycarbonate viewing window in the power cell door to view the position of the isolation handle.

D. Load-Break Switches are to be provided in motor control construction and match dimensions shown on the drawings.

2.6 INTEGRATED EQUIPMENT

A. Integrate the following equipment where shown on the Drawings.

B. Power Factor Correction Capacitors (PFCC): Installed by the MV Motor Controller manufacturer, furnished by motor manufacturer.

1. Kvar rating as shown on drawings and validated by submitted calculations.

2.7 ACCESSORIES

A. Surge Arresters: Comply with IEEE C62.11, distribution class, metal-oxide-varistor type, voltage rating as required for nominal system voltage and grounding configuration listed in SYSTEM DESCRIPTION Article; mount in incoming line compartment.

B. Medium Voltage Fuses:

1. Motor Application: Manufacturer selected. Provide R-rated, current-limiting fuses with 50 kA interrupting rating. Fuse to provide visual indication when blown.
2. Load-Break Switch Application: Manufacturer selected for transformer application to coordinate with transformer inrush and damage curve. For other applications refer to Drawings. Provide E-rated, current-limiting fuses with 50 kA interrupting rating. Fuse to provide visual indication when blown.
3. Control Power Application: Manufacturer selected.

C. Motor Protection and Management Relay:

1. Manufacturer, no exception: Schweitzer Engineering Laboratories; SEL-710 Motor Protection Relay.
2. Product Description: Motor protection, fault diagnostics, power metering, and communications functions, integrated into complete draw-out package.

a. Suitable for protection and management of three phase medium and large induction or synchronous motors and associated driven equipment, including high inertia, two speed and reduced voltage start motors.
b. Include communication interface and protocol with SCADA System per NETWORK COMMUNICATIONS Article. Include RJ45 communications jack.
c. Comprehensive motor protection plus voltage dependent overload curves, torque metering and protection, broken rotor bar protection.
d. HMI backlit display to view relay information and settings in direct sunlight, face-mounted keypad and setpoint navigation keys.
e. Provide input terminals for resistance temperature detector (RTD) or thermocouple inputs, and low-voltage analog inputs.
f. Provide input terminals for programmable digital inputs.
g. Provide terminals for programmable digital outputs.
h. Power supply: 120VAC.

i. Current input: 5A.

D. Controls and Devices:

1. Built-in test circuit to permit checkout of motor control when medium-voltage circuit is de-energized. Test circuit powered from 120 Vac external source via polarized plug connector, accessible only when low voltage door is open.
2. As indicated on Drawings, industrial duty.
3. Cover Mounted Pilot Devices: NEMA ICS 5, heavy duty oil-tight type, 30 mm.
4. Indicating Lights: LED types; push-to-test. Color as indicated on drawings.
5. Selector Switches: Rotary type.

E. Control Power Transformers: 120 volt secondary, sized for additional load where indicated. Furnish fused primary and secondary, and bond unfused leg of secondary to enclosure.

F. Control and Secondary Wiring: 600V, tin-plated stranded copper, type SIS, flameproof, grouped together with harness or in ducts and secured to the structure. Minimum size No. 14 AWG for control and voltage circuits, minimum size No. 12 AWG for CT circuits. Terminated on 600V rated terminals and labeled at each termination point.

G. Instruments:

1. Instrument Transformers: Manufacturer selected for burden and accuracy per application and in compliance with IEEE C57.13.
2. Potential Transformers: Two-winding, encapsulated with primary and secondary fuses.
3. Current Transformers: Provide zero-sequence CT when ground fault protection is specified. Terminate CT winding in a screw type terminal on the CT housing and to shorting terminal blocks using ring type terminations. Output current: 5 amp.

2.8 NETWORK COMMUNICATIONS

A. Include interfacing hardware, cables, connectors, software, etc. for communication with SCADA system specified in Division 40.

B. Motor control will be via hardwired signal and digital communications signal.

C. Digital communication signal will utilize copper Ethernet cable using Modbus TCP/IPcommunications protocol. Communication between individual motor controllers and SCADA system will be in a star configuration.

D. Provide 24 V dc UPS / battery backup to allow ride-through control during plant generator start and transfer, up to 60 second power interruption.

2.9 IDENTIFICATION

A. Nameplates:

1. White background / black lettering.
2. All interior and exterior devices – 1/4-inch high lettering.
3. Master nameplates for equipment and section designations – 1-inch high lettering

B. Control wiring: heat-shrink or sleeve type typed wire markers, matching manufacturer's wiring diagrams at each termination point.

C. Warning signs on terminals that remain energized with power disconnect OFF.

D. Warning signs or indication at cubicles with a foreign voltage present (i.e. external voltage source for space heaters).

E. Phase (A, B, C) input and output power connections identified with labels.

2.10 SOURCE QUALITY CONTROL

A. Test and inspect equipment according to UL, NEMA, and manufacturer.

B. Factory inspection and witness.

1. Make completed controllers available for inspection at manufacturer's factory prior to packaging for shipment.
2. Allow witnessing of factory inspections and tests at manufacturer's test facility.
3. Include travel costs for two personnel (one Owner and one Engineer representative). Travel costs include, but are not limited to, sufficient days/nights necessary for transportation, lodging, meals, and expenses.
4. Notify engineer a minimum of two weeks prior to travel requirement.

C. Physical inspection:

1. Verify compliance with drawings and specifications.
2. Verify nameplates, labels, and identification.
3. Verify isolation barriers are present to protect personnel and equipment.
4. Verify bus and connections have proper clearance and torque.
5. Verify tightness of control and power wires.
6. Verify mechanical interlocks.

D. Electrical tests:

1. Perform functional and continuity checks.
2. Perform dielectric withstand test on buswork and power cable (phase-to-phase, phase-to-ground).
3. Perform I/O check and functionality operation per diagrams.
4. Test functionality of protective relays, meters, instruments, controls.

E. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Upon delivery of controllers and prior to unloading, inspect equipment for damage:

1. Examine tie rods and chains to verify they are undamaged and tight, and that blocking and bracing are tight.
2. Verify that there is no evidence of load shifting in transit and that readings from transportation shock recorders, if equipped, are within manufacturer's recommendations.
3. Examine controllers for external damage, including dents or scratches in doors and sill, and termination provisions.
4. Compare controllers and accessories received with the bill of materials to verify that the shipment is complete. Verify that controllers and accessories conform to the manufacturer's quotation and shop drawings. If the shipment is not complete or does not comply with project requirements, notify the manufacturer in writing immediately.
5. Unload controllers, observing packing label warnings and handling instructions.
6. Open compartment doors and inspect components for damage or displaced parts, loose or broken connections, cracked or chipped insulators, bent mounting flanges, dirt or foreign material, and water or moisture.

B. Examine roughing-in of conduits and grounding systems to verify the following:

1. Wiring entries comply with layout requirements.
2. Entries are within conduit-entry tolerances specified by manufacturer, and no feeders will have to cross section barriers to reach load or line lugs.

C. Pre-Installation Checks:

1. Verify removal of any shipping bracing after placement.

D. Verify that ground connections are in place and that requirements in Section 260526 “Grounding and Bonding for Electrical Systems” have been met.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer’s published instructions. Level and anchor equipment. Remove temporary lifting angles, lugs and shipping braces. Touch up damaged paint finishes.

B. Switch operating handles located above 79 inches above operating floor to have operating arm extension.

C. Install controllers plumb and level and with each section aligned properly.

D. Grout and caulk voids beneath equipment base.

E. Make electrical connections between equipment sections using connectors furnished by manufacturer.

F. Ground and bond controllers in accordance with Section 260526 “Grounding and Bonding for Electrical Systems”.

G. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and NFPA 70.

H. Maintain adequate clearance between medium-voltage power, low-voltage control, and communications wiring to avoid electro-magnetic interference.

I. Terminate medium-voltage cables according to Section 260513 “Medium-Voltage Cables”.

J. Tighten bolted connections and wiring connections using calibrated torque wrench or torque screwdriver per manufacturer’s written instructions.

K. Obtain the manufacturer’s services for the commissioning and startup work.

3.3 IDENTIFICATION

A. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

1. Identify equipment by name designation and fed from source nameplates.
2. Identify field-installed conductors, interconnecting wiring, and components.

B. Install Arc Flash Labels in accordance with Section 250573 “Power System Studies”.

3.4 FIELD QUALITY CONTROL

A. Division of Responsibilities:

1. Provide installation and assist with all testing and startup activities.
2. Engage factory authorized service representative to assist in installation, inspection, testing, startup, and commissioning activities specified herein to active manufacturer’s warranty.
3. Engage a qualified testing agency as defined in this Section to perform activities defined in Section 260800 “Commissioning of Electrical Systems”.

B. General Requirements:

1. Perform inspection, testing, and startup activities recommended by and in accordance with manufacturer’s instructions, NETA ATS, and as specified herein. Perform testing and test methods in compliance with NFPA 70B. Provide materials and labor as necessary. Correct deficiencies, make adjustments, and retest until requirements are met. Provide written report for each field testing or service visit.

C. Visual and Mechanical Inspection:

1. Compare medium-voltage motor controller and motor nameplate data and confirm compatibility.
2. Inspect physical and mechanical condition.
3. Inspect anchorage, alignment, and grounding.
4. Verify tightness of accessible bolted electrical connections. Use calibrated torque wrench.
5. Verify unit is clean.
6. Verify smooth operation of mechanical devices and correct operation of interlocks.

D. Electrical Tests:

1. Ratio and polarity tests on instrument transformers.
2. Ground resistance test.
3. Insulation resistance test (bus and switches).
4. Vacuum bottle integrity test.
5. Test protective parameters as recommended by manufacturer.
6. Verify correct input and output voltages, currents, and phase rotations.

E. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each medium-voltage motor controller line-up.

1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
2. Perform follow-up infrared scan of equipment, at 11 months after Substantial Completion.
3. Prepare a certified report identifying equipment checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

F. Medium-voltage motor controllers will be considered defective if they do not pass tests and inspections.

3.5 STARTUP SERVICE

A. The following items must be complete prior to startup service:

1. Driven equipment installed and ready for loading.
2. Associated SCADA system installed and programmed.

B. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Field test hardwired discrete and analog connections and any digital communication signals connected to verify proper operation.

C. Make adjustments to medium-voltage motor controllers and connected devices for manual and automatic operation of the driven equipment to operate as a system as shown on the Contract Documents. Include:

1. Trip settings in accordance with approved power system study.
2. Programming parameters.
3. Timing relays.

D. Clear events memory after successful startup.

3.6 ADJUSTING

A. Adjust protective relays in accordance with the final approved submittal of Section 260573 “Power System Studies”.

B. Adjust motor starting and stopping parameters for RVSS controllers as needed by the driven load and Owner requirements.

C. Set field-adjustable time-delay relays and switches as needed by the driven load and Owner requirements.

3.7 DEMONSTRATION AND TRAINING

A. Engage a factory-authorized service representative to demonstrate correct operation, adjust settings, and maintain medium-voltage motor controllers to Owner.

B. Provide 8-hour man day[s] for instruction. Time instruction to cover all working shifts.

3.8 CLEANING

A. Remove rubbish and debris from inside and around the equipment. Remove dirt, dust, or concrete spatter from the interior and exterior of the equipment using brushes, vacuum cleaner, or clean, lint-free rags. Do not use compressed air.

SECTION 262200 - LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the following types of low voltage dry-type transformers:

1. Distribution type.
2. Transformer panel assemblies.
3. Drive-isolation type.

B. Related Requirements:

1. Section 260010 “Supplemental Requirements for Electrical” for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product used on project. Note this Section may include products not required for the project.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type and size of transformer.
2. Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer.

B. Shop Drawings:

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of field connections.
2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment.
3. Include diagrams for power, signal, and control wiring.

© 2026 CDM Smith
All Rights Reserved

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Field-quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Inspection: On receipt, inspect for and note shipping damage to packaging and transformer.

1. If manufacturer packaging is removed for inspection, and transformer will be stored after inspection, re-package transformer using original or new packaging materials that provide protection equivalent to manufacturer's packaging.

B. Storage: Store in warm, dry, and temperature-stable location in original shipping packaging.

C. Temporary Heating: Apply temporary heat in accordance with manufacturer's published instructions within enclosure of ventilated-type units, throughout periods during which equipment is not energized and when transformer is not in space that is continuously under normal control of temperature and humidity.

D. Handling: Follow manufacturer's instructions for lifting and transporting transformers.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to equipment manufacturer restrictions listed in Section 260010 “Supplemental Requirements for Electrical, transformers from the following manufacturers are approved:

1. Eaton.
2. GE by ABB.
3. Siemens.
4. Square D by Schneider Electric.

B. Source Limitations: Obtain each type of transformer from single source from single manufacturer.

2.2 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2.3 DISTRIBUTION TRANSFORMERS

A. Comply with the following standards:

1. NEMA ST 20, Dry-Type Transformers for General Applications.
2. UL 1561, Standard for Safety Dry-Type General Purpose and Power Transformers.
3. US Department of Energy Efficiency Standards for Low Voltage Distribution Transformers.

B. General Description:

1. Dry type, two winding. Configuration, kVA, and voltage shown on Drawings.
2. Windings: Copper, unless noted otherwise herein.
3. Temperature Rise: 80 degrees C, unless noted otherwise herein.

C. Taps for transformers 15 kVA and larger: Full capacity, two 2.5 percent above and four 2.5 percent below.

D. Grounding: Provide ground-bar kit or a ground bar installed on the inside of the transformer enclosure.

E. Enclosures:

1. Indoor: NEMA 250, Type 1 or 2, ventilated. Standard enclosure type.
2. Outdoor and indicated as NEMA 3R on drawings: Indoor unit converted to Type 3R with manufacturer’s weather shielding accessory.
3. Outdoor and indicated as NEMA 4X on drawings: TENV, stainless steel enclosure. All stainless steel hardware. Manufacturer’s standard windings and temperature rise.

F. Special Options: Electrostatic shielding, K-Rated, harmonic-mitigating, or low sound level rating, where noted on Drawings.

G. Accessories:

1. Vibration isolators for transformers rated 112.5 kVA and higher.
2. Wall or ceiling brackets for wall or ceiling mount, where noted on Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for transformers.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's published instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify the grounding electrode system is present and complies with Section 260526 "Grounding and Bonding for Electrical Systems". Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1 “Standard for Good Workmanship in Electrical Construction” and NECA 409 “Standard for Installing and Maintaining Dry-Type Transformers”.

B. Comply with manufacturer’s published instructions.

C. Install mounting brackets, concrete pads, hangers, and other supports prior to setting transformers in place.

D. Install transformers level and plumb. Install vibration isolators between transformer enclosure and supports in accordance with manufacturer’s instructions.

E. Anchor floor mounted transformer to concrete base. Remove shipping braces and adjust internal mounting bolts and hardware in accordance with manufacturer’s instructions.

F. Install flexible conduits to minimize vibration transmission.

G. Ground this separately derived system in accordance with Section 260526 “Grounding and Bonding for Electrical Systems”. Terminate all grounding and bonding conductors on a common equipment grounding terminal mounted inside the transformer enclosure. Do not allow grounding terminal bar to block ventilation openings.

H. Tighten electrical connectors and terminals in accordance with manufacturer’s published torque-tightening values. If manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

I. Identify transformers in accordance with Section 260553 “Identification for Electrical Systems”.

1. Identify equipment by name designation and fed from source with nameplates.
2. Color code wiring.
3. Identify branch circuit phase and neutral wires by circuit number at TPA.
4. Provide as built type panel directory at TPA.

J. Install Arc Flash Labels in accordance with Section 260573 “Power System Studies”.

3.3 FIELD QUALITY CONTROL

A. Perform checkout and testing activities recommended by and in accordance with manufacturer's instructions, NETA ATS, and as specified herein. Correct deficiencies, make adjustments, and retest until requirements are met.

B. Visual and Mechanical Inspection:

1. Compare equipment nameplate data with Drawings and Specifications.
2. Inspect physical and mechanical condition.
3. Inspect anchorage, alignment, and grounding.
4. Verify resilient mounts are free and shipping brackets are removed.
5. Verify unit is clean.
6. Inspect bolted electrical connections for high resistance using one of the following:

    a. A low-resistance ohmmeter.
    b. Calibrated torque wrench.
    c. Thermographic survey.

7. Verify as-left tap connections are as specified.

C. Electrical Tests:

1. Perform insulation-resistance tests for winding-to-winding and winding-to-ground.
2. Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.

D. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of transformer connections.

1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
2. Perform follow-up infrared scan of transformers, at 11 months after Substantial Completion.
3. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

E. Voltage Recording: Record transformer secondary voltage at each unit under loaded conditions for at least 48 hours of typical occupancy.

1. Submit summary written report.
2. Include the following for each transformer:

    a. Designation.
    b. Nominal secondary voltage.
    c. Existing tap setting.
    d. Available tap settings.
    e. Steady state maximum secondary voltage recorded.
    f. Steady state minimum secondary voltage recorded.
    g. Time period duration.

h. Graphical representation of voltage over time period.

3.4 ADJUSTING

A. Adjust tap settings when directed by Engineer.

3.5 CLEANING

A. Remove rubbish and debris from inside and around equipment. Vacuum clean interior.

END OF SECTION 262200

SECTION 262413 - SWITCHBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Low voltage, dead front switchboards, components, and accessories.
2. Spares and spaces in equipment as indicated on the Drawings.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
3. Section 260573 “Power System Studies” for short circuit, coordination, and arc flash. The preliminary short circuit study submittal must be approved by the Engineer prior to review of the switchboard submittal.
4. Section 260800 “Commissioning of Electrical Systems” for startup and commissioning of switchboards.

1.3 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include descriptive bill of materials, literature, and catalog cut sheets of components and accessories.
2. Include time-current characteristic curves for overcurrent protective devices. Include selectable ranges for each type of overcurrent protective device.

B. Shop Drawings: For each switchboard.

1. Include drawing index.
2. Include dimensioned plans and elevations, sections, and details, including required clearances and service space around equipment.
3. Indicate shipping sections, and weights of each assembled section. Show major components and features on elevations. Show locations for conduit entrances, anchor bolts, and leveling channels on plans.
4. Include assembly ratings including enclosure type, short circuit, voltage, current, and bus material.
5. Include tabulation of rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
6. Include cable terminal lug sizes.
7. Include wiring and schematic diagrams for power, signal, and control wiring.
8. Include nameplate information.
9. Where applicable, include busway connection details, key interlock schemes, sequence of operations, composite floor plans of close-coupled assemblies, and utility metering compartment details.

C. Installation Instructions: For switchboard and major component assembly.

D. Specification Compliance:

1. Include a copy of this specification confirming compliance with each paragraph. For deviations, provide detailed commentary to explain the deviation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Seismic Qualification Data: Certificates, for switchboards, accessories, and components, from manufacturer.

1. Certificate of compliance.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based, and their installation requirements.

C. Source quality-control reports.

D. Field quality-control reports.

E. Sample Warranty: For special warranty.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For switchboards and accessories to include in emergency, operation, and maintenance manuals.

1. Include the following:

a. Routine maintenance requirements for switchboards and installed components.
b. Manufacturer's instructions for testing and adjusting circuit breaker trip settings.
c. Time-current curves, including selectable ranges for each type of overcurrent protective device. Include selectable ranges for each type of overcurrent protective device.
d. "As-Built" shop drawings incorporated during construction by manufacturer or Contractor. Provide drawings in AutoCAD native file format.
e. "As-Left" settings for adjustable devices such as timers and overcurrent protective devices.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Potential Transformer Fuses: Equal to 10 percent of quantity installed for each size and type but no fewer than two of each size and type.
2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Rating Plug and Trip Units: one of each size and type.
4. Indicating Lights (lamp and lens cap): Two of each type and color installed.
5. One dozen each of cover bolts, spring nuts and door fasteners.

B. Touchup paint: half-pint container of paint matching the enclosure exterior finish**.**

C. One full function portable solid state circuit breaker test set for calibration performance of circuit breaker microprocessor trip unit functions using secondary current injection testing. Include ground defeat cable for trip units to allow for primary current testing, if necessary.

1.8 QUALITY ASSURANCE

A. Testing Agency Qualifications: Accredited by NETA.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Comply with the following for delivery, storage, and handling:

1. Manufacturer's instructions.
2. Section 260010 "Supplementary Requirements for Electrical".
3. NECA 400 "Standard for Installing and Maintaining Switchboards".
4. ANSI/NEMA PB 2.1 "General Instructions for Proper Handling, Installation, Operation, and Maintenance of Deadfront Distribution Switchboards Rated 1000 Volts or Less".

© 2026 CDM Smith
All Rights Reserved

1.10 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace switchboards and accessories that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to equipment manufacturer restrictions listed in Section 260010 “Supplemental Requirements for Electrical”, switchboards from the following manufacturers are approved:

1. ABB.
2. Eaton.
3. Schneider Electric / Square D.
4. Siemens.

B. Source Limitations: Obtain switchboards from single source from single manufacturer.

C. Modifications or Additions to Existing Switchboards: Use original manufacturer for model series still in production; otherwise use original manufacturer or approved manufacturer with documented prior experience providing similar types of modifications.

2.2 GENERAL REQUIREMENTS

A. Low voltage switchboard assembly, free-standing, dead-front type, ANSI / NEMA rated, and UL 891 labeled for installation on low voltage electrical distribution system indicated on Drawings. General arrangement, alignment, ratings, and major components of switchboards are shown on the Drawings.

B. Fully rate main and feeder circuit breakers for the specified short circuit duty. Systems employing series ratings are unacceptable.

C. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

D. Comply with the following standards as applicable:

1. NEMA PB 2, Dead-front Distribution Switchboards.
2. UL 489, Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures.
3. UL 891, Switchboards, CCN WEVZ.
4. UL 1066, Power Circuit Breakers up to 1000 V AC and 1500 V DC Used in Enclosures.
5. UL 1449, Surge Protective Devices.

E. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchboards including clearances between switchboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

F. Temperature: Design switchboards and devices for continuous operation at rated current with a 40 degrees Celsius ambient temperature.

2.3 SYSTEM DESCRIPTION

A. SWBD-RTU-BUS A & SWBRD-RTU-BUS B:

1. Front access only, front and rear aligned, individually sections for main breaker, and tie breaker, group mounted feeder sections. Eaton Pow-R-Line Xpert or equivalent.

2.4 CONSTRUCTION

A. Construct switchboard with required number of vertical sections bolted together to form a rigid assembly. Cover sides and rear with removable bolt-on covers. Form edges of front covers or hinged front panels. Provide adequate ventilation.

B. Align sections of switchboard as indicated on Drawings.

C. Provide switchboard assembly with adequate lifting means.

D. Indoor Enclosure: NEMA Type 1 enclosure unless otherwise indicated on drawings.

E. Maximum Dimensions: As indicated on drawings. Comply with NEC height limit of operating handles when switchboard is installed on 4-inch-high housekeeping pad.

F. Exterior Enclosure Finish: Factory-applied finish in manufacturer's standard color over a rust-inhibiting primer on treated metal surface.

G. Interior Enclosure Finishes:

1. Control and power cell compartment: high gloss white for easier visibility.
2. Unpainted steel parts, plated for corrosion resistance.

H. Barriers: Between adjacent switchboard sections.

I. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments. Use captive quarter turn fasteners.

J. When wires or buswork passes through holes or sections, add suitable guarding or grommets for close fit and to prevent cutting or chafing of insulation.

K. Where Drawings indicate space for future overcurrent protective devices, equip space with so only the overcurrent protective device is needed to be added. Include buswork, barriers, connections, protective device mounting hardware, doors/covers, etc. required.

L. Bus Systems:

1. Phase Bus Arrangement: A, B, C from front to back, top to bottom, and left to right when viewed from front of switchboard.
2. Phase and Neutral Bus: Tin plated copper, bolted joints, fully rated throughout the lineup. Tapered bus is not allowed. Braced for 65,000 A rms unless otherwise noted on Drawings. Full size neutral bus for four wire systems if indicated on Drawings.
3. Ground Bus: Minimum 1/4-inch by 2-inch, tin plated copper uninsulated ground bus, extended through each section.
4. Disconnect Links: Isolate neutral bus from incoming neutral conductors. Bond neutral bus to equipment ground bus for switchboards utilized as service equipment or separately derived systems.

M. Wiring/Terminations:

1. Instrument and Control Wire: Stranded copper, type SIS, bundled and secured with nylon ties. Minimum size No. 14 AWG.
2. Control Wire Terminations: Insulated locking spade terminals, except where saddle type terminals are provided integral to device. Current transformer secondary leads must connect to shorting type terminal blocks before connecting to another device.
3. Provide numbered terminal blocks for landing control wiring that leaves the switchboard.
4. Power Terminations: Mechanical type, suitable for 75 or 90 degrees C, copper or aluminum cable of the size indicated on Drawings.

N. Where Drawings indicate utility metering is required, provide separated barriered utility metering compartment complete with hinged sealable door, provisions for mounting utility's metering instruments, and in compliance with the specific utility requirements. Provide service entrance label and appliable service entrance features per NEC and local code requirements.

2.5 CIRCUIT BREAKERS

A. Circuit breakers 800 A frame and larger: 600 V, insulated-case type, listed and labeled to UL 489, 80 percent continuous ampacity, fixed mount, electrically operated. Temperature insensitive, true RMS, integral, fully adjustable solid state electronic trip unit with the following features:

1. Independently adjustable long-time pick-up and delay.
2. Independently adjustable short-time pick-up, delay, and I^2t settings.
3. Adjustable instantaneous pick-up.
4. Independently adjustable ground fault pick-up, delay and I^2t settings.
5. Trip mode targets for overload, short circuit and ground fault.
6. Long-time pick-up light.

B. Circuit breakers 400 A and 600 A frame: 600 V, molded-case type, listed and labeled to UL 489, 80 percent continuous ampacity rated. Temperature insensitive, true RMS, integral, fully adjustable solid state electronic trip unit with the following features:

1. Independently adjustable long-time pick-up and delay.
2. Independently adjustable short-time pick-up, delay, and I^2t settings.
3. Adjustable instantaneous pick-up.
4. Independently adjustable ground fault pick-up, delay and I^2t settings.
5. Trip mode targets for overload, short circuit and ground fault.

6. Long-time pick-up light.

C. Circuit breakers 250 A and 400 A frame: 600 V, molded-case type, listed and labeled to UL 489, 80 percent continuous ampacity rated. Temperature insensitive, true RMS, integral, fully adjustable solid state electronic trip unit with the following features:

1. Independently adjustable long-time pick-up and delay.
2. Adjustable instantaneous pick-up.
3. Independently adjustable ground fault pick-up, delay and I^2t settings.
4. Trip mode targets for overload, short circuit and ground fault.
5. Long-time pick-up light.

D. Circuit breakers 225 A frame and less: 600 V, molded-case type, listed and labeled to UL 489, 80 percent continuous ampacity rated. Thermal magnetic trip.

2.6 IDENTIFICATION

A. Signs and Nameplates: Engraved, laminated plastic, stainless steel screw attachment, background color and letters as noted herein.

B. Master Nameplate: Switchboard designation, service ratings, factory order number, and date (month/year) of manufacture. Lettering not less than 3/8-inch high, black background, white letters. Locate at top of switchboard section containing incoming feed.

C. Unit Compartment or Breaker Nameplates: Designation as indicated on drawings. Lettering not less than 3/8-inch high, black background, white letters.

D. Identify pilot devices and operators using legend plates or nameplates.

E. Identify internal components, corresponding to wiring diagrams.

F. Include warning labels on terminals that are energized with the power disconnect OFF.

G. Control Wire Identification: Typed sleeve type labels at each end, corresponding to wiring diagrams. Wiring less than six inches may be numbered at only one end. Identify foreign voltage control wiring with yellow wires.

2.7 SURGE PROTECTION

A. Integral Surge Protective Device: To protect input AC line from transients.

1. By switchboard manufacturer, factory installed, with integral disconnect.
2. Type 2.
3. SCCR: Equal to SCCR of switchboard.
4. Performance and Features: Comply with Section 264313 “Surge Protection for Low-Voltage Electrical Power Circuits”.

© 2026 CDM Smith
All Rights Reserved

2.8 INSTRUMENTATION AND METERING

A. Current Transformers: 600 V, 5 A secondary, bar or window type, single secondary winding and secondary shorting device and in compliance with IEEE C57.13. Burden and accuracy shall be consistent with connected metering and relay devices.

B. Control Power Transformers: Two winding type, 120 Vac secondary, sized for additional load where indicated. Furnish fused primary and secondary, and bond unfused leg of secondary to enclosure. Mount in separate compartments for units larger than 3 kVA.

C. Digital Metering (Power Monitors): Provide as indicated on Drawings. Schneider Electric PowerLogic PM5000 Series or equal for basic multi-functioning metering and power quality analysis. Locate top of power quality meter cubicle at 60-inches from bottom of switchboard, plus or minus 6-inches.

2.9 ADDITIONAL FEATURES

A. Key interlocks as indicated on Drawings.

B. Energy-reducing maintenance switch with local status indication LED pilot light for circuit breakers rated 1200 A and higher.

2.10 NETWORK COMMUNICATIONS

A. Digital communication signal will utilize copper Ethernet cable using Modbus TCP/IP communications protocol.

2.11 SOURCE QUALITY CONTROL

A. Test and inspect equipment according to UL, NEMA, and manufacturer.

B. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Upon delivery of switchboard and prior to unloading, inspect equipment for damage.

B. Examine areas and surfaces to receive switchboard, with Installer present, for compliance with requirements for installation tolerances, and other conditions affecting performance of the Work.

C. Verify that ground connections are in place and that requirements in Section 260526 “Grounding and Bonding for Electrical Systems” have been met.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

© 2026 CDM Smith
All Rights Reserved

3.2 INSTALLATION

A. Comply with manufacturer's published instructions.

B. Reference Standards for Installation: Unless more stringent installation requirements are specified in Contract Documents or manufacturer's published instructions, comply with the following:

1. NECA NEIS 400 – Standard for Installing and Maintaining Switchboards.
2. NEMA PB 2.1 – General Instructions for Proper Handling, Installation, Operation, and Maintenance of Deadfront Distribution Switchboards Rated 1000 Volts or Less.

C. Provide equipment housekeeping pads as detailed on the Drawings.

D. Bolt switchboard floor sills directly to finished floor or equipment pad. Make structure level, plumb, and secure. Use 1/2-inch (minimum) anchor bolts. Provide necessary hardware and shims.

E. Remove temporary lifting angles, lugs, and shipping braces. Touch up damaged paint finishes.

F. Conduit entering or leaving switchboard from underground is to be stubbed up into section in which the conductors are to be terminated. Likewise, when conduits enter the top of the switchboard, enter the corresponding section. Do not enter the switchboard from the side unless approved in writing by the Engineer.

G. Grounding and Bonding:

1. Bond equipment ground bus to grounding electrode system as shown on Drawings.
2. Bond all conduits including stub-ups to the equipment ground bus.

H. Install conduits to prevent water from entering enclosure. Seal voids around conduit stub-ups.

I. Neatly group field installed interior wiring by circuit using plastic tie wraps. Support circuit groups to avoid stress at terminations.

J. Make wiring interconnections between shipping splits. Install bus splice plates.

K. Tighten bolted connections and wiring connections using calibrated torque wrench or torque screwdriver per manufacturer's written instructions.

L. Obtain the manufacturer's services for the commissioning and startup work.

3.3 IDENTIFICATION

A. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems".

1. Identify equipment by name designation and fed from source nameplates.
2. Identify field-installed conductors, interconnecting wiring, and components.

B. Install Arc Flash Labels in accordance with Section 260573 "Power System Studies".

© 2026 CDM Smith
All Rights Reserved

3.4 FIELD QUALITY CONTROL

A. Division of Responsibilities:

1. Provide installation and assist with all testing and startup activities.
2. Engage factory authorized service representative to assist in installation, inspection, testing, startup, and commissioning activities specified herein to active manufacturer's warranty.
3. Engage a qualified testing agency as defined in this Section to perform activities defined in Section 260800 "Commissioning of Electrical Systems".

B. General Requirements:

1. Perform inspection, testing, and startup activities recommended by and in accordance with manufacturer's instructions, NETA ATS, and as specified herein.
2. Perform testing and test methods in compliance with NFPA 70B.
3. Optional NETA ATS tests are not required unless specifically called for in this specification or the manufacturer's instructions.
4. Provide materials and labor as necessary.
5. Correct deficiencies, adjust, and retest until requirements are met.
6. Provide written report for each field testing or service visit.

C. Visual and Mechanical Inspection:

1. Confirm equipment and devices conform to approved shop drawings.
2. Inspect physical and mechanical condition.
3. Inspect anchorage, alignment, and grounding. Adjust compartment doors as required.
4. Verify tightness of accessible bolted electrical connections. Use calibrated torque wrench.
5. Verify unit is clean.
6. Verify smooth and correct operation of mechanical devices: circuit breakers, interlocks, etc.

D. Electrical Tests:

1. Insulation resistance test of bus, phase to phase and phase to ground after disconnecting devices sensitive to test voltage.
2. Check polarity and continuity of metering and relaying circuits.
3. Test ground connections for continuity and resistance.
4. Test protective devices and equipment as recommended by manufacturer.
5. Verify correct input and output voltages, currents, and phase rotations.

E. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard.

1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
2. Perform follow-up infrared scan of equipment, at 11 months after Substantial Completion.
3. Prepare a certified report identifying equipment checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

F. Switchboards will be considered defective if they do not pass tests and inspections.

3.5 STARTUP AND COMMISSIONING SERVICE

A. Engage a factory-authorized service representative to perform startup and system commissioning service to verify complete and correct operation of sensing devices, alarms, indicating devices, and communication to plant SCADA system.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Field test hardwired discrete and analog connections and any digital communication signals connected to verify proper operation locally and at the plant SCADA system.

B. Adjust protective devices in accordance with the final approved submittal of Section 260573 “Power System Studies”.

3.6 DEMONSTRATION AND TRAINING

A. Engage a factory-authorized service representative to demonstrate correct operation, adjust settings, and maintain switchboards to Owner.

B. Provide 8-hour man day[s] for instruction. Time instruction to cover all working shifts.

3.7 CLEANING

A. Remove rubbish and debris from inside and around the equipment. Remove dirt, dust, or concrete spatter from the interior and exterior of the equipment using brushes, vacuum cleaner, or clean, lint-free rags. Do not use compressed air.

SECTION 262416 - PANELBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Power panelboards.
2. Lighting and appliance branch circuit panelboards.
3. Load centers.
4. Circuit breakers.
5. Accessories and special construction.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.
3. Section 264313 “Surge Protection for Low-Voltage Electrical Power Circuits” for performance requirements of factory installed SPDs.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product used on project. Note this Section may include products not required for the project.

1. Include materials, switching and overcurrent protective devices, SPDs, accessories, and components indicated.
2. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each panelboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details.
2. Show tabulations of installed devices with nameplates, conductor termination sizes, equipment features, and ratings.
3. Detail enclosure types including mounting and anchorage, environmental protection, knockouts, corner treatments, covers and doors, gaskets, hinges, and locks.

4. Detail bus configuration, current, and voltage ratings.
5. Short-circuit current rating of panelboards and overcurrent protective devices.
6. Include evidence of listing, by qualified electrical testing laboratory recognized by authorities having jurisdiction, for SPD as installed in panelboard.
7. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
8. Include wiring diagrams for power, signal, and control wiring.
9. Key interlock scheme drawing and sequence of operations.
10. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Include Internet link for electronic access to downloadable PDF of coordination curves.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. Include the following:

1. Manufacturer’s written instructions for testing and adjusting overcurrent protective devices.
2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

B. Warranty documentation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to equipment manufacturer restrictions listed in Section 260010 “Supplemental Requirements for Electrical”, panelboards from the following manufacturers are approved:

1. Eaton.
2. GE by ABB.
3. Siemens.
4. Square D by Schneider Electric.

B. Source Limitations:

1. Obtain new panelboards from single source from single manufacturer.
2. Obtain retrofit disconnecting and overcurrent protective devices from existing panelboard manufacturer or subsequent responsible manufacturer, to maintain overall UL listing of panelboard.

© 2026 CDM Smith
All Rights Reserved

2.2 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by qualified electrical testing agency recognized by authorities having jurisdiction, and marked for intended location and application.

B. Comply with the following standards as applicable:

1. NEMA PB 1, Panelboards.
2. UL 50, Enclosures for Electrical Equipment, Non-Environmental Considerations.
3. UL 50E, Enclosures for Electrical Equipment, Environmental Considerations.
4. UL 67, Standard for Panelboards, CCN QEUY.
5. UL 489, Standard for Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures.
6. UL 1449, Surge Protective Devices.

C. Ratings:

1. Ratings are indicated on the Drawings.
2. Series rated panelboards are prohibited. Circuit breakers must be fully rated for the short circuit rating listed for the panelboard.

D. Construction:

1. NEMA12 enclosure, unless noted otherwise on Drawings. See ACCESSORIES AND SPECIAL CONSTRUCTION Article for enclosures other than NEMA 12.
2. Copper equipment grounding bar, separate and distinct from neutral bar.
3. Conductor Lugs:

    a. Mechanical type.
    b. Size suitable for indicated conductor sizes.
    c. Neutral (when present) and ground lug quantity equal to each pole in panelboard.

4. Where Drawings indicate space for future circuit breaker, equip panelboard with bus bars, blank covers, and mounting hardware so only the future breaker need be provided.

E. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearance between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

2.3 POWER PANELBOARDS

A. Manufacturer’s power distribution panelboard using molded-case bolt-on circuit breakers, where available. Drawing designation using “PP” or “DP”.

B. Doors: Hinged cover or door-in-door trim when available. Secure door with flush keyed lock and catch, except doors over 36 inches in height to use a vault-type latch with tumbler lock and 3-point catch. All locks keyed alike.

C. Bus: Tin-plated copper.

2.4 LIGHTING AND APPLIANCE BRANCH CIRCUIT PANELBOARDS

A. Manufacturer's lighting and appliance panelboard using molded-case bolt-on circuit breakers.

B. Doors: Door-in-door construction with concealed hinges; secured with flush keyed lock and catch, except doors over 48 inches in height to use a vault-type latch with tumbler lock and 3-point catch. All locks keyed alike.

C. Bus: Tin-plated copper.

2.5 LOAD CENTERS

A. Manufacturer's load center using molded-case plug-on circuit breakers.

B. Load center type construction when indicated on Drawings.

C. Doors: Concealed hinges secured with flush latch with tumbler lock; keyed alike.

2.6 CIRCUIT BREAKERS

A. Molded case, manufactured by panelboard manufacturer.

B. Plug-in or bolt-on as listed in associated panelboard Article.

C. Configuration, frame size, trip, and special features such as GFCI (Class A trip, 4-6 mA) or GFI (Class B trip, 30 mA) as shown on Drawings.

D. Provide breaker lugs to accommodate wire sizes shown on Drawings.

E. Multi-pole breakers to have common trip. Do not convert single pole breakers to multi-pole using handle ties, use multi-pole breaker.

F. Thermal-Magnetic Circuit Breakers:

1. Inverse time-current element for low-level overloads.
2. Instantaneous magnetic trip element for short circuits.
3. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

G. Electronic Trip Circuit Breakers:

1. RMS sensing.
2. Field-replaceable rating plug or electronic trip.
3. Adjustable trip functions as indicated on Drawings.

2.7 ACCESSORIES AND SPECIAL CONSTRUCTION

A. Accessories such as breaker lockout devices or key interlocks are indicated on the Drawings.

B. Integral Surge Protective Device:

1. By panelboard manufacturer, factory installed.
2. Type 2.
3. SCCR: Equal to SCCR of panelboard where installed.
4. Performance: Comply with Section 264313 “Surge Protection for Low-Voltage Electrical Power Circuits”.

C. Electronic Grade:

1. Integral SPD.
2. Neutrals: 200 percent rated.

D. NEMA 3R Enclosure:

1. Material: galvanized steel.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify actual conditions with field measurements prior to ordering panelboards to verify that equipment fits in allocated space in, and comply with, minimum required clearances specified in NFPA 70.

B. Examine panelboards before installation. Reject panelboards that are damaged, rusted, or have been subjected to water saturation.

C. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer’s published instructions.

B. Reference Standards for Installation: Unless more stringent requirements are specified in Contract Documents or manufacturer’s published instructions, comply with the following:

1. ANSI/NEMA PB 1.1 – General Instructions for Proper Installation, Operation, and Maintenance of Panelboards Rated 600 Volts or Less.
2. NECA NEIS 407 – Standard for Installing and Maintaining Panelboards.

C. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

D. Equipment Mounting:

1. Attach panelboard to the vertical finished or structural surface behind panelboard.
2. Mount back box plumb and level, and surface or flush mount as indicated on Drawings.
3. Mount surface-mounted panelboards to supports to allow a minimum of 1/2 inch air space between the box and the mounting surface.
4. Mount flush-mounted panelboards with front cover uniformly flush with wall finish and mating with back box.
5. Mount top of trim 72 inches above finished floor unless otherwise indicated.

E. Install circuit breakers not already factory installed. Rearrange circuit breakers to correspond to panel schedules shown on Drawings.

F. Tighten bolted connections and wiring connections using calibrated torque wrench or torque screwdriver per manufacturer's written instructions.

G. Install filler plates in unused spaces.

H. Plug abandoned or unused entry holes.

I. Do not leave cut off wires at breakers, neutral bar terminal, or ground bar terminal.

J. Identify panelboards in accordance with Section 260553 "Identification for Electrical Systems".

1. Identify equipment by name designation and fed from source nameplates.
2. Identify pole numbers.
3. Color code wiring.
4. Identify branch circuit phase and neutral wires by circuit number.
5. Provide as built typed panelboard directory.

K. Adjust circuit breakers with adjustable trips in accordance with the final approved submittal of Section 260573 "Power System Studies".

L. Install Arc Flash Labels in accordance with Section 260573 "Power System Studies".

3.3 FIELD QUALITY CONTROL

A. Perform checkout and testing activities recommended by and in accordance with manufacturer's instructions, NECA 407, and as specified herein. Correct deficiencies, make adjustments, and retest until requirements are met.

B. Visual and Mechanical Inspection:

1. Compare equipment nameplate data with Drawings and Specifications.
2. Inspect physical and mechanical condition.
3. Inspect anchorage, alignment, and grounding.
4. Verify unit is clean.
5. Verify breakers operate smoothly.

C. Electrical Tests:

1. Perform insulation resistance test on buswork in accordance with manufacturer's instructions.

2. Verify correct voltage and phasing at each panelboard.
3. Verify load currents are balanced across the three phases.

D. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of panelboard connections for new or modified panelboards.

1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
2. Perform follow-up infrared scan of panelboards, at 11 months after Substantial Completion.
3. Prepare a certified report identifying panelboard checked and describing results of scanning. Include a notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

3.4 CLEANING

A. Remove rubbish and debris from inside and around equipment. Vacuum clean interior.

SECTION 262505 – 480V CONTROL PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes industrial control panels with the following features:

1. Enclosure.
2. Main circuit breaker.
3. Motor controllers.
4. Control and monitoring devices.
5. Accessories.
6. Identification.

B. Related Requirements:

1. Section 260010 “Supplemental Requirements for Electrical” for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 “Facility Performance Requirements for Electrical” for seismic-load, wind-load, acoustical, and field conditions applicable to Work specified in this Section.
3. Division 26 for electrical work.
4. Division 27 for communications wiring.
5. Division 40 for process automation requirements.

1.3 DEFINITIONS

A. CPT: Control power transformer.

B. GFCI: Ground-fault circuit interrupter.

C. MCCB: Molded-case circuit breaker.

D. MCP: Motor circuit protector.

E. NEC: National Electrical Code.

F. RVSS: Reduced voltage soft start.

G. RVAT: Reduced voltage autotransformer start.

H. SCCR: Short-circuit current rating.

I. SPD: Surge protective device.

J. UL: Underwriter’s Laboratories.

K. VFC: Variable frequency motor controller. See VFD.

L. VFD: Variable frequency drive. Used interchangeably with the term VFC.

1.4 ACTION SUBMITTALS

A. Product Data: For each control panel.

1. Include materials, switching and overcurrent protective devices, SPDs, accessories, and components indicated.
2. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each control panel.

1. Include dimensioned plans, elevations, sections, and details.
2. Bill of materials with part numbers, cross-referenced to plans.
3. Nameplate schedule.
4. Conduit entrance locations and mounting details.
5. Power and control schematics.
6. Certification for compliance with UL 508A.
7. Identification per NEC 409.110.

1.5 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Data: Certificates, from manufacturer.

B. Startup reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following if applicable:

1. Manufacturer's written instructions for testing and adjusting thermal-magnetic circuit breaker and motor-circuit protector trip settings.
2. Manufacturer's written instructions for setting field-adjustable overload relays.
3. Manufacturer's written instructions for testing, adjusting, and reprogramming microprocessor control modules.
4. Manufacturer's written instructions for setting field-adjustable timers, controls, and status and alarm points.

5. Load-Current and Overload-Relay Heater List: Compile after motors have been installed and arrange to demonstrate that selection of heaters suits actual motor nameplate, full-load currents.
6. Load-Current and List of Settings of Adjustable Overload Relays: Compile after motors have been installed and arrange to demonstrate that switch settings for motor-running overload protection suit actual motors to be protected.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Control fuses: Equal to 10 percent of total quantity installed for each size and type, but no fewer than two of each size and type.
2. Power fuses: Equal to 10 percent of total quantity installed for each size and type, but no fewer than three of each size and type.
3. Corrosion Inhibitor: Equal to 100 percent of total number of control panels. (One spare per panel.)

1.8 QUALITY ASSURANCE

A. Testing Agency Qualifications: Accredited by NETA.

1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Store control panels indoors in clean, dry space with uniform temperature to prevent condensation. Protect control panels from exposure to dirt, fumes, water, corrosive substances, and physical damage.

B. If stored in space that is not permanently enclosed and air conditioned, remove loose packing and flammable materials from inside enclosures and install temporary electric heating, with at least 50 W per enclosure.

1.10 FIELD CONDITIONS

A. Ambient Environment Ratings: Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not less than 23 deg F and not exceeding 104 deg F.
2. Altitude: Not exceeding 6600 feet for electromagnetic and manual devices.

1.11 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace control panels that fail in materials or workmanship within specified warranty period.

B. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace SPD that fails in materials or workmanship within specified warranty period.

1. SPD Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Fabricate and test panelboards according to IEEE 344 to withstand seismic forces.

B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for control panels clearances between control panels and adjacent surfaces and other items. Comply with indicated maximum dimensions.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Comply with NEMA 250: Enclosures for Electrical Equipment (1000 Volts Maximum).

E. Comply with NEMA ICS 6: Industrial Control and Systems: Enclosures.

F. Comply with UL 1203 for control panels located in hazardous (classified) locations.

G. Comply with NFPA 70.

H. Comply with UL 508A.

I. Complete and fully functional control to manually or automatically operate the control system as specified herein and in other applicable sections of these specifications. Include manufacturer’s recommended safety devices to protect operators. All control devices, unless specified otherwise, mounted in the Control Panel.

J. The control panel shall operate on a power supply of 480 volts, 3-phase, 60 hertz unless otherwise noted.

K. Control panel consists of a main circuit breaker, motor circuit protector (MCP) and motor controller for each motor, and a 120-volt control power transformer (fused on primary and secondary) along with other devices specified. Mount all control components in one common enclosure.

L. Operation of motors will be manually or automatically. Stager control of multiple motors to prevent simultaneous motor starting.

M. All electronic control equipment (i.e. controllers, isolators, signal boosters, transmitters, PLC's, etc.) shall be as specified in Division 40.

N. Control panels containing PLC’s shall contain UPS or battery ride-through for the PLC in accordance with Division 40 specifications.

O. SCCR: Control panels with main breakers of 125 amps or less shall have SCCR of 35kA, unless specifically noted elsewhere.

2.2 ENCLOSURES

A. Enclosures: Surface-mounted, dead-front cabinets rated for environmental conditions at installed location. Unless noted elsewhere, NEMA rating shall be NEMA 4X, Type 316 stainless steel, minimum 14 gauge.

B. Construction: The door shall be mounted via continuous stainless steel hinged and provided with a pad-lockable vault type 3-point latch. The enclosure shall be equipped with a door and shall incorporate a removable back panel on which control components shall be mounted. Back panel shall be secured to enclosure with collar studs. Door(s) shall be interlocked with main circuit breaker and provided with pad-locking provision.

C. All motor branch circuit breakers, motor starters and control relays shall be of highest industrial quality, securely fastened to the removable back panels with screws and lock washers. Back panels shall be tapped to accept all mounting screws. Self-tapping screws shall not be used to mount any component.

D. Operating handle for main circuit breaker: flange mounted.

E. Outdoor enclosures shall be provided with sun shields. Install sun shields on fronts, sides, and tops of enclosures subject to direct and extended sun exposure.

F. Provide additional temperature control if required to meet UL temperature rating of internal components. If forced air ventilation is required, the enclosure shall be pressurized. Air filters shall be of commercially available types and sizes.

G. All operating control and instruments shall be securely mounted on the exterior door. All controls and instruments shall be clearly labeled to indicate function. All exterior mounted equipment shall be NEMA 4X.

H. Print storage pockets shall be provided on the inside of each panel. Pocket shall be of sufficient size as required to hold all prints necessary to service the equipment.

I. Where the project has multiple control panels, suggest including a table of SCCR requirements for the paragraph below – design engineer to perform short circuit calculations to confirm.

2.3 COMPONENTS

A. Main Breaker: Thermal-magnetic air circuit breaker, Schneider Electric/Square D PowerPact Type BG (125 amp frame, 35kAIC) or equal.

B. MCP: Molded case motor circuit protector with adjustable magnetic trip only, Schneider Electric/Square D “Mag-Gard” or equal.

C. Motor Controller:

1. Full Voltage Motor Starting: Open frame, across-the-line, NEMA-rated magnetic motor starter, Schneider Electric/Square D Class 8536 or equal. Solid state overloads with Class 10/20 selectable tripping. Submersible motors shall use Class 10 trip curve.

D. Overload relays shall be self-powered solid-state type and provide the following features: tamper guard over trip adjustment setting, ambient insensitive, harmonic immunity, phase loss and phase unbalance protection, manual reset, and push-to-test.

E. Overload reset buttons shall be mounted on dead front door.

F. Normally open and normally closed auxiliary motor overload contacts wired to terminal blocks shall be provided for each motor starter within the control panel.

G. SPD: The control panel shall be provided with a surge protective device (SPD) rated for 100kA per mode for the incoming power. SPD shall be mounted within the control panel enclosure. Lead lengths shall not be longer than 12 inches from the main circuit breaker.

H. Control Power Transformer: 480-120V CPT, fused on primary and secondary sides, capacity as required.

2.4 CONTROL DEVICES AND ACCESSORIES

A. Control Operators and Indictors:

1. Heavy duty type, full size (30.5mm), NEMA 4X or 7 as required.
2. Each motor shall include Hand-Off-Auto selector switches to permit override of automatic control and manual actuation of shutdown.

B. Indicating Lights:

1. LED, full size (30.5mm), full voltage and push-to-test type.
2. Indicators shall be provided for individual motor run and an indicator for each failure condition.

C. Elapsed Time Meters (ETM):

1. Six (6) digit, non-reset elapsed time meter to indicate the total running time of each motor in "hours" and "tenth of hours". Series T50 as manufactured by the ENM Company or equal.
2. Provide an ETM for each motor.

D. Failure Alarm Horn and Beacon Light:

1. Alarm horn: weatherproof rated with gasket (Federal Signal Corporation, Cat. #350 or equal) for NEMA 4X applications.
2. Alarm beacon: Red lens and solid-state flasher (Ingam Products Inc. LRX-40 or equal) for NEMA 4X applications.
3. All lift station pump control panels shall include alarm horn and light for summary alarm condition.

4. Silence and reset pushbuttons shall also be furnished. A common failure reset pushbutton shall be provided to reset the alarm conditions (reset shall occur only if fault condition has been cleared).

E. Relays:

1. Control relays shall be 10 amp rated contacts (minimum), 11 pin with mounting base, 3PDT (minimum), with LED indicators to show relay status, relays shall be manufactured by Potter Brumfield or equal.
2. Timing relays shall be solid state, with pin (octal) and bases, relays shall be T-series as manufactured by Diversified Electronics Inc. or equal.
3. Intrinsically safe relays shall be solid state type with 5 amp output contacts, suitable for use on 120 volt, 60 hertz power supply and shall be Factory Mutual approved for devices in Class 1, Division 1 hazardous atmospheres. Intrinsically safe relays shall be Gems Solid State Safe-Pak as manufactured by Gems Sensors, Division of Transamerica Delaval, Inc. or equal.

F. A duplex GFCI utility receptacle (circuit breaker protected) providing 120 volts, 60 Hertz, single phase current shall be mounted on the side of the enclosure.

G. Auxiliary contacts shall be provided for remote run indication and indication of each status and alarm condition. Additional controls shall be provided as specified herein and as required by Divisions 40, 26 and as shown on the Drawings.

H. Alternators shall be provided to sequence lead/lag motors, alternators shall be 008-120-13SP or 009-120-23AP as manufactured by Sta-con, or equal.

I. A phase monitor shall be provided for the control panel, monitors shall be model SUA-440-ASA as manufactured by Diversified Electronics Inc., or equal.

J. Corrosion Inhibitor Emitter: Inclusion of an industrial corrosion inhibitor emitter, selected by the manufacturer, to protect internal components of control panel from corrosion for up to one year.

K. Breather assemblies, to maintain interior pressure and release condensation in Type 4X enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.

2.5 WIRING

A. Power and control wire shall be 600 Volt class, Type MTW insulated stranded copper and shall be of the sizes required for the current to be carried, but not smaller than No. 14 AWG. All wiring shall be enclosed in PVC wire trough with slotted side openings and removable cover.

B. Wiring shall be stranded copper, minimum size #14 AWG (except for shielded instrumentation cable), with 600 Volt, 90 degree C, flame retardant, Type MTW thermoplastic insulation.

C. All interconnecting wires between panel mounted equipment and external equipment shall be terminated at numbered terminal blocks.

D. Terminal blocks shall be 600 Volt heavy duty rated, tubular clamp type. Terminal strips shall be Allen Bradley catalog #1492-CA-1 or equal.

E. A copper ground bar with sufficient terminals for all field and panel ground connections shall be provided.

F. All signal wiring entering and exiting the control panel shall be provided with surge protection. Surge protection shall be as specified in Division 40.

G. An 8-inch (minimum) clear space within the enclosure shall be provided horizontally along the entire top and bottom of the control panel. A 4-inch (minimum) clear space within the enclosure shall be provided vertically along the entire sides of the control panel. No devices, terminals, etc. shall be installed within this space, the space shall be provided for field conduit and wiring access only.

2.6 IDENTIFICATION

A. All control panel wiring shall be numbered at both ends with type written heat shrinkable wire markers.

B. The control diagrams and overload tables shall be laminated to the inside of the door except where door space is limited the laminated documents shall be in the print storage pocket.

C. The control panel shall be provided with nameplates identifying each component, selector switches, pilot lights, etc. Nameplates shall be permanently affixed using an epoxy process (inner door nameplates shall be fastened with stainless steel screws). Nameplates shall be laminated plastic, engraved black letters with a white background.

D. All control panels shall be provided with two nameplates located on the exterior door. The first nameplate shall identify the control panel name. The second nameplate shall identify the power source.

E. Where applicable provide a nameplate which reads as follows "CAUTION - THIS PANEL CONTAINS A VOLTAGE FROM AN EXTERNAL SOURCE." Letters shall be black on a high visibility yellow background.

F. Each terminal at terminal blocks shall be individually labeled.

G. Incoming phase conductor terminals shall be clearly identified. All wiring within the control panel shall be color coded or coded using electrical tape in sizes where colored insulation is not available. The following coding shall be used.

System	**Wire**	**Color**
Incoming line voltage	Phase conductors	Black
	Ground	Green
	Neutral (as required)	Gray
Internal control voltage	AC	Red
Internal control voltage	DC	Blue
External source	All	Yellow

2.7 FACTORY TESTS

A. Inspect and test control panel for correct operation. Test each circuit for continuity, short circuits, and ground faults.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1.

B. Comply with requirements for seismic control devices specified in Section 260548.16 "Seismic Controls for Electrical Systems."

C. Inspect anchorage, alignment, grounding, and clearances.

D. Compare equipment nameplate data for compliance with Drawings and Specifications.

E. Verify that electrical wiring installation complies with manufacturer's written installation requirements.

F. Motor Overload Relays: Select and set overloads on the basis of full-load current rating as shown on motor nameplate. Adjust setting value for special motors as required by NFPA 70 for motors that are high-torque, high-efficiency, and so on.

G. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.2 STARTUP SERVICE

A. Complete startup checks according to manufacturer’s written instructions.

B. Verify motor running protection is appropriate for actual motors installed.

C. Test control panel with all field wiring connected. Set adjustable set points and time delays for proper operation of equipment. Adjust as required.

D. Perform infrared inspection of panel interior during periods of maximum possible loading. Remove all necessary covers prior to the inspection. Comply with the recommendations of NFPA 70B, "Testing and Test Methods" Chapter, "Infrared Inspection" Article.

E. Prepare test and inspection reports.

F. Install a set of legible “as built” control panel drawings (11x17 or 8.5 x 11), in the storage pocket.

3.3 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain equipment.

SECTION 262726 - WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes receptacles, toggle switches, cover plates, and cord and plug sets.

B. Related Requirements:

1. Section 260010 "Supplemental Requirements for Electrical" for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 "Facility Performance Requirements for Electrical" for seismic-load, wind-load, acoustical, and other field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product used on project. Note this Section may include products not required for the project.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing-label warnings and instruction manuals that include labeling conditions.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

B. Comply with the following standards and UL Category Control Number (CCN) listing criteria as applicable:

1. UL 20, Standard for General-Use Snap Switches, CCN WMUZ.
2. UL 498, Standard for Attachment Plugs and Receptacles, CCN RTRT.
3. UL 894, Standard for Safety Switches for Use in Hazardous (Classified) Locations.
4. UL 943, Standard for Ground-Fault Circuit-Interrupters (Class A), CCN KCXS.
5. UL 1010, Standard for Safety Receptacle-Plug Combinations for Use in Hazardous (Classified) Locations.
6. ANSI/NEMA WD 6 for dimensional requirements for receptacles and plugs rated up to 60A and 600V.
7. NEMA WD 1 for colors.
8. Federal Specifications:

    a. FS W-S-896 for switches.
    b. FS W-C-596 for receptacles.

C. Device Color:

1. White: Devices located in administrative office areas, conference rooms, break rooms, restrooms, and control rooms.
2. Gray: Devices located in electrical rooms, mechanical rooms, process areas, and outdoors.

D. Wall Plate Color: For non-metallic covers, match device color.

E. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.2 INDUSTRIAL SPECIFICATION GRADE RECEPTACLES, 125V, 20A

A. Duplex Receptacles, 125V, 20A

1. Manufacturers or equal:

    a. Arrow-Hart (Eaton), 5362 Series.
    b. Hubbell, 5362 Series.
    c. Leviton, 5362 Series.

2. Description: Heavy duty, industrial, specification grade, two-pole, three-wire, and self-grounding, NEMA 5-20R.

B. Duplex Weather-Resistant Receptacles, 120V, 20A. Drawing Designation: WP.

1. Hubbell, HBL5362WR Series or equal.
2. Description: Heavy duty, industrial, specification grade, weather-resistant, two-pole, three-wire, and self-grounding, NEMA 5-20R.

C. Duplex GFCI Receptacles, 125V, 20A. Drawing Designations GFCI.

1. Manufacturers or equal:

a. Hubbell GF5362SG Series.
b. Arrow-Hart (Eaton) TWRSGF20 Series.
c. Leviton GFTR2-3L Series.

2. Description: Extra heavy duty, industrial, specification grade, tamper-resistant, weather resistant, ground-fault circuit-interrupter receptacle, two-pole, three-wire, and self-grounding, NEMA 5-20R.

a. Integral GFCI with “Test” and “Reset” buttons.
b. Three LED indicators: power solid green, GF/trip solid red, ending of life flashing red.

2.3 HAZARDOUS (CLASSIFIED) LOCATION DEVICES

A. Hazardous (Classified) Locations Receptacles and Switches. Drawing Designation: XP.

1. Enclosure Rating: NEC Hazardous Area Class I, Divisions 1 and 2, Groups C and D (NEMA 7) and wet locations.
2. Receptacle Description: Explosion-proof factory sealed, pin and sleeve receptacle, 20A, for use at 125 or 250V, two wire, 3 pole.

a. Complete with cast box and matching plug.
b. Appleton Contender CPS152 Series with matching cover and CPP plug or equivalent by Crouse-Hinds.
c. With optional GFCI if noted on Drawing.

3. Switch Description: Explosion-proof factory sealed, control station switch, 20A, for use at 120/277V, single pole.

a. Complete with cast box.
b. Appleton Contender EDS Series or equivalent by Crouse-Hinds.

2.4 INDUSTRIAL SPECIFICATION GRADE TOGGLE SWITCHES, 120/277V, 20A

A. Manufacturers as listed below or equal.

1. Arrow-Hart (Eaton), 1220 Series.
2. Hubbell, HBL1220 Series.
3. Leviton, 1220 Series.

B. Description: Extra heavy duty, industrial, specification grade, switch, 120/277V, 20A, toggle action, flush mounting, quiet type.

1. Single pole, double pole, three-way, or four-way, as indicated on Drawings.

2.5 WALL PLATES

A. Match gang configuration as indicated on Drawings.

B. Obtain wall plates from same manufacturer as wiring device.

C. Plate-Securing Screws: Metal with head color to match plate finish.

D. Material for administrative offices, conference rooms, break rooms, restrooms, and control rooms: Smooth, high impact thermoplastic or nylon.

E. Material for flush mounted devices in electrical rooms, mechanical rooms, and indoor process areas: Type 302 (18-8) high nickel stainless steel.

F. Material for surface mounted device plates: Same material as box.

G. WP Receptacle Cover Plates: In-use weather-resistant, heavy duty die-cast aluminum with lockable cover.

H. WP Switch Cover Plates: Weatherproof switch cover, listed to UL514D, non-metallic UV-resistant, operable without opening cover, lockable.

1. Arrow-Hart (Eaton) S2983 or equal.

2.6 CORD AND PLUG SETS

A. Match voltage and current ratings and number of conductors to requirements of equipment being connected.

B. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and ampacity of at least 130 percent of the equipment rating.

C. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install devices in accordance with NFPA 70, manufacturer’s instructions, and listing for each device.

B. Install switch and receptacle outlets flush with finished wall for new wall construction and where existing wall is stud and sheetrock construction.

C. Drawings show the general location of devices unless dimensioned. Adjust and coordinate location to avoid piping or other obstructions.

D. Use of one GFCI receptacle to protect downstream conventional receptacles is prohibited.

E. Device Mounting Heights (as measured to the center of the device box):

1. Switches and occupancy sensors: 48 inches AFF, located on strike side of door.

2. Wall receptacles, unless otherwise noted on Drawings:

    a. Process areas and shops: 36 inches AFF.
    b. Administration office areas: 18 inches AFF.
    c. Corridors and hallways: 18 inches AFF.
    d. Electrical and mechanical rooms: 18 inches AFF.
    e. Restrooms: 18 inches AFF.
    f. Above counters: 8 inches above countertop or at backsplash level.
    g. Exterior walls: 24 inches AFG.

3. Where walls are unplastered brick or masonry, adjust mounting height above so one horizontal edge of device box lines up with a horizontal joint in the masonry.

F. Device Boxes:

1. Install correct size and type box for the device(s) and location, allowing for adequate space for conductors, connectors, clamps, devices, and barriers, where required.
2. Install boxes level, plumb, and secure. Do not install boxes back-to-back in walls.

G. Coordination with Other Trades:

1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes, and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
2. Keep boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
3. Install wiring devices after all wall preparation, including painting, is complete.

H. Conductors:

1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
3. Provide adequate length of free conductors at boxes for devices without pigtails. Pigtailing existing conductors is permitted, provided the box is large enough.

I. Device Installation:

1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
4. Make equipment grounding conductor connections and splices so removal or disconnection of any wiring devices does not interrupt continuity of the branch circuit equipment grounding conductor.
5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw. Do not overlap conductors.

6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
7. Tighten unused terminal screws on the device.
8. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.

J. Orientation and Arrangement:

1. Install ground pin of vertically mounted receptacles down, and on horizontally mounted receptacles to the right.
2. Group adjacent switches under single, multi-gang wall plates.

K. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

3.2 IDENTIFICATION

A. Label receptacles and switches with panelboard identification and circuit number in accordance with Section 260553 "Identification for Electrical Systems."

B. Label receptacles that are non-GFCI type but GFCI protected, such as from a GFCI circuit breaker, with a label “GFCI Protected”.

3.3 FIELD QUALITY CONTROL

A. Verify correct operation of GFCI receptacles using GFCI tester.

B. Verify correct voltage and phasing at receptacles.

1. Use receptacle circuit tester for NEMA 5-20R receptacles. Use voltmeter for other receptacles.
2. Use phase sequence meter for three phase receptacles.

C. Correct deficiencies found and reverify.

D. Prepare field quality report certifying verification of correct installation.

SECTION 262813 - FUSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Cartridge fuses rated 600 V ac and less for use in the following:

    a. Control circuits.
    b. Motor-control centers.
    c. Panelboards.
    d. Switchboards.
    e. Enclosed controllers.
    f. Enclosed switches.

B. Related Requirements:

1. Section 260010 “Supplemental Requirements for Electrical” for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 “Facility Performance Requirements for Electrical” for seismic-load, wind-load, acoustical, and field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include construction details, material descriptions, dimensions of individual components and profiles and finishes for spare-fuse cabinets. Include the following for each fuse type indicated:

1. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings.

    a. For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.
    b. Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.

2. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
3. Current-limitation curves for fuses with current-limiting characteristics.

4. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse. Submit in electronic format suitable for use in coordination software and in PDF format.
5. Coordination charts and tables and related data.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For fuses to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

1. Ambient temperature adjustment information.
2. Current-limitation curves for fuses with current-limiting characteristics.
3. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse used on the Project. Submit in electronic format suitable for use in coordination software and in PDF format.
4. Coordination charts and tables and related data.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

1.6 FIELD CONDITIONS

A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F or more than 100 deg F, apply manufacturer's ambient temperature adjustment factors to fuse ratings.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.

2.2 CARTRIDGE FUSES

A. Characteristics: NEMA FU 1, current-limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.

1. Type RK-1: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
2. Type RK-5: 600-V, zero- to 600-A rating, 200 kAIC, time delay.

3. Type CC: 600-V, zero- to 30-A rating, 200 kAIC, time delay.
4. Type CD: 600-V, 31- to 60-A rating, 200 kAIC, time delay.
5. Type J: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
6. Type L: 600-V, 601- to 6000-A rating, 200 kAIC, time delay.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with NEMA FU 1 for cartridge fuses.

D. Comply with NFPA 70.

E. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

2.3 SPARE-FUSE CABINET

A. Characteristics: Wall-mounted steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.

1. Size: Adequate for storage of spare fuses specified with [15] <Insert number> percent spare capacity minimum.
2. Finish: Gray, baked enamel.
3. Identification: "SPARE FUSES" in 1-1/2-inch- high letters on exterior of door.
4. Fuse Pullers: For each size of fuse, where applicable and available, from fuse manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.

B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.

C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.

D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FUSE APPLICATIONS

A. Cartridge Fuses:

1. Service Entrance: Class L, time delay.
2. Feeders: Class L, time delay .
3. Motor Branch Circuits: Class RK5, time delay, time delay.
4. Large Motor Branch (601-4000 A): Class L, time delay.
5. Power Electronics Circuits: Class J, high speed.
6. Other Branch Circuits: Class RK1, time delay.
7. Control Transformer Circuits: Class CC, time delay, control transformer duty.

3.3 INSTALLATION

A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.

3.4 IDENTIFICATION

A. Install labels complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems" and indicating fuse replacement information inside of door of each fused switch and adjacent to each fuse block, socket, and holder.

END OF SECTION 262813

SECTION 262816 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Fusible switches.
2. Nonfusible switches.
3. Receptacle switches.
4. Shunt trip switches.
5. Molded-case circuit breakers (MCCBs).
6. Molded-case switches.
7. Enclosures.

B. Related Requirements:

1. Section 260010 “Supplemental Requirements for Electrical” for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 “Facility Performance Requirements for Electrical” for seismic-load, wind-load, acoustical, and field conditions applicable to Work specified in this Section.

1.3 DEFINITIONS

A. NC: Normally closed.

B. NO: Normally open.

C. SPDT: Single pole, double throw.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include nameplate ratings, dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

1. Enclosure types and details for types other than NEMA 250, Type 1.
2. Current and voltage ratings.

3. Short-circuit current ratings (interrupting and withstand, as appropriate).
4. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.
5. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device. Provide in PDF electronic format.

B. Shop Drawings: For enclosed switches and circuit breakers.

1. Include plans, elevations, sections, details, and attachments to other work.
2. Include wiring diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified testing agency.

B. Seismic Qualification Data: Certificates, for enclosed switches and circuit breakers, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

a. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.
b. Time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device. Provide in PDF electronic format.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

2. Fuse Pullers: for each size and type.

1.8 QUALITY ASSURANCE

A. Testing Agency Qualifications: Accredited by NETA.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

1.9 FIELD CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
2. Altitude: Not exceeding 6600 feet.

1.10 WARRANTY

A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: One year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to Section 260548.16 "Seismic Controls for Electrical Systems" as it applies to this Project. Definition varies with type of building and occupancy and is critical to valid certification. Option is used for essential facilities where equipment must operate immediately after an earthquake.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.2 GENERAL REQUIREMENTS

A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single manufacturer.

B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by UL or a NRTL if approved by the Owner and/or Engineer, and marked for intended location and application.

D. Comply with NFPA 70.

2.3 FUSIBLE SWITCHES

A. Type HD, Heavy Duty:

1. Single throw.
2. Three pole.
3. 600-V ac.
4. 1200 A and smaller.
5. UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate indicated fuses.
6. Lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

B. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Isolated Ground Kit: Internally mounted; insulated, labeled for copper and aluminum neutral conductors.
4. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
5. Auxiliary Contact Kit: Two NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 120-V ac.
6. Hookstick Handle: Allows use of a hookstick to operate the handle.
7. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.4 NONFUSIBLE SWITCHES

A. Type HD, Heavy Duty, Three Pole, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

B. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
3. Auxiliary Contact Kit: Two NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 120-V ac.
4. Hookstick Handle: Allows use of a hookstick to operate the handle.
5. Lugs: Mechanical type, suitable for number, size, and conductor material.
6. Service-Rated Switches: Labeled for use as service equipment.

© 2026 CDM Smith
All Rights Reserved

2.5 MOLDED-CASE CIRCUIT BREAKERS

A. Circuit breakers shall be constructed using glass-reinforced insulating material. Current carrying components shall be completely isolated from the handle and the accessory mounting area.

B. Circuit breakers shall have a toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. The circuit-breaker handle shall be over center, be trip free, and reside in a tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon shall be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with a push-to-trip button, located on the face of the circuit breaker to mechanically operate the circuit-breaker tripping mechanism for maintenance and testing purposes.

C. MCCBs shall be equipped with a device for locking in the isolated position.

D. Lugs shall be suitable for 167 deg F rated wire.

E. Standard: Comply with UL 489 with interrupting capacity to comply with available fault currents.

F. Thermal-Magnetic Circuit Breakers: Inverse time-current thermal element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

G. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.

H. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:

1. Instantaneous trip.
2. Long- and short-time pickup levels.
3. Long- and short-time time adjustments.
4. Ground-fault pickup level, time delay, and I-squared t response.

I. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.

J. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker and trip activation on fuse opening or on opening of fuse compartment door.

K. Ground-Fault Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).

L. Features and Accessories:

1. Standard frame sizes, trip ratings, and number of poles.
2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.

3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.
4. Ground-Fault Protection: Comply with UL 1053; remote-mounted and powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
5. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.

2.6 MOLDED-CASE SWITCHES

A. Description: MCCB with fixed, high-set instantaneous trip only, and short-circuit withstand rating equal to equivalent breaker frame size interrupting rating.

B. Standard: Comply with UL 489 with interrupting capacity to comply with available fault currents.

C. Features and Accessories:

1. Standard frame sizes and number of poles.
2. Lugs:

    a. Mechanical type, suitable for number, size, trip ratings, and conductor material.
    b. Lugs shall be suitable for 167 deg F rated wire.

3. Ground-Fault Protection: Comply with UL 1053; remote-mounted and powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
4. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
5. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
6. Auxiliary Contacts: One SPDT switch with "a" and "b" contacts; "a" contacts mimic switch contacts, "b" contacts operate in reverse of switch contacts.
7. Alarm Switch: One NO contact that operates only when switch has tripped.
8. Key Interlock Kit: Externally mounted to prohibit switch operation; key shall be removable only when switch is in off position.
9. Zone-Selective Interlocking: Integral with ground-fault shunt trip unit; for interlocking ground-fault protection function.
10. Electrical Operator: Provide remote control for on, off, and reset operations.

2.7 ENCLOSURES

A. Enclosed Switches and Circuit Breakers: UL 489, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.

B. Enclosure Finish: The enclosure shall be finished with gray baked enamel paint or Owner approved color and paint, electrodeposited on cleaned, phosphatized galvannealed steel (NEMA 250 Types 3R, 12).

C. Conduit Entry: NEMA 250 Types 4, 4X, and 12 enclosures shall contain no knockouts. NEMA 250 Types 7 and 9 enclosures shall be provided with threaded conduit openings in both endwalls.

D. Operating Mechanism: The circuit-breaker operating handle shall be directly operable through the dead front trim of the enclosure (NEMA 250 Type 3R). The cover interlock mechanism shall have an externally operated override. The override shall not permanently disable the interlock mechanism, which shall return to the locked position once the override is released. The tool used to override the cover interlock mechanism shall not be required to enter the enclosure in order to override the interlock.

E. Enclosures designated as NEMA 250 Type 4, 4X 316 stainless steel, 12, or 12K shall have a dual cover interlock mechanism to prevent unintentional opening of the enclosure cover when the circuit breaker is ON and to prevent turning the circuit breaker ON when the enclosure cover is open.

F. NEMA 250 Type 7/9 enclosures shall be furnished with a breather and drain kit to allow their use in outdoor and wet location applications.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

1. Commencement of work shall indicate Installer's acceptance of the areas and conditions as satisfactory.

3.2 ENCLOSURE ENVIRONMENTAL RATING APPLICATIONS

A. Enclosed Switches and Circuit Breakers: Provide enclosures at installed locations with the following environmental ratings.

1. Indoor, Dry and Clean Locations: NEMA 250, Type 12.
2. Outdoor Locations: NEMA 250, Type 4X, stainless steel, type 316.
3. Wash-Down Areas: NEMA 250, Type 4X, stainless steel, type 316
4. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4, fiberglass reinforced polymer.
5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

6. Hazardous Areas Indicated on Drawings: NEMA 250, Type 7 with cover attached by Type 316 stainless steel bolts.

3.3 INSTALLATION

A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

C. Comply with mounting and anchoring requirements specified in Section 260548.16 "Seismic Controls for Electrical Systems."

D. Temporary Lifting Provisions: Remove temporary lifting of eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

E. Install fuses in fusible devices.

F. Comply with NFPA 70 and NECA 1.

3.4 IDENTIFICATION

A. Comply with requirements in Section 260553 "Identification for Electrical Systems."

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Perform tests and inspections with the assistance of a factory-authorized service representative.

E. Tests and Inspections for Switches:

1. Visual and Mechanical Inspection:

a. Inspect physical and mechanical condition.
b. Inspect anchorage, alignment, grounding, and clearances.
c. Verify that the unit is clean.
d. Verify blade alignment, blade penetration, travel stops, and mechanical operation.

e. Verify that fuse sizes and types match the Specifications and Drawings.
f. Verify that each fuse has adequate mechanical support and contact integrity.
g. Inspect bolted electrical connections for high resistance using one of the two following methods:

1) Use a low-resistance ohmmeter.

a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.

2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.

a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.

h. Verify that operation and sequencing of interlocking systems is as described in the Specifications and shown on the Drawings.
i. Verify correct phase barrier installation.
j. Verify lubrication of moving current-carrying parts and moving and sliding surfaces.

2. Electrical Tests:

a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
b. Measure contact resistance across each switchblade fuseholder. Drop values shall not exceed the high level of the manufacturer's published data. If manufacturer's published data are not available, investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
c. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with switch closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.
d. Measure fuse resistance. Investigate fuse-resistance values that deviate from each other by more than 15 percent.
e. Perform ground fault test according to NETA ATS 7.14 "Ground Fault Protection Systems, Low-Voltage."

F. Tests and Inspections for Molded Case Circuit Breakers:

1. Visual and Mechanical Inspection:

a. Verify that equipment nameplate data are as described in the Specifications and shown on the Drawings.
b. Inspect physical and mechanical condition.
c. Inspect anchorage, alignment, grounding, and clearances.
d. Verify that the unit is clean.
e. Operate the circuit breaker to ensure smooth operation.
f. Inspect bolted electrical connections for high resistance using one of the two following methods:

1) Use a low-resistance ohmmeter.

a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.

2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.

a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.

g. Inspect operating mechanism, contacts, and chutes in unsealed units.

2. Electrical Tests:

a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
b. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with circuit breaker closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.
c. Perform a contact/pole resistance test. Drop values shall not exceed the high level of the manufacturer's published data. If manufacturer's published data are not available, investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
d. Perform insulation resistance tests on all control wiring with respect to ground. Applied potential shall be 500-V dc for 300-V rated cable and 1000-V dc for 600-V rated cable. Test duration shall be one minute. For units with solid state components, follow manufacturer's recommendation. Insulation resistance values shall be no less than two megohms.
e. Determine the following by primary current injection:

1) Long-time pickup and delay. Pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.

2) Short-time pickup and delay. Short-time pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.
3) Ground-fault pickup and time delay. Ground-fault pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.
4) Instantaneous pickup. Instantaneous pickup values shall be as specified and within manufacturer's published tolerances.

f. Test functionality of the trip unit by means of primary current injection. Pickup values and trip characteristics shall be as specified and within manufacturer's published tolerances.
g. Perform minimum pickup voltage tests on shunt trip and close coils in accordance with manufacturer's published data. Minimum pickup voltage of the shunt trip and close coils shall be as indicated by manufacturer.
h. Verify correct operation of auxiliary features such as trip and pickup indicators; zone interlocking; electrical close and trip operation; trip-free, anti-pump function; and trip unit battery condition. Reset all trip logs and indicators. Investigate units that do not function as designed.
i. Verify operation of charging mechanism. Investigate units that do not function as designed.

3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
4. Perform the following infrared scan tests and inspections and prepare an Initial and Follow-up report:

a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each enclosed switch and circuit breaker. Remove front panels so joints and connections are accessible to portable scanner.
b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each enclosed switch and circuit breaker 11 months after date of Substantial Completion.
c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

5. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

G. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

H. Prepare test and inspection reports.

1. Test procedures used.
2. Include identification of each enclosed switch and circuit breaker tested and describe test results.
3. List deficiencies detected, remedial action taken, and observations after remedial action.

© 2026 CDM Smith
All Rights Reserved

3.6 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges to values indicated on the Drawings.

SECTION 263600 - TRANSFER SWITCHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes nonautomatic transfer switches rated 600 V and less.

B. Related Requirements:

1. Section 260010 “Supplemental Requirements for Electrical” for additional abbreviations, definitions, submittals, qualifications, testing agencies, and other Project requirements applicable to Work specified in this Section.
2. Section 260011 “Facility Performance Requirements for Electrical” for seismic-load, wind-load, acoustical, and field conditions applicable to Work specified in this Section.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for transfer switches.
2. Include rated capacities, operating characteristics, electrical characteristics, and accessories.

B. Shop Drawings:

1. Include plans, elevations, sections, details showing minimum clearances, conductor entry provisions, gutter space, and installed features and devices.
2. Include material lists for each switch specified.
3. Single-Line Diagram: Show connections between transfer switch,power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For manufacturer-authorized service representative.

B. Seismic Qualification Data: Certificates, for transfer switches, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

a. Features and operating sequences, both automatic and manual.
b. List of all factory settings of relays; provide relay-setting and calibration instructions, including software, where applicable.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications:

1. Member company of NETA.

a. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 FIELD CONDITIONS

A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service:

1. Notify Construction Manager no fewer than two days in advance of proposed interruption of electrical service.
2. Do not proceed with interruption of electrical service without Construction Manager's written permission.

1.8 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of transfer switch or transfer switch components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NEMA ICS 1.

C. Comply with NFPA 110.

D. Comply with UL 1008 unless requirements of these Specifications are stricter.

E. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, including tungsten filament lamp loads not exceeding 30 percent of switch ampere rating, unless otherwise indicated.

F. Tested Fault-Current Closing and Short-Circuit Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.

1. Where transfer switch includes internal fault-current protection, rating of switch and trip unit combination shall exceed indicated fault-current value at installation location.
2. Short-time withstand capability for 0.5 seconds.

G. Repetitive Accuracy of Solid-State Controls: All settings shall be plus or minus 2 percent or better over an operating temperature range of minus 20 to plus 70 deg C.

H. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.62. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.

I. Electrical Operation: Accomplish by a nonfused, momentarily energized solenoid or electric-motor-operated mechanism. Switches for emergency or standby purposes shall be mechanically and electrically interlocked in both directions to prevent simultaneous connection to both power sources unless closed transition.

J. Neutral Terminal: Solid and fully rated unless otherwise indicated.

K. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, by color-code or by numbered or lettered wire and cable with printed shrinkable sleeve markers at terminations. Color-coding and wire and cable markers are specified in Section 260553 "Identification for Electrical Systems."

1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated.
3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.
4. Accessible via rear access.

L. Enclosures: General-purpose NEMA 250, Type 12, complying with NEMA ICS 6 and UL 508, unless otherwise indicated.

2.2 CONTACTOR-TYPE AUTOMATIC TRANSFER SWITCHES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. ASCO Power Technologies.
2. Eaton.
3. Russelectric, Inc.

B. Comply with Level 2 equipment according to NFPA 110.

C. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.

1. Limitation: Switches using molded-case switches or circuit breakers or insulated-case circuit-breaker components are unacceptable.
2. Switch Action: Double throw; mechanically held in both directions.
3. Contacts: Silver composition or silver alloy for load-current switching. Contactor-style automatic transfer-switch units, rated 600 A and higher, shall have separate arcing contacts.
4. Conductor Connectors: Suitable for use with conductor material and sizes.
5. Material: Hard-drawn copper, 98 percent conductivity.
6. Main and Neutral Lugs: Mechanical type.
7. Ground Lugs and Bus-Configured Terminators: Mechanical type.
8. Connectors shall be marked for conductor size and type according to UL 1008.

D. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.

E. Electric Nonautomatic Switch Operation: Electrically actuated by push buttons designated "Normal Source" and "Alternative Source." Switch shall be capable of transferring load in either direction with either or both sources energized.

2.3 NONAUTOMATIC TRANSFER SWITCHES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. ASCO Power Technologies.
2. Eaton.
3. Russelectric, Inc.

B. Manual and Electrically Operated: Electrically actuated by push buttons designated "Normal Source" and "Alternative Source." Manual handle provides quick-make, quick-break manual-switching action. Switch shall be capable of electrically or manually transferring load in either

direction with either or both sources energized. Control circuit disconnects from electrical operator during manual operation.

C. Double-Throw Switching Arrangement: Incapable of pauses or intermediate position stops during switching sequence.

D. Pilot Lights: Indicate source to which load is connected.

E. Source-Available Indicating Lights: Supervise sources via transfer-switch normal- and alternative-source sensing circuits.

1. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
2. Emergency Power Supervision: Red light with nameplate engraved "Alternative Source Available."

F. Unassigned Auxiliary Contacts: Switch shall have one set of normally closed contacts for each switch position, rated 10 A at 240-V ac.

G. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.

1. Switch Action: Double throw; mechanically held in both directions.
2. Contacts: Silver composition or silver alloy for load-current switching.
3. Conductor Connectors: Suitable for use with conductor material and sizes.
4. Material: Hard-drawn copper, 98 percent conductivity.
5. Main and Neutral Lugs: Mechanical type.
6. Ground Lugs and Bus-Configured Terminators: Mechanical type.
7. Connectors shall be marked for conductor size and type according to UL 1008.

2.4 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect components, assembled switches, and associated equipment according to UL 1008. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

B. Prepare test and inspection reports.

1. For each of the tests required by UL 1008, performed on representative devices, for optional standby systems. Include results of test for the following conditions:

a. Overvoltage.
b. Undervoltage.
c. Loss of supply voltage.
d. Reduction of supply voltage.
e. Alternative supply voltage or frequency is at minimum acceptable values.
f. Temperature rise.
g. Dielectric voltage-withstand; before and after short-circuit test.
h. Overload.

i. Contact opening.
j. Endurance.
k. Short circuit.
l. Short-time current capability.
m. Receptacle withstand capability.
n. Insulating base and supports damage.

PART 3 - EXECUTION

3.1 INSTALLATION

1. Comply with requirements for seismic control devices specified in Section 260548.16 "Seismic Controls for Electrical Systems."
2. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases.
3. Provide workspace and clearances required by NFPA 70.

B. Annunciator and Control Panel Mounting: Flush in wall unless otherwise indicated.

C. Identify components according to Section 260553 "Identification for Electrical Systems."

D. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

E. Comply with NECA 1.

3.2 CONNECTIONS

A. Wiring Method: Install cables in raceways and cable trays except within electrical enclosures. Conceal raceway and cables except in unfinished spaces.

1. Comply with requirements for raceways and boxes specified in Section 260533 "Raceways and Boxes for Electrical Systems."

B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

C. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

E. Connect twisted pair cable according to Section 260523 "Control-Voltage Electrical Power Cables."

F. Route and brace conductors according to manufacturer's written instructions. Do not obscure manufacturer's markings and labels.

G. Brace and support equipment according to Section 260548.16 "Seismic Controls for Electrical Systems."

H. Final connections to equipment shall be made with liquidtight, flexible metallic conduit no more than 18 inches in length.

3.3 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. After installing equipment, test for compliance with requirements according to NETA ATS.
2. Visual and Mechanical Inspection:

    a. Compare equipment nameplate data with Drawings and Specifications.
    b. Inspect physical and mechanical condition.
    c. Inspect anchorage, alignment, grounding, and required clearances.
    d. Verify that the unit is clean.
    e. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
    f. Verify that manual transfer warnings are attached and visible.
    g. Verify tightness of all control connections.
    h. Inspect bolted electrical connections for high resistance using one of the following methods, or both:

        1) Use of low-resistance ohmmeter.
        2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method according to manufacturer's published data.

    i. Perform manual transfer operation.
    j. Verify positive mechanical interlocking between normal and alternate sources.
    k. Perform visual and mechanical inspection of surge arresters.
    l. Inspect control power transformers.

        1) Inspect for physical damage, cracked insulation, broken leads, tightness of connections, defective wiring, and overall general condition.
        2) Verify that primary and secondary fuse or circuit-breaker ratings match Drawings.
        3) Verify correct functioning of drawout disconnecting contacts, grounding contacts, and interlocks.

3. Electrical Tests:

    a. Perform insulation-resistance tests on all control wiring with respect to ground.
    b. Perform a contact/pole-resistance test. Compare measured values with manufacturer's acceptable values.
    c. Verify settings and operation of control devices.
    d. Calibrate and set all relays and timers.
    e. Verify phase rotation, phasing, and synchronized operation.
    f. Perform automatic transfer tests.
    g. Verify correct operation and timing of the following functions:

1) Normal source voltage-sensing and frequency-sensing relays.
2) Engine start sequence.
3) Time delay on transfer.
4) Alternative source voltage-sensing and frequency-sensing relays.
5) Automatic transfer operation.
6) Interlocks and limit switch function.
7) Time delay and retransfer on normal power restoration.
8) Engine cool-down and shutdown feature.

4. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.

   a. Check for electrical continuity of circuits and for short circuits.
   b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
   c. Verify that manual transfer warnings are properly placed.
   d. Perform manual transfer operation.

5. After energizing circuits, perform each electrical test for transfer switches stated in NETA ATS and demonstrate interlocking sequence and operational function for each switch at least three times.

   a. Simulate power failures of normal source to automatic transfer switches and retransfer from emergency source with normal source available.
   b. Simulate loss of phase-to-ground voltage for each phase of normal source.
   c. Verify time-delay settings.
   d. Verify pickup and dropout voltages by data readout or inspection of control settings.
   e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
   f. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

B. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.

C. Transfer switches will be considered defective if they do not pass tests and inspections.

D. Remove and replace malfunctioning units and retest as specified above.

E. Prepare test and inspection reports.

F. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.

1. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
2. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.
3. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.

3.4 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain transfer switches and related equipment.

B. Training shall include testing ground-fault protective devices and instructions to determine when the ground-fault system shall be retested. Include instructions on where ground-fault sensors are located and how to avoid negating the ground-fault protection scheme during testing and circuit modifications.

SECTION 284621.11 - ADDRESSABLE FIRE-ALARM SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. System smoke detectors.
2. Device guards.
3. Addressable interface device.

B. Related Requirements:

1. Section 271513 "Communications Copper Horizontal Cabling" for cables and conductors for fire-alarm systems.
2. Section 233300 “Air Duct Accessories” for duct smoke detector for fire-alarm systems.

1.3 DEFINITIONS

A. EMT: Electrical Metallic Tubing.

B. FACP: Fire Alarm Control Panel.

C. HLI: High Level Interface.

D. NICET: National Institute for Certification in Engineering Technologies.

E. PC: Personal computer.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product, including furnished options and accessories.

1. Include construction details, material descriptions, dimensions, profiles, and finishes.
2. Include rated capacities, operating characteristics, and electrical characteristics.

B. Shop Drawings: For fire-alarm system.

1. Comply with recommendations and requirements in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.

2. Include plans, elevations, sections, details, and attachments to other work.
3. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and locations. Indicate conductor sizes, indicate termination locations and requirements, and distinguish between factory and field wiring.
4. Detail assembly and support requirements.
5. Include voltage drop calculations for notification-appliance circuits.
6. Include battery-size calculations for additional equipment.
7. Include updated input/output matrix.
8. Include statement from manufacturer that all equipment and components have been tested as a system and meet all requirements in this Specification and in NFPA 72.
9. Include performance parameters and installation details for each detector.
10. Verify that each duct detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.
11. Provide program report showing that air-sampling detector pipe layout balances pneumatically within the airflow range of the air-sampling detector.
12. Include plans, sections, and elevations of heating, ventilating, and air-conditioning ducts, drawn to scale; coordinate location of duct smoke detectors and access to them.

    a. Show critical dimensions that relate to placement and support of sampling tubes, detector housing, and remote status and alarm indicators.
    b. Show field wiring and equipment required for HVAC unit shutdown on alarm and override by firefighters' smoke-evacuation system as applicable.
    c. Locate detectors according to manufacturer's written recommendations.

13. Include floor plans to indicate final outlet locations showing address of each addressable device. Show size and route of cable and conduits and point-to-point wiring diagrams.

C. General Submittal Requirements:

1. Submittals are approved by authorities having jurisdiction prior to submitting them to Engineer.
2. Shop Drawings prepared by persons with the following qualifications:

    a. Trained and certified by manufacturer in fire-alarm system design.
    b. NICET-certified, fire-alarm technician; Level III minimum.
    c. Licensed or certified by authorities having jurisdiction.

1.5 DELEGATED-DESIGN SUBMITTAL

A. For notification appliances and smoke and heat detectors, in addition to submittals listed above, indicate compliance with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Drawings showing the location of each notification appliance and smoke and heat detector, ratings of each, and installation details as needed to comply with listing conditions of the device.
2. Design Calculations: Calculate requirements for selecting the spacing and sensitivity of detection, complying with NFPA 72. Calculate spacing and intensities for strobe signals and sound-pressure levels for audible appliances.

3. Indicate audible appliances required to produce square wave signal per NFPA 72.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Field quality-control reports.

C. Sample Warranty: For special warranty.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For fire-alarm systems and components to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:

a. Comply with the "Records" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
b. Provide "Fire Alarm and Emergency Communications System Record of Completion Documents" according to the "Completion Documents" Article in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
c. Complete wiring diagrams showing connections between all devices and equipment. Each conductor numbered at every junction point with indication of origination and termination points.
d. Riser diagram.
e. Device addresses.
f. Provide "Inspection and Testing Form" according to the "Inspection, Testing and Maintenance" chapter in NFPA 72, and include the following:

1) Equipment tested.
2) Frequency of testing of installed components.
3) Frequency of inspection of installed components.
4) Requirements and recommendations related to results of maintenance.
5) Manufacturer's user training manuals.

g. Manufacturer's required maintenance related to system warranty requirements.
h. Abbreviated operating instructions for mounting at fire-alarm control unit and each annunciator unit.

B. Software and Firmware Operational Documentation:

1. Software operating and upgrade manuals.
2. Program Software Backup: On magnetic media or compact disk, complete with data files.
3. Device address list.
4. Printout of software application and graphic screens.

1.8 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Smoke Detectors, Fire Detectors: Quantity equal to 10 percent of amount of each type installed, but no fewer than one unit of each type.
2. Detector Bases: Quantity equal to one percent of amount of each type installed, but no fewer than one unit of each type.
3. Keys and Tools: One extra set for access to locked or tamperproofed components.

1.9 QUALITY ASSURANCE

A. Installer Qualifications: Personnel trained and certified by manufacturer for installation of units required for this Project.

B. Installer Qualifications: Installation by personnel certified by NICET as fire-alarm Level II technician.

C. NFPA Certification: Obtain certification according to NFPA 72 by a UL-listed alarm company.

1.10 PROJECT CONDITIONS

A. Perform a full test of the existing system prior to starting work. Document any equipment or components not functioning as designed.

B. Interruption of Existing Fire-Alarm Service: Do not interrupt fire-alarm service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary guard service according to requirements indicated:

1. Notify Construction Manager no fewer than seven days in advance of proposed interruption of fire-alarm service.
2. Do not proceed with interruption of fire-alarm service without Construction Manager's written permission.

C. Use of Devices during Construction: Protect devices during construction unless devices are placed in service to protect the facility during construction.

1.11 SEQUENCING AND SCHEDULING

A. Existing Fire-Alarm Equipment: Maintain existing equipment fully operational until new equipment has been tested and accepted. As new equipment is installed, label it "NOT IN SERVICE" until it is accepted. Remove labels from new equipment when put into service, and label existing fire-alarm equipment "NOT IN SERVICE" until removed from the building.

B. Equipment Removal: After acceptance of new fire-alarm system, remove existing disconnected fire-alarm equipment and wiring.

1.12 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace fire-alarm system equipment and components that fail in materials or workmanship within specified warranty period.

1. Warranty Extent: All equipment and components not covered in the Maintenance Service Agreement.
2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Source Limitations for Fire-Alarm System and Components:

1. Components compatible with, and operate as an extension of, existing system.
2. Provide system manufacturer's certification that all components provided have been tested as, and will operate as, a system.

B. Noncoded, UL-certified addressable system, with multiplexed signal transmission and voice or horn/strobe evacuation.

C. Automatic sensitivity control of certain smoke detectors.

D. All components provided are listed for use with the selected system.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 SYSTEMS OPERATIONAL DESCRIPTION

A. Existing fire-alarm signal initiation remain in place and additionally for:.

1. Duct smoke detectors.

B. Existing fire-alarm signal actions will continue to remain active.

C. Existing supervisory signal initiation will remain.

D. Exsting system trouble signal initiation by existing devices and actions will remain.

E. Existing System Supervisory Signal Actions to remain.

2.3 SYSTEM SMOKE DETECTORS

A. Duct Smoke Detectors: Photoelectric type complying with UL 268A.

1. Detector address accessible from fire-alarm control unit and able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, able to manually access the following for each detector:

    a. Primary status.
    b. Device type.
    c. Present average value.
    d. Present sensitivity selected.
    e. Sensor range (normal, dirty, etc.).

3. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector for smoke detection in HVAC system ducts.
4. Each sensor has multiple levels of detection sensitivity.
5. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied.
6. Relay Fan Shutdown: Fully programmable relay rated to interrupt fan motor-control circuit.
7. Remote Test Switch: listed for use with duct smoke detector.

2.4 ADDRESSABLE INTERFACE DEVICE

A. General:

1. Include address-setting means on the module.
2. Store an internal identifying code for control panel use to identify the module type.
3. Listed for controlling HVAC fan motor controllers.

B. Monitor Module: Microelectronic module providing a system address for alarm-initiating devices for wired applications with normally open contacts.

C. Integral Relay: Capable of providing a direct signal to circuit-breaker shunt trip for power shutdown.

1. Allow the control panel to switch the relay contacts on command.
2. Have a minimum of two normally open and two normally closed contacts available for field wiring.

2.5 DEVICE GUARDS

A. Description: Welded wire mesh of size and shape for the manual station, smoke detector, gong, or other device requiring protection.

1. Factory fabricated and furnished by device manufacturer.
2. Finish: Paint of color to match the protected device.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance of the Work.

1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment and wiring are installed, before installation begins.

B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EQUIPMENT INSTALLATION

A. Comply with NFPA 72, NFPA 101, and requirements of authorities having jurisdiction for installation and testing of fire-alarm equipment. Install all electrical wiring to comply with requirements in NFPA 70 including, but not limited to, Article 760, "Fire Alarm Systems."

1. Devices placed in service before all other trades have completed cleanup shall be replaced.
2. Devices installed but not yet placed in service shall be protected from construction dust, debris, dirt, moisture, and damage according to manufacturer's written storage instructions.

B. Connecting to Existing Equipment: Verify that existing fire-alarm system is operational before making changes or connections.

1. Connect new equipment to existing control panel in existing part of the building.
2. Connect new equipment to existing monitoring equipment at the supervising station.
3. Expand, modify, and supplement existing control/monitoring equipment as necessary to extend existing control/monitoring functions to the new points. New components shall be capable of merging with existing configuration without degrading the performance of either system.

C. Install wall-mounted equipment, with tops of cabinets not more than 78 inches above the finished floor.

D. Duct Smoke Detectors: Comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct. Tubes more than 36 inches long shall be supported at both ends.

1. Do not install smoke detector in duct smoke-detector housing during construction. Install detector only during system testing and prior to system turnover.

2. Install remote test switches in accessible locations, clearly labeled and identified.

E. Remote Status and Alarm Indicators: Install in a visible location near each smoke detector, sprinkler water-flow switch, and valve-tamper switch that is not readily visible from normal viewing position.

F. Device Location-Indicating Lights: Locate in public space near the device they monitor.

3.3 PATHWAYS

A. Pathways: installed in Conduit.

B. Exposed Conduit: painted red enamel.

3.4 CONNECTIONS

A. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 36 inches from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.

1. Smoke dampers in air ducts of designated HVAC duct systems.

3.5 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 270553 "Identification for Communications Systems."

B. Install updated framed instructions in a location visible from fire-alarm control unit.

3.6 GROUNDING

A. Ground fire-alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control unit.

B. Ground shielded cables at the control panel location only. Insulate shield at device location.

3.7 FIELD QUALITY CONTROL

A. Field tests witnessed by authorities having jurisdiction.

B. Perform tests and inspections.

C. Perform the following tests and inspections:

1. Visual Inspection: Conduct visual inspection prior to testing.

a. Inspection shall be based on completed record Drawings and system documentation that is required by the "Completion Documents, Preparation" table in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
b. Comply with the "Visual Inspection Frequencies" table in the "Inspection" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72; retain the "Initial/Reacceptance" column and list only the installed components.

2. System Testing: Comply with the "Test Methods" table in the "Testing" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
3. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.
4. Test audible appliances for the private operating mode according to manufacturer's written instructions.
5. Test visible appliances for the public operating mode according to manufacturer's written instructions.

D. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.

E. Fire-alarm system will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

G. Maintenance Test and Inspection: Perform tests and inspections listed for weekly, monthly, quarterly, and semiannual periods. Use forms developed for initial tests and inspections.

3.8 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by skilled employees of manufacturer's designated service organization. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

1. Include visual inspections according to the "Visual Inspection Frequencies" table in the "Testing" paragraph of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
2. Perform tests in the "Test Methods" table in the "Testing" paragraph of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
3. Perform tests per the "Testing Frequencies" table in the "Testing" paragraph of the "Inspection, Testing and Maintenance" chapter in NFPA 72.

3.9 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain fire-alarm system.

SECTION 310515 - SOILS AND AGGREGATES FOR EARTHWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Soils: Soil materials and topsoil materials.
2. Aggregates: Coarse aggregate materials and fine aggregate materials.

B. Related Sections:

1. Section 312000 “Earthwork.”
2. Section 312333 “Trenching and Backfilling”
3. Section 312500 “Erosion and Sedimentation Control.”
4. Section 321123 “Aggregate Base Courses.”
5. Section 329219 “Seeding.”
6. Section 329200 “Turf and Grasses.”

1.3 ACTION SUBMITTALS

A. Quality Control Testing: Submit conformance testing performed by a certified independent laboratory engaged by Contractor for all fill materials. Verify maximum density, gradation, Atterberg limits, sand equivalent, and other applicable criteria at least 72 hours prior to importing or placing any fill. Perform additional conformance testing at a minimum frequency of 1 per every 2000 cubic yards or change in material.

1.4 INFORMATIONAL SUBMITTALS

A. Materials Source: Submit name and location of imported materials suppliers.

B. Source’s Certificate: Certify materials meet or exceed specified requirements.

C. Material Test Reports: For each soil and aggregate material proposed for fill and backfill as follows:

1. Classification according to ASTM D2487.
2. Laboratory compaction curve according to ASTM D1557.
3. Test Reports: Submit any test reports required by this Section to the Engineer.

© 2026 CDM Smith
All Rights Reserved

1.5 QUALITY ASSURANCE

A. Furnish each subsoil and topsoil material from single source throughout the Work, unless an alternate source is approved by the Engineer.

B. Furnish each coarse and fine aggregate material from single source throughout the Work, unless an alternate source is approved by the Engineer.

C. Perform Work according to NYSDOT Standard Specifications and Standard .

D. Quality Control and Quality Assurance consists of laboratory conformance testing of samples supplied from each coarse and fine aggregate source and quality control during installation.

1. Geotechnical Testing Agency Qualifications: Qualified according to ASTM E329 and ASTM D3740 for testing indicated.

E. Maintain one copy of each standard affecting Work of this Section on Site.

1.6 FIELD CONDITIONS

A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during earth-moving operations.

1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction.
2. Provide alternate routes around closed or obstructed traffic ways if required by Owner or authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

A. Common Fill:

1. Approved imported fill material that is composed of durable soil free of roots, vegetative matter, debris, organic matter, topsoil, loam, waste, highly micaceous silt, frozen soil, or other deleterious and/or objectionable materials.
2. Does not contain stones larger than 6 inches in largest diameter.
3. Maximum of 50 percent passing the No. 200 sieve.
4. Maximum liquid limit of 60 percent.
5. Maximum plasticity index of 30 percent.
6. Maximum dry density of at least 95 pounds per cubic foot (pcf) as determined by ASTM D1557.
7. Does not contain more than 5 percent organic or deleterious material.
8. Does not contain granite blocks, broken concrete, masonry rubble, or other similar materials and with physical properties such that it can be readily spread and compacted during filling.

B. Select Common Fill:

1. As specified above for common fill, except contains no stones larger than 2 inches in largest diameter.

C. Structural Fill:

1. Consist of mineral soil free of organic material, loam, debris, frozen soil or other deleterious material which may be compressible, or which cannot be properly compacted,
2. Liquid Limit: 50 percent maximum.
3. Plasticity Index: 10 percent maximum.
4. Maximum Dry Density: 95 pcf minimum, as determined by ASTM D1557.
5. Meets the following gradation for Sieve Size and Percent Fines by Weight:

a. 3-inch: 100.
b. No. 4: 20 to 70.
c. No. 40: 5 to 35.
d. No. 200: 0 to 10.

2.2 TOPSOIL MATERIALS

A. Topsoil shall be in accordance with the requirements in the New York Standards and Specifications for Erosion and Sediment Control. Topsoil shall be fertile, friable, loamy, debris-free natural topsoil typical of topsoil of the locality and shall be obtained from a well-drained site that is free of flooding. It shall be without admixture of subsoil or slag and free of stones, lumps, plants or their roots, sticks, clay, peat and other extraneous matter and shall not be delivered to the site or used while in a frozen or muddy condition. Topsoil as delivered to the site or stockpiled shall have pH between 6.0 and 7.0 and shall contain not less than 6 percent nor more than 20 percent, by weight, of fine-textured stable organic material; not less than 20 percent fine-textured material passing the No. 200 sieve; not more than 15 percent clay; and less than 10 percent gravel. Topsoil shall be relatively free of stones greater than 1-1/2 inches in diameter, trash, debris, noxious weeds, and other objectionable material. Topsoil containing soluble salts greater than 500 parts per million shall not be used. Topsoil shall be uniformly placed and graded to the depth in accordance with the following:

Table 4.7 - Topsoil Application Depth

Site Conditions	Intended Use	Minimum Topsoil Depth
1. Deep sand or loamy sand	Mowed lawn	6 in.
	Tall legumes, unmowed	2 in.
	Tall grass, unmowed	1 in.
2. Deep sand or loamy sand	Mowed lawn	5 in.
	Tall legumes, unmowed	2 in.
	Tall grass, unmowed	none
3. Six inches or more: silt loam, clay loam, loam, or silt	Mowed lawn	4 in.
	Tall legumes, unmowed	1 in.
	Tall grass, unmowed	1 in.

B. Topsoil (Type S3): Conforming to New York State Department of Transportation standard.

2.3 COARSE AGGREGATE MATERIALS

A. Coarse Aggregate - Crushed Stone: Natural stone; free of clay, shale, organic matter; conforming to New York State Department of Transportation standard.

1. Coarse Aggregate Designation: No. 57.

B. Coarse Aggregate- Dense Graded Aggregate (DGA)

1. DGA shall conform to the gradation requirements of virgin stone meeting the specifications of NJDOTSS Section 901.10.01:

Sieve Size	Percent Finer by Weight
1 1/2-in	100
3/4-in	55 to 90
No. 4	25 to 50
No. 50	5 to 20
No. 200	3 to 10

C. Coarse Aggregate - Screened Gravel: Natural stone; hard, durable, rounded, or sub-angular particles of proper size and gradation, and shall be free from sand, loam, clay, excess fines, and other deleterious materials; to the following limits:

1. Percent Passing per Sieve Size:

a. 5/8- inch100 percent.
b. 1/2-inch (: 40 to 100 percent.
c. 3/8-inch: 15 to 45 percent.
d. No. 10 : 0 to 5 percent.

D. Coarse Aggregate - Pea Gravel: Natural stone; free of clay, shale, organic matter; graded according to ASTM C136; to the following limits:

1. Percent Passing per Sieve Size:

a. 1/2- inch100 percent.
b. 3/8-inch : 90 percent.
c. No. 4: 30 percent.
d. No. 8 : 10 percent.
e. No. 16 : 5 percent.

2.4 FINE AGGREGATE MATERIALS

A. Fine Aggregate - Sand: Natural river or bank sand; free of silt, clay, loam, friable or soluble materials, and organic matter; graded according to ASTM C33; within the following limits:

1. Percent Passing per Sieve Size:

a. No. 495 to 100.
b. No. 880 to 100.
c. No. 1650 to 85.
d. No. 3025 to 60.
e. No. 5010 to 30.
f. No. 1002 to 10.

2.5 SOURCE QUALITY CONTROL

A. Subsoil Material - Testing and Analysis: Perform in accordance with ASTM D1557.

B. Topsoil Material - Testing and Analysis: Perform in accordance with ASTM D1557.

C. Coarse Aggregate Material - Testing and Analysis: Perform according to ASTM D1557.

D. Fine Aggregate Material - Testing and Analysis: Perform according to ASTM D1557.

E. When tests indicate materials do not meet specified requirements, change material and retest.

F. Furnish materials of each type from same source throughout the Work.

PART 3 - EXECUTION

3.1 EXCAVATION - SOILS

A. Excavate subsoil and topsoil from areas designated by Engineer as specified in Section 312000 “Earthwork” and Contract Drawings. Strip topsoil to full depth of topsoil in designated areas.

B. Remove all excavated materials from site.

3.2 EXCAVATION - AGGREGATES

A. Coordinate excavation of aggregate materials from on-site locations designated by Engineer as specified in Section 312000 “Earthwork.”

B. Remove all excavated materials from the site.

3.3 STOCKPILING

A. Stockpile materials on site at locations indicated on Drawings.

B. Stockpile in sufficient quantities to meet Project schedule and requirements.

C. Separate different soil and aggregate materials with dividers or stockpile individually to prevent mixing. Prevent intermixing of soil types or contamination.

D. Stockpile topsoil 8 feet high maximum.

E. Direct surface water away from stockpile site to prevent erosion or deterioration of materials.

F. Cover stockpiles with plastic tarp to maintain proper moisture control.

G. Stockpile unsuitable and/or hazardous materials on impervious liner and cover to prevent erosion and leaching, until disposed of.

3.4 STOCKPILE CLEANUP

A. Remove stockpile, leave area in clean and neat condition. Grade site surface back to original grade and to prevent free standing surface water.

END OF SECTION 310515

© 2026 CDM Smith
All Rights Reserved

SECTION 311000 - SITE CLEARING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Preparation

2. Temporary erosion and sedimentation control

3. Existing utilities
4. Clearing and grubbing.
5. Topsoil stripping.
6. Site improvements.
7. Disposal of surplus and waste materials
8. Temporary erosion and sedimentation control.

B. Related Requirements:

1. Section 015639 “Temporary Tree and Plant Protection” for temporary protection of existing vegetation.
2. Section 312500 “Erosion and Sedimentation Controls” for temporary protection of erosion and sedimentation.

1.3 DEFINITIONS

A. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than one percent organic matter and few soil organisms.

B. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil," but in disturbed areas such as urban environments, the surface soil can be subsoil.

C. Topsoil: Top layer of the soil profile consisting of existing native surface topsoil or existing in-place surface soil; the zone where plant roots grow. Its appearance is generally friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects larger than 2 inches in diameter; and free of weeds, roots, toxic materials, or other nonsoil materials.

D. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

1.4 MATERIAL OWNERSHIP

A. Except for materials indicated to be stockpiled or otherwise remain Owner's property, cleared materials shall become Contractor's property and shall be removed from Project site.

1.5 INFORMATIONAL SUBMITTALS

A. Existing Conditions: Documentation of existing trees and plantings, adjoining construction, and site improvements that establishes preconstruction conditions that might be misconstrued as damage caused by site clearing.

1. Use sufficiently detailed photographs or video recordings.
2. Include plans and notations to indicate specific wounds and damage conditions of each tree or other plant designated to remain.

B. Record Drawings: Identifying and accurately showing locations of capped utilities and other subsurface structural, electrical, and mechanical conditions.

1.6 FIELD CONDITIONS

A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during site-clearing operations.

1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction.
2. Provide alternate routes around closed or obstructed roadways if required by Owner or authorities having jurisdiction.

B. Salvageable Improvements: Carefully remove items indicated to be salvaged and store on Owner's premises as directed by the Engineer.

C. Utility Locator Service: Notify One Call for area where Project is located before site clearing.

D. Do not commence site clearing operations until temporary erosion- and sedimentation-control measures are in place.

E. Soil Stripping, Handling, and Stockpiling: Perform only when the soil is dry or slightly moist.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Satisfactory Soil Material: Requirements for satisfactory soil material are specified in Section 312000 "Earthwork."

1. Obtain approved borrow soil material off-site.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect and maintain benchmarks and survey control points from disturbance during construction.

B. Protect existing site improvements to remain from damage during construction.

1. Restore damaged improvements to their original condition, as acceptable to Owner.

C. Call Local Utility Line Information service not less than three working days before performing Work.

1. Request underground utilities to be located and marked within and surrounding construction areas.

3.2 TEMPORARY EROSION AND SEDIMENTATION CONTROL

A. Provide temporary erosion- and sedimentation-control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to erosion- and sedimentation-control Drawings and requirements of authorities having jurisdiction.

B. Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross protection zones.

C. Inspect, maintain, and repair erosion- and sedimentation-control measures during construction until permanent vegetation has been established.

D. Remove erosion and sedimentation controls, and restore and stabilize areas disturbed during removal.

3.3 EXISTING UTILITIES

A. Locate, identify, disconnect, and seal or cap utilities indicated to be removed or abandoned in place.

1. Arrange with utility companies to shut off indicated utilities.

B. Locate, identify, and disconnect utilities indicated to be abandoned in place.

C. Interrupting Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others, unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Engineer not less than five days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Engineer’s written permission.

D. Excavate for and remove underground utilities indicated to be removed.

E. Removal of underground utilities is included in earthwork sections; in applicable fire suppression, plumbing, HVAC, electrical, communications, electronic safety and security, and utilities sections; and in Section 024119 "Selective Demolition".

3.4 CLEARING AND GRUBBING

A. Remove obstructions, trees, shrubs, and other vegetation to permit installation of new construction.

1. Do not remove trees, shrubs, and other vegetation indicated to remain or to be relocated.
2. Grind down stumps and remove roots larger than 2 inches in diameter, obstructions, and debris to a depth of 18 inches below exposed subgrade.
3. Use only hand methods or air spade for grubbing within protection zones.
4. Chip removed tree branches and dispose of off-site.

B. Fill depressions caused by clearing and grubbing operations with satisfactory soil material unless further excavation or earthwork is indicated.

1. Place fill material in horizontal layers not exceeding a loose depth of 8 inches, and compact each layer to a density equal to adjacent original ground.

3.5 TOPSOIL STRIPPING

A. Remove sod and grass before stripping topsoil.

B. Strip topsoil to depth of 6 inches in a manner to prevent intermingling with underlying subsoil or other waste materials.

1. Remove subsoil and nonsoil materials from topsoil, including clay lumps, gravel, and other objects larger than 2 inches in diameter; trash, debris, weeds, roots, and other waste materials.

C. Stockpile topsoil away from edge of excavations without intermixing with subsoil or other materials. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust and erosion by water.

3.6 SITE IMPROVEMENTS

A. Remove existing above- and below-grade improvements as indicated and necessary to facilitate new construction.

B. Remove slabs, paving, curbs, gutters, and aggregate base as indicated.

1. Unless existing full-depth joints coincide with line of demolition, neatly saw-cut along line of existing pavement to remain before removing adjacent existing pavement. Saw-cut faces vertically.

2. Paint cut ends of steel reinforcement in concrete to remain with two coats of antirust coating, following coating manufacturer's written instructions. Keep paint off surfaces that will remain exposed.

3.7 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Remove surplus soil material, unsuitable topsoil, obstructions, demolished materials, and waste materials including trash and debris, and legally dispose of them off Owner's property.

END OF SECTION 311000

SECTION 312319 - DEWATERING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Dewatering System.
2. Surface Water Control System.
3. Monitoring Wells.
4. System Operation and Maintenance.
5. Dewatering Effluent Disposal.

1.2 REFERENCES

A. Storm Water Pollution Prevention Plan (SWPPP)

B. ASTM standards applicable to piping, equipment and other items required for a complete dewatering system

1.3 DEFINITIONS

A. Dewatering System:

1. System of wells, well points, sumps, ejectors, pumps, power supply, effluent treatment equipment and equipment designed by Contractor, submitted to and approved by the Engineer prior to dewatering, that will effectively dewater the site as required herein. Adequate observation wells shall be included in the dewatering system to verify drawdown levels inside the excavation area and monitor groundwater levels outside the limits of the excavation near adjacent structures.

B. Dewatering includes the following:

1. Lowering of ground water table and intercepting horizontal water seepage to prevent ground water from entering, excavations and trenches.
2. Reducing piezometric pressure within strata to prevent failure or heaving of excavations and trenches.
3. Disposing of removed water.

C. Construction Dewatering:

1. Controlling groundwater levels, hydrostatic pressures and controlling surface water, such that excavation required on the Contract Drawings can be performed to required depths in substantially dry and stable conditions.

D. Surface Water Control: Removal of surface water within open excavations.

1.4 SYSTEM DESCRIPTION

A. Provide dewatering and surface water control systems to permit Work to be completed on dry and stable subgrade.

B. Provide monitoring wells and monitoring equipment to obtain meaningful observations of conditions affecting excavation, adjacent structures, and adjacent water wells.

C. Furnish standby equipment stored at Project site and ready for immediate use upon failure of dewatering equipment.

1.5 PERFORMANCE REQUIREMENTS

A. The Contractor's attention is directed to:

1. Special Notices:

   a. Protection of Water Resources and the Environment
   b. Department of Environmental Facilities (DEF) Environmental Management System (EnvMS) Requirements – Soil Erosion and Sediment Control Activities.

2. General Clause 14.

B. The Contractor shall design, provide, install, operate, maintain and remove the Dewatering System as necessary to:

1. Lower and maintain groundwater levels and hydrostatic pressures to 2 feet below the prevailing excavation level or to a point no higher than 2 feet above the top of an impermeable stratum, if the subgrade is in the impermeable stratum. Groundwater levels shall be lowered for a time period as necessary to ensure adequate factor of safety for the constructed structure.
2. Maintain stability of sides and bottoms of excavations.
3. Control and remove seepage and surface water into excavations.
4. Relieve hydrostatic pressures in confined water bearing strata below excavation to eliminate risk of uplift or other instability of excavation.
5. Prevent damage to adjacent properties, buildings, structures, utilities, and facilities from construction operations.
6. Prevent loss of fines, development of quick condition, or softening of foundation subgrade.
7. Allow subsequent work to be safely performed and not result in damage to adjacent properties, buildings, structures, utilities and other work.

C. The method of dewatering and control of water both inside and outside the excavation shall be selected by the Contractor who shall be solely responsible for the location, arrangement and depth of any system(s) selected to accomplish the work. The Contractor shall construct

protective works as necessary to dewater, cut off porous zones of fill and direct the flow of water from whatever source away from the excavations and adjacent areas. Protective works shall include slurry methods, grouting, clay seepage plugs, toe drains with appropriate filters, deep wells, wellpoints, sumps, dikes, ditches and all supporting features as required, but not specifically shown on the Contract Drawings, to permit construction in the dry.

D. Dewatering Effluent Disposal

1. The Contractor shall manage and dispose of effluent generated during dewatering activities in accordance with SWPPP.
2. Dewatering effluent shall not be discharged to the sanitary sewer.
3. The Contractor shall provide appropriately sized settling tanks, basins, or other devices to remove suspended solids form the dewatering effluent; and control effluent discharge rates as required by the SWPPP.

    a. Sampling of the tank, basin or other device effluent and measurement of discharge flow rates shall be as required by disposal/discharge criteria.
    b. The tanks, basins or other devices shall be provided with an overflow collection system or other safeguards to prevent accidental release of dewatering effluent.
    c. Routine inspection of the tanks, basins or other devices shall be carried out daily to ensure that their integrity is being maintained, and that all valves or openings are properly locked out to avoid accidental discharge
    d. Settling tanks, basins or other devices shall be cleaned frequently to prevent excess deposition of solids which could overflow. Removed solids shall be classified and disposed of in accordance with applicable codes, rules and regulations.

4. The Contractor shall provide appropriately sized oil/water separators to remove hydrocarbons, grease and other floatable materials from the dewatering effluent prior to discharge.
5. The Contractor shall provide treatment for, or remove from the site to an approved disposal facility, all dewatering effluent that exceeds any limit set for discharge.

    a. Classification and disposal shall be the responsibility of the Contractor.
    b. No separate payment will be made for treatment or disposal of such effluent.

1.6 SUBMITTALS

A. Section 01 33 00 “Submittal Procedures”: Requirements for submittals.

B. Review of the Dewatering System by the Engineer shall not in any way relieve the Contractor from full responsibility for the complete and adequate design and performance of the dewatering system to provide the necessary Construction Dewatering.

C. Dewatering and Excavation Plan: A Dewatering and Excavation Plan shall be submitted to the Engineer at least 30 calendar days prior to the commencement of the dewatering work and, at a minimum, shall include the following:

1. Description and profile of geology, soil, and groundwater conditions.
2. Detailed description of the Dewatering and Monitoring System installation including procedures for operation and maintenance of equipment, and description of emergency procedures to follow when problems arise
3. Design calculations demonstrating the adequacy of the proposed Dewatering System, including depth to groundwater at excavation limits.
4. Calculations and requisite technical data on well screens and filter materials and gradations to demonstrate the adequacy of proposed systems to prevent the pumping of fines.
5. Working drawings showing the Dewatering System to be used. Working Drawings shall include:

    a. Arrangements, locations and depths of the Dewatering System
    b. A complete description of equipment and materials to be used and the procedure to be followed in installation, operation and maintenance in relation to the proposed sequence of excavation, foundation construction and backfilling.
    c. Layout and depth of monitoring wells, piezometers and flow measuring devices for system performance measurement.
    d. Location and size of sumps, ditches and water discharge lines, including their relation to water disposal points
    e. The proposed locations of points of effluent treatment equipment, effluent flow equalization tanks and discharge of water.
    f. Proposed types and locations of proposed surface water control

6. Standby equipment and standby power supply.
7. Discharge details, metering, and reading schedules and the details of the settling tank and oil/water separator
8. Methods to be used for drilling, construction, and development of wells and piezometers.
9. Permits and Notifications

    a. List of permits required
    b. List of agencies having jurisdiction to be notified.
    c. Schedule for obtaining permits
    d. Schedule for the notification of agencies having jurisdiction.

10. The dewatering and Excavation Plan shall be prepared by a Professional Engineers registered in the State of New York.

D. Product Data: Submit data for each of the following:

1. Dewatering Pumps: Indicate sizes, capacities, priming method, motor characteristics.
2. Pumping equipment for control of surface water within excavation.

E. As-built Submittals: During installation of the dewatering system and prior to the start of Construction Dewatering, submit as-built conditions of the Dewatering System. As-built data are to include but are not limited to:

1. Plans and sections showing as-built locations, and surveyed elevations of the Dewatering System and its components.

2. Drawings to indicate changes made to the original Working Drawings to accommodate field conditions and to comply with design standards.
3. Details of installation including dimensions and materials used, description and drawings of all installations, all procedures, soil strata encountered and logs of soil samples.

F. Field Reports: As specified in Field Quality Control article.

G. The Contractor shall be responsible for compliance with all dewatering permit requirements once construction dewatering begins.

1.7 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations and depths of capped wells and piping abandoned in place.

1.8 QUALITY ASSURANCE

A. Comply with authorities having jurisdiction for the following:

1. Drilling and abandoning of wells used for dewatering systems.
2. Water discharge and disposal from pumping operations.

B. Obtain permit as required.

C. Perform Work in accordance with all applicable Federal, State and Municipal codes, rules and regulations including revisions to date.

1.9 QUALIFICATIONS

A. The dewatering work shall be performed by a specialty subcontractor specializing in and having experience installing and operating dewatering systems in similar subsurface conditions for at least 5 years.

B. The Contractor may perform the dewatering work if he has experience conforming to the above requirements..

C. The Contractor shall assume sole responsibility for dewatering and surface water control systems and for loss or damage resulting from partial or complete failure of protective measures and settlement or resultant damage caused by ground water control operations.

D. Design, install, and monitor operation of dewatering under direct supervision of Professional Engineer registered in the State of New York having experience in the design of this Work

© 2026 CDM Smith
All Rights Reserved

1.10 PRE-INSTALLATION MEETINGS

A. Convene minimum one (1) week prior to commencing work of this section.

1.11 SEQUENCING

A. Sequence work to obtain required permits before start of dewatering operations.

B. Sequence work to install and test monitoring systems a minimum of one (1) week before testing and operating dewatering systems.

C. Sequence work to install and test dewatering systems a minimum of one (1) week before starting excavation.

1.12 COORDINATION

A. Coordinate work to permit the following construction operations to be completed on dry stable substrate.

1. Excavation for structures.
2. Trenching for utilities

B. Coordinate the operation of his dewatering system with existing and proposed construction.

PART 2 - PRODUCTS

2.1 GENERAL

A. Materials and equipment used in the Dewatering System shall adhere to accepted industry standards and be in good operating condition and able to perform satisfactorily over the required duration of construction dewatering.

B. Back up equipment for the Dewatering System shall be identical to the primary equipment and shall be available in operating condition at all times

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

A. Construction Dewatering is required to protect foundation subgrades and to maintain dry conditions for construction. The Contractor shall maintain a continuous and completely effective Dewatering System as required during the duration of construction.

© 2026 CDM Smith
All Rights Reserved

B. The Contractor shall be prepared to modify the dewatering system and methods as required by actual field conditions encountered during construction, at no additional cost to the Owner.

C. The Contractor shall measure water levels periodically in observation wells installed adjacent to nearby structures to ensure drawdown outside the excavation is within permissible limits specified in the Dewatering and Excavation Plan.

D. Surface areas adjacent to the excavation shall be graded and/or curbed to prevent flow of surface water into the excavation.

3.2 EXAMINATION

A. Conduct additional borings and investigations to supplement subsurface investigations as required to complete dewatering system design.

B. Locate underground piping, conduit, and other structures.

3.3 PREPARATION

A. Protect existing adjacent buildings, structures, and improvements from damage caused by dewatering operations.

3.4 TESTING

A. The Contractor is responsible for monitoring his dewatering efforts to determine if the project requirements are being met. The Contractor shall provide observation wells and other means to monitor the dewatering as detailed in the Dewatering and Excavation Plan.

B. Readings to determine the quantity of fines in the dewatering effluent shall be made a minimum of once every two weeks.

3.5 MONITORING WELLS

A. Install monitoring wells at locations indicated in the Dewatering and Excavation Plan.

B. Test each monitoring well point to verify installation is performing properly.

C. Install piezometers, calibrate, and test for proper operation.

D. Protect monitoring wells from damage by construction operations.

E. Maintain accessibility to monitoring wells continuously during construction operations.

F. Maintain monitoring wells until groundwater is allowed to return to normal level.

3.6 DEWATERING SYSTEM

A. Install dewatering system in accordance with the Dewatering and Excavation Plan.

B. Locate system components to allow continuous dewatering operations without interfering with installation of permanent Work and existing public rights-of-way, sidewalks, and adjacent buildings, structures, and improvements.

C. Drill wells in sizes and to depth indicated. Provide temporary surface casing when required to stabilize soil while advancing well.

D. Test wells for proper water flow through well screen and pumping rate for dewatering system operation. Repeat development until well meets performance requirements.

E. Cover and seal top of well until pump is installed.

F. Install pumps in accordance with manufacturer's instructions.

G. Connect pumps to discharge header. Install valves to permit pump isolation.

3.7 SURFACE WATER CONTROL SYSTEM

A. Provide ditches, berms, and other devices to divert and drain surface water from excavation area.

B. Divert surface water and seepage water within excavation areas into sumps and pump in accordance with requirements of the Dewatering and Excavation Plan.

C. Control and remove unanticipated water seepage into excavation.

D. Direct surface water to minimize surface erosion, ponding and softening of slopes and berms, including haul roads and equipment working stations.

E. Curbs shall be maintained and, where necessary, extended across intersections, curb cuts and defective curb sections. Surface cracks in the adjacent streets are to be sealed and re-sealed as necessary. Should adjacent settlement occur during the work, curbs shall be raised or water-tight mounds shall be installed as directed by the Engineer to prevent flow into the site.

3.8 SYSTEM OPERATION AND MAINTENANCE

A. The Dewatering System shall provide for an uninterrupted flow of pumped water and shall be maintained and pumped as necessary to drawdown and maintain the groundwater levels as specified. Unless otherwise specified, pumping shall maintain those depressed levels until the permanent under drainage system has been installed, tested, accepted and is operational or until the permanent structure is capable of withstanding hydrostatic pressures as determined by the Engineer.

© 2026 CDM Smith
All Rights Reserved

B. The Contractor shall furnish, operate and maintain sufficient drainage and pumping facilities to dewater the site and its underlying soil. Dewatering operations shall operate in such a manner so that the excavation can proceed while maintaining stable slopes and the designed lateral support for the perimeter support of excavation walls, without disturbing the bearing subgrades for the structure. The ground water level as measured in monitoring wells shall be lowered and maintained at least two feet below the prevailing excavation level, or it shall be lowered to a point no higher than 2 feet above the top of impermeable stratum if the subgrade is in the impermeable stratum.

C. The dewatering system shall be installed and operated in such a manner as to avoid the movement of fines or loss of ground below the bearing level and shall not influence the stability of surrounding areas. Well points and deep wells shall be properly sanded in and sumps shall be sheeted and provided with proper filter material.

D. A sufficient number of monitoring wells shall be installed and water levels read by the Contractor, at least weekly, to demonstrate that the goals of the Dewatering System are being met. Water level readings shall be submitted within 24 hours to the Engineer. If applicable, the Contractor may make use of existing observation wells as shown on the Contract Drawings.

E. Open pumping with sumps and ditches resulting in boils, loss of fines, softening of the ground or instability of slopes will not be permitted.

F. Provide 24-hour supervision of dewatering system by personnel skilled in operation, maintenance, and replacement of system components.

G. Conduct daily observation of dewatering system and monitoring system. Make required repairs and perform scheduled maintenance.

H. Fill fuel tanks before tanks reach 25 percent capacity.

I. Start emergency generators at least twice each week to check operating condition.

J. When dewatering system cannot control water within excavation, notify the Engineer and stop excavation work.

1. Supplement or modify dewatering system and provide other remedial measures to control water within excavation.
2. Demonstrate dewatering system operation complies with performance requirements before resuming excavation operations.

K. Modify dewatering and surface water control systems when operation causes or threatens to cause damage to new construction, existing site improvements, adjacent property, or adjacent water wells.

L. Correct unanticipated pressure conditions affecting dewatering system performance.

M. Do not discontinue dewatering operations without Engineer’s approval.

© 2026 CDM Smith
All Rights Reserved

3.9 DEWATERING EFFUENT DISPOSAL

A. Discharge dewatering effluent in accordance with the requirements of the Dewatering and Excavation Plan, and the SWPPP.

3.10 SYSTEM REMOVAL

A. Remove dewatering and surface water control systems after dewatering operations are discontinued.

B. Repair damage caused by dewatering and surface water control systems or resulting from failure of systems to protect property.

3.11 FIELD QUALITY CONTROL

A. Survey existing adjacent buildings, structures, and improvements as indicated in the Dewatering and Excavation Plan to detect movement in comparison to original elevations during dewatering operations. Notify the Engineer immediately of measured movement.

B. Submit initial installation reports including the following:

1. Installation and development reports for well points and pumps.
2. Installation and baseline reports for monitoring wells and piezometers.
3. Initial dewatering flow rates.

C. Submit weekly monitoring reports including the following:

1. Dewatering flow rates.
2. Piezometer readings.
3. Maintenance records for dewatering and surface water control systems.

SECTION 312333 - TRENCHING AND BACKFILLING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes delegated design of trench excavation and support, backfilling, and compaction.

B. Related Requirements:

1. Section 310515 “Soils and Aggregates for Earthwork” for materials used as backfill and for sheeting and bracing.
2. Section 310519.13 “Geotextiles for Earthwork” for subsurface drainage geotextiles.
3. Section 312000 “Earthwork” for related earthwork activities.
4. Section 312319 "Dewatering" for dewatering and drainage.
5. Section 312500 “Erosion and Sedimentation Controls” to prevent erosion, sedimentation, and contamination of adjacent properties.
6. Section 329119 “Landscape Grading” for filling of topsoil over backfilled trenches to finish grade elevation.
7. Section 329200 “Turf and Grasses.”
8. Section 331116 “Site Water Utility Distribution Piping” for water piping and bedding from building to utility service.
9. Section 333100 “Sanitary Sewerage Piping” for sanitary sewer piping and bedding from building to utility service.
10. Section 334100 “Storm Utility Drainage Piping” for storm sewer piping and bedding from building to utility service.
11. Section 334600 “Subdrainage” for building perimeter drainage, filter aggregate, filter fabric, and granular cover.
    Section 335100 “Natural-Gas Distribution” for gas piping and bedding from building to utility service.

1.3 DEFINITIONS

A. Percent Compaction: Means at least the stated percentage of maximum density as determined by ASTM D1557, Method D.

1.4 ACTION SUBMITTALS

A. Submit proposed method of backfilling and compaction prior to start of Work.

1.5 DELEGATED DESIGN SUBMITTALS

A. Submit method of trench excavation and support, where necessary, including design of sheeting and bracing with calculations signed and sealed by qualified professional engineer responsible for their preparation.

B. Qualifications Statement: Submit qualifications for licensed professional.

1.6 INFORMATIONAL SUBMITTALS

A. Material Test Reports: For material excavated from trench for re-use as backfill, by a qualified testing agency.

1.7 QUALITY ASSURANCE

A. Comply with following regulations:

1. Occupational Safety and Health Administration (OSHA): 29 CFR Part 1926 Subpart P.

B. Professional Engineer Qualifications: Licensed Professional Engineer experienced in design of specified Work and licensed in the jurisdiction of Project location; having a minimum of 5 years' experience in design and construction of trench excavation and support.

C. Provide excavation, trenching, related sheeting, bracing, and related materials to comply with requirements of OSHA excavation safety standards (29 CFR Part 1926 Subpart P) Where conflict exists between OSHA and State regulations, more stringent requirements apply.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Store excavated materials according to Section 312500 "Erosion and Sedimentation Control" to prevent erosion of soil type materials and contamination of adjacent water sources.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Refer to Section 310515 "Soils and Aggregates for Earthwork" for soil and aggregate materials.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine that erosion and sedimentation controls are in place and comply with project requirements and authorities having jurisdiction.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Where excavation activities occur across active vehicular or pedestrian circulation paths, use temporary controls specified in Division 01 to maintain circulation during operations required by this Section. Maintain temporary controls for each day circulation paths are restricted.

B. Coordinate work of this Section with materials specified in other Sections of Division 31 and 32.

C. Identify required lines, levels, contours, and datum locations.

D. Protect features to remain-in-place including benchmarks, existing structures, fences, sidewalks, paving, curbs, etc. from excavating equipment and vehicular traffic.

E. Maintain and protect above and below grade utilities indicated to remain.

3.3 TRENCH EXCAVATION

A. Trench excavation includes material of every description and substance encountered.

B. Cut rigid and flexible pavement with a saw, wheel, or pneumatic chisel along straight lines before excavating.

C. Strip and stockpile topsoil from grassed areas crossed by trenches.

1. At Contractor's option when required, topsoil may be disposed of and replaced with approved topsoil of equal quality.

D. While excavating and backfilling is in progress, maintain traffic and protect utilities and other property.

E. Excavate trenches to indicated depths and in widths sufficient and of practical minimum for pipe laying, bracing, and pumping and drainage facilities.

F. Accomplish excavation and dewatering by methods preserving undisturbed state of subgrade soils. Excavate trench by machinery to or just below designated subgrade, if material remaining in trench bottom is no more than slightly disturbed.

1. Remove subgrade soils that become soft, loose, quick, or otherwise unsatisfactory due to inadequate excavation, dewatering, or other construction methods and replace with screened gravel fill acceptable to the Engineer at Contractor's expense.

G. Use care when working in clay and organic silt soils, which are particularly susceptible to disturbance due to construction operations. When excavation is to end in such soils, use a smooth-edge bucket to excavate the last 12 inches of depth.

H. Where pipe is to be laid in screened gravel bedding, excavate trench by machinery to normal depth of pipe, provided material remaining in trench bottom is no more than slightly disturbed.

I. Where pipe is to be laid directly on trench bottom, manually perform final excavation, providing a flat-bottom, true to grade upon undisturbed material. Make bell holes required by project conditions.

3.4 DISPOSAL OF MATERIALS

A. Stack excavated material without excessive surcharge on trench bank or obstructing free access to hydrants and gate valves. Avoid inconvenience to traffic and abutters. Segregated excavated material for use in backfilling as specified below.

B. All excavated material shall be removed from work site.

C. Should conditions make it impracticable or unsafe to stack material adjacent to trench, haul and store material at a location provided for temporary storage before permanent off-site disposal.

3.5 SHEETING AND BRACING

A. Provide and maintain sheeting and bracing required by Federal, State, or local safety requirements to support sides of excavation and prevent loss of ground which could endanger personnel, damage, adjacent structures, or delay the work.

1. Engineer may order additional supports placed at Contractor’s expense if it is determined that at any point sufficient or proper supports have not been provided. Provide sufficiency of supports even with compliance of such order. Take care to prevent voids outside of sheeting; if voids are formed, immediately fill and ram them.

B. When moveable trench bracing such as trench boxes, moveable sheeting, shoring or plates are used to support trench sides, take care in placing and moving the boxes or supporting bracing to prevent pipe movement, disturbance of pipe bedding, or screened gravel backfill.

1. Rigid Pipe Installation (such as R.C., V.C., A.C.): Raise that portion of box extending below mid-diameter above this point prior to moving box ahead to install next pipe. Perform to prevent separation of installed pipe joints due to box movement.
2. Flexible Pipe Installation (such as PVC): Do not allow trench boxes, moveable sheeting, shoring, or plates to extend below mid-diameter of pipe. As trench boxes, moveable sheeting, shoring, or plates are moved, place screened gravel to fill voids created. Re-compact screened gravel and backfill to provide uniform side support for pipe.

C. Engineer may give permission to use steel sheeting in lieu of wood sheeting for entire job wherever sheeting use is necessary. Include cost for use of sheeting in bid items for pipe, including full compensation for driving, bracing, and later removal of sheeting.

D. Carefully remove sheeting and bracing in manner to not endanger construction of other structures, utilities, or property, whether public or private. Immediately refill voids left after withdrawal of sheeting using sand by ramming with tools especially adapted to that purpose and watering or otherwise directed by the Engineer.

E. No payment will be given for sheeting, bracing, or other support during progress of the work. No payment will be given for sheeting left in trench for Contractor's convenience.

F. Leave sheeting driven below mid-diameter of pipe in place from driven elevation to at least 12 inches above top of pipe.

3.6 TEST PITS

A. Excavation of test pits may be required for purpose of locating underground utilities or structures as an aid in establishing the precise location of new work.

B. Backfill test pits as soon as desired information has been obtained. Maintain backfilled surface appropriate for travel until resurfaced.

3.7 EXCAVATION BELOW GRADE AND REFILL

A. Drain trench completely and effectively be in-the-dry, whatever the nature of unstable material encountered or groundwater conditions.

B. If excavating below grade through error or for their own convenience, through failure to properly dewater the trench, or disturbs subgrade before dewatering is sufficiently complete, the Engineer may direct Contractor to excavate below grade as set forth in following Paragraph, where work shall be performed at Contractor's own expense.

C. If material at trench bottom consists of fine sand, sand and silt or soft earth which may work into the screened gravel, even with effective drainage, remove subgrade material to extent directed. Refill excavation with a 6 inch layer of coarse sand or a mixture graded from coarse sand to fine pea stone to form a filter layer preserving voids in pipe gravel bed. Obtain composition and gradation of gravel shall be approval by the Engineer prior to placement. Place screened gravel in 6 inch layers thoroughly compacted up to normal grade of pipe. If directed by the Engineer, use bank-run gravel for refill of excavation below grade.

D. Subsurface Drainage Geotextile: Non-woven filter fabric as specified in Section 310519.13 "Geotextiles for Earthwork" may be substituted for filter layer, if approved by the Engineer.

3.8 BACKFILLING

A. Begin backfilling as soon as practicable after laying and jointing pipe and continue expeditiously. Place bedding gravel of specified type for pipe installed up to 12 inches over the pipe.

B. Typical Trench Dam: A low permeability trench dam or bulkhead cutoff of clay or other low permeability material shall be constructed in the trench as directed, to interrupt unnatural flow of groundwater after construction is completed. The low permeability trench dam shall be effectively keyed into the trench bottom and sidewalls. Provide at least one clay or other low permeability trench dam in pipe bedding between each manhole where directed or every 300 feet, whichever is less.

1. The low permeability trench dam material is to conform to the following properties:

    a. 100% passing the 1-inch Sieve
    b. Minimum 40% passing the 200 Sieve

c. Liquid Limit: 30% Min.
d. Plasticity Index: 10% Min.
e. Hydraulic Conductivity $<1 \times 10^{-7}$ cm/sec

C. Where pipes are laid cross-country, fill remainder of trench with common fill material in layers not to exceed 12 inches and mounded 6 inches above existing grade or as directed by the Engineer. Where a loam or gravel surface exists prior to cross-country excavations, remove, conserve and replace it to full original depth as part of the work under pipe items. Where necessary, remove excess material during clean-up process, so that ground may be restored to its original level and condition.

D. Where pipes are laid in streets, backfill remainder of trench up to a depth of 12 inches below bottom of specified permanent paving with select common fill material in layers not to exceed 12 inches and thoroughly compacted. Use bank-run gravel for subbase layer of paving and compact in 6 inches layers.

E. To prevent longitudinal pipe movement, do not dump backfill material into trench and then spread, until selected material or screened gravel has been placed and compacted to a level at least 12 inches over the pipe.

F. Bring backfill up evenly on all sides. Thoroughly compact each layer of backfill material by rolling, tamping, or vibrating with mechanical compacting equipment or hand tamping to 95 percent compaction according to ASTM D1557 or 98 percent according to ASTM D698. If rolling, use a suitable roller or tractor being careful to compact fill throughout full width of trench.

G. Do not compact by puddling or water jetting.

H. Use hand or pneumatic ramming with tools weighing at least 20 pounds for compacting in confined areas. Spread and compact material in layers not exceeding 6 inches thick, an uncompacted loose measurement.

I. Use granular fill material as backfill around structures. Spread and compact specified backfill under and over pipes connected to structures.

J. Do not place bituminous paving in backfill. Do not use frozen material under any circumstances.

K. Broom and hose-clean road surfaces immediately after backfilling. Employ dust control measures throughout construction period.

3.9 RESTORING TRENCH SURFACE

A. Where trench occurs adjacent to paved streets, in shoulders, sidewalks, or in cross-country areas, thoroughly consolidate backfill and maintain surface as the work progresses. If settlement takes place, immediately deposit additional fill to restore ground level.

B. In and adjacent to streets, use 12 inches of trench backfill below specified initial pavement consisting of compacted bank-run gravel. If Contractor wants to use material excavated from trench as gravel subbase for pavement replacement, take samples at intervals not to exceed 500

feet of material and test by an independent testing laboratory at Contractor’s expense. Use only materials approved by the Engineer.

C. Restore surface of driveways or other areas which are disturbed by trench excavation to a condition at least equal to that existing before work began.

D. In areas where pipeline passes through grassed areas, remove and replace sod or loam and seed surface at Contractor's own expense.

SECTION 312500 - EROSION AND SEDIMENTATION CONTROLS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Silt Fences.
2. Construction Entrances.
3. Site Stabilization

B. Related Sections:

1. Section 310515 “Soils and Aggregates for Earthwork.”
2. Section 311000 “Site Clearing.”
3. Section 329200 “Turf and Grasses”

1.3 ACTION SUBMITTALS

A. Submit, within 10 days after award of Contract, technical product literature for all commercial products.

1.4 CLOSEOUT SUBMITTALS

A. Section 017700 “Closeout Procedures”: Requirements for submittals.

1.5 QUALITY ASSURANCE

A. Be responsible for the timely installation and maintenance of all sedimentation control devices necessary to prevent the movement of sediment from the construction site to offsite areas or into the stream system via surface runoff or underground drainage systems. Measures in addition to those shown on the Drawings necessary to prevent the movement of sediment off site are to be installed, maintained, removed, and cleaned up at the expense of the Contractor. No additional charges to the Owner will be considered.

B. Sedimentation and erosion control measures are to conform to the requirements of the New York Standards and Specifications for Erosion and Sediment Control.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 AGGREGATE, AND SOIL MATERIALS

A. Coarse Aggregate (Crushed Stone): as specified in Section 310515 “Soils and Aggregates for Earthwork”.

2.2 SILT FENCE

A. Sediment fence shall be a prefabricated commercial product made of a woven, polypropylene, ultraviolet resistant material such as “Envirofence” by Mirafi Inc., Charlotte, NC or equal.

B. Include a drawstring in the top portion of the fence for added strength.

C. Posts: Constructed of hardwood with minimum diameter thickness of 1.5 inches (38 mm).

D. Tie wires for securing silt fence fabric to wire mesh shall be light gauge metal clips (hog rings), or 1/32 inch diameter soft aluminum wire.

2.3 PLANTING MATERIALS

A. Seeding and Soil Supplements: , as specified in Section 329200 “Turfs and Grasses”.] Furnish according to New York Standards and Specifications for Erosion and Sediment Control standards.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify compacted subgrade is acceptable and ready to support devices and imposed loads.

B. Verify gradients and elevations of base or foundation for other work are correct.

3.2 SILT FENCE

A. Position sediment fences as indicated on the Drawings and to prevent off site movement of sediment produced by construction activities as directed by the Engineer. Areas beyond limits of silt fence shall be undisturbed or stabilized.

B. Dig trench approximately 6 inch wide and 6 inch deep along proposed fence lines.

C. Drive stakes, 10 feet on center (maximum) at back edge of trenches. Drive stakes 2 feet (minimum) into ground.

D. Hang filter fabric on posts carrying to bottom of trench with about 4 inches of fabric laid across bottom of trench. Stretch fabric fairly taut along fence length and maintain secure both ways.

E. Backfill trench with excavated material and tamp.

3.3 Install pre-fabricated silt fence according to manufacturer's instructions.CONSTRUCTION ENTRANCE

A. Construct entrance with minimum of 6 inch of course aggregate at all points of ingress/egress.

B. Width: Minimum 20 feet, increased as needed for typical construction vehicles.

C. Minimum Length: 50 feet(where soils are course grained) minimum and as shown on Contract Drawings.

D. Install filter fabric below aggregate.

E. Maintain entrance throughout construction, adding more aggregate or increasing length as needed.

3.4 SITE STABILIZATION

A. Incorporate erosion control devices indicated on the Drawings into the Project at the earliest practicable time.

B. Construct, stabilize and activate erosion controls before site disturbance within tributary areas of those controls.

C. stockpile sides at 2: 1 or flatter.

D. Stabilize any disturbed area of affected erosion control devices on which activity has ceased and which will remain exposed for more than 20 days.

1. During non-germinating periods, apply mulch at recommended rates.

E. Stabilize diversion channels, sediment traps, and stockpiles immediately.

3.5 CLEANING

A. Section 017300 “Execution” and 017700 “Closeout Procedures”: Requirements for cleaning.

B. When sediment accumulation in sediment structures has reached a point one-third depth of sediment structure or device, remove and dispose of sediment.

C. Do not damage structure or device during cleaning operations.

D. Do not permit sediment to erode into construction or site areas or natural waterways.

E. Clean channels when depth of sediment reaches approximately one-half channel depth.

F. Once the site has been fully stabilized against erosion, remove sediment control devices and all accumulated silt. Dispose of silt and waste materials in proper manner and in accordance with

all local, state, and federal regulations. Regrade all areas disturbed during this process and stabilize against erosion with surfacing materials as indicated on the Drawings.

G. When Work is completed and with the written authorization of the Engineer, remove all sediment and erosion control devices and restore areas to original conditions.

3.6 PROTECTION

A. Immediately after placement, protect paving from premature drying, excessive hot or cold temperatures, and mechanical injury.

B. Do not permit construction traffic over paving for 7 days minimum after finishing.

C. Protect paving from elements, flowing water, or other disturbance until curing is completed.

END OF SECTION 312500

All Rights Reserved

SECTION 321123 - AGGREGATE BASE COURSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Aggregate subbase.
2. Aggregate base course.

B. Related Sections:

1. Section 312000 "Earthwork" for preparation of site for base course. and compacted fill under base course.
2. Section 312333 “Trenching and Backfilling”
3. Section 321216 "Asphalt Paving" for Binder and finish asphalt courses.

1.3 ACTION SUBMITTALS

A. Product Data:

1. Initial aggregate test reports.

B. Materials Source: Name of aggregate materials suppliers.

1.4 QUALITY ASSURANCE

A. Furnish each aggregate material from single source throughout the Work.

B. Perform Work according to NYSDOT Standard Specifications.

C. Maintain one copy of NYSDOT Standard Specifications on site.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Subbase Aggregate: NYSDOT Subbase Course, Type I, conforming to NYSDOT Standard Specifications 304 and 733-04

1. Percent Passing per Sieve Size:

Sieve Size		Percent Passing by Weight
3 inches	(75 mm)	100
2 inches	(50 mm)	90 to 100
1/4 inches	(6.3 mm)	30 to 65
No.40	(0.425 mm)	5 to 40
No. 200	(0.075 mm)	0 to 10

2. Composition: hard durable particles or fragments of:

a. Stone
b. Slag
c. Gravel
d. Sand
e. Stone dust

B. Crushed Stone, ¾ Inch: Crushed stone conforming to NYSDOT Standards Specifications Section 703-02; graded type.

1. Percent Passing per Sieve Size:

Sieve Size		Percent Passing by Weight
1 inches	(25.0 mm)	100
3/4 inches	(19 mm)	90 to 100
1/2 inches	(12.5 mm)	20 to 55
3/8 inches	(9.5 mm)	0 to 15
No.4	(4.75 mm)	0 to 5

2. Composition: hard durable particles of:

a. Stone
b. Gravel
c. Sand
d. May contain:

1) Silt
2) Clay
3) Stone dust

C. Fine Aggregate:

1. Screenings.
2. Angular sand.
3. Crushed recycled concrete fines.
4. Or other finely divided mineral matter.
5. Portion passing the No. 40 sieve either non-plastic or have a liquid limit less than 25 and a plasticity index less than 5.

2.2 INITIAL TESTS

A. Perform all of the following tests on the proposed material to demonstrate that it meets all specified requirements when furnished. Submit the initial test results to the Engineer for approval prior to commencement of construction.

1. Sieve Analysis including 0.02 mm material.
2. Liquid limit and plasticity index.
3. Moisture-density relationship.
4. Wear Resistance to Degradation (ASTM C131/C131M).
5. Weight per cubic meter of Slag.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Clean the underlying course or subgrade of all foreign substances prior to constructing the subbase base course(s).

B. Do not construct base/subbase course(s) on underlying course or subgrade that is frozen.

C. Prepare the surface of the underlying course or subgrade to meet specified compaction and surface tolerances.

D. Correct ruts or soft yielding spots in the underlying courses.

E. Correct areas having inadequate compaction, and deviations of the surface from the specified requirements:

1. Loosen and remove soft or unsatisfactory material and add approved material
2. Reshape to line and grade,
3. Recompact to specified density requirements.

F. For cohesion-less underlying courses or subgrades containing sands or gravels:

1. Stabilize the surface prior to placement of the base course(s):

a. Mix aggregate into the underlying course
b. Compact by approved methods.
c. Do not allow traffic or other operations to disturb the finished underlying course

d. Maintain underlying course until the base course is placed.

G. Verify that the underlying surface has been inspected, gradients and elevations are correct.

3.2 AGGREGATE PLACEMENT

A. Gravel road/surface only: Install geotextile fabric over subgrade according to manufacturer's instructions.

1. Lap ends and edges minimum 6 inches.
2. Anchor fabric to subgrade when required to prevent displacement until aggregate is installed.

B. Place aggregate equal thickness layers to total compacted thickness within ½ inch of the thickness indicated on the drawings.

1. Maximum lift Compacted Thickness: 8 inches .
2. Minimum lift Compacted Thickness: 4 inches .

C. Level and compact the base and subbase course to within ½ inch of the thickness indicated.

D. Degree of Compaction:

1. Compact aggregate lifts to 95 percent of laboratory maximum dry density.
2. Except as noted below, degree of compaction is expressed as a percentage of the maximum laboratory dry density obtained by the test procedure presented in ASTM D1557.
3. Degree of compaction for material having more than 30 percent by weight of their particles retained on the ¾ inch sieve will be expressed as a percentage of the laboratory maximum dry density in accordance with AASHTO T 180 Method D and corrected with AASHTO T 224.

E. Maintain optimum moisture content of material as necessary to achieve the specified degree of compaction.

3.3 ERECTION TOLERANCES

A. Maximum Variation from Flat Surface: 1/2 inch measured with 10 foot straight edge.

B. Maximum Variation from Thickness: 1/4 inch.

C. Maximum Variation from Elevation: 1/2 inch.

3.4 FIELD QUALITY CONTROL

A. Field Density Measurements: Measure field density in accordance with ASTM D1556/D1556M.

B. When tests indicate Work does not meet specified requirements, remove Work, replace and retest.

C. Frequency of Tests: One test for every 1000 square yards of each layer compacted aggregate or as directed by the Engineer.

SECTION 321216 - ASPHALT PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Asphalt materials.
2. Aggregate materials.
3. Aggregate subbase.
4. Asphalt paving base course, binder course, and wearing course.
5. Asphalt paving overlay for existing paving.

B. Related Requirement:

1. Section 312213 “Rough Grading”: Preparation of site for paving and base.
2. Section 312323 “Fill”: Compacted subbase for paving.
3. Section 321123 “Aggregate Base Courses”: Compacted subbase for paving.
4. Section 312000 “Earthwork.”
5. Section 312333 “Trenching and Backfilling.”

1.3 ACTION SUBMITTALS

A. Section 013300 “Submittal Procedures”: Requirements for submittals.

B. Product Data:

1. Submit product information for asphalt and aggregate materials.
2. Submit mix design with laboratory test results supporting design.

C. Manufacturer's Certificate: Certify all materials meet or exceed the requirements of New York Department of Transportation Standard Specifications .

1.4 QUALITY ASSURANCE

A. Obtain materials from same source throughout.

B. Tests:

1. Perform all of the following tests on the proposed material to demonstrate that it meets all specified requirements when furnished. Submit the initial test results to the Engineer for approval prior to commencement of construction.

    a. Sieve Analysis including 0.02 mm material.
    b. Liquid limit and plasticity index.
    c. Moisture-density relationship

C. Wear Resistance to Degradation (ASTM C131/C131M)

1.5 QUALIFICATIONS

A. Installer: Company specializing in performing work of this section with minimum 5 years documented experience.

1.6 AMBIENT CONDITIONS

A. Do not place asphalt mixture between November 1 and March 1.

B. Do not place asphalt mixture when ambient air or base surface temperature is less than 40 degrees, or surface is wet or frozen.

PART 2 - PRODUCTS

2.1 ASPHALT PAVING

A. Performance / Design Criteria:

1. Paving: Design for parking areas, access drives, and heavy duty commercial vehicles and service vehicles.
2. Asphalt pavement materials, production, placement, and compaction shall conform to the applicable requirements of the latest edition of the New York State Department of Transportation Standard Specifications, Construction and Materials, unless otherwise indicated in the Contract Documents.
3. All pavement thicknesses referred to herein and on the drawings are compacted thicknesses. The Contractor shall place sufficient mix to ensure that the specified thickness of pavement is provided.
4. Construct pavement to the lines, grades, elevations, cross slopes, and compacted thicknesses indicated on the Drawings. Finished pavement shall provide positive drainage.

B. Asphalt Materials:

1. Asphalt Binder: Performance-Graded (PG) asphalt binder conforming to NYSDOT Standard Specifications Section 702 and AASHTO M320. Provide the following performance grade, as indicated for the pavement application:

a. PG 64S-22: Heavy-duty pavement, access drives, and pavement subject to regular commercial, maintenance, and plant service vehicles.
b. PG 64V-22: Pavement subject to frequent heavy trucks, slow-moving heavy vehicles, loading/unloading operations, or concentrated truck maneuvering.

2. Tack Coat: Provide diluted or straight asphalt emulsion tack coat conforming to NYSDOT Standard Specifications Sections 407 and 702.

a. Apply tack coat between successive asphalt pavement courses.
b. Coat surfaces of manhole and catch basin frames with oil to prevent bond with asphalt paving. Do not tack coat these surfaces.
c. Application rates shall conform to NYSDOT Standard Specifications Section 407.

3. Reclaimed Asphalt Pavement (RAP): Processed material obtained by milling or full depth removal of existing asphalt paving. Use of RAP in asphalt mixtures shall conform to NYSDOT Standard Specifications Sections 401 and 404 and the approved mixture design.
4. Oil: In accordance with NYSDOT Standards.

C. Aggregate Materials:

1. Aggregate used in asphalt paving mixtures shall conform to the applicable requirements of NYSDOT Standard Specifications Sections 401, 404, and 703.
2. Coarse Aggregate: ASTM D692; crushed stone, gravel, or blast furnace slag.
3. Fine Aggregate: ASTM D1073; natural sand or sand manufactured from stone, gravel, or blast furnace slag.
4. Mineral Filler: ASTM D242; finely ground mineral particles, free of foreign matter.

D. Aggregate Subbase: Specified in Section 321123 ”Aggregate Base Courses”.

2.2 MIXES

A. Use dry material to avoid foaming. Mix uniformly.

B. Asphalt Paving Mixtures: Designed in accordance with NYSDOT standards.

1. Base Course: NYSDOT 37.5 Base Course
2. Binder Course: NYSDOT 19.0 Binder Course
3. Wearing Course: NYSDOT 9.5 Top Course

2.3 ACCESSORIES

A. Geotextile Fabric: AASHTO M288; non-woven, polypropylene.

B. Use Type 1 sealant rated 50 percent extension at 0 degrees F for other climates.

C. Sealant: ASTM D6690, Type II; hot applied type.

2.4 SOURCE QUALITY CONTROL

A. Submit proposed mix design of each class of mix for review prior to beginning of Work.

B. Test samples in accordance with NYSDOT Standard Specifications Sections 401 and 404 and NYSDOT Materials Procedures.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify utilities indicated under paving are installed with excavations and trenches backfilled and compacted.

B. Verify compacted subgrade and subbase is dry and ready to support paving and imposed loads.

1. Proof roll subbase in minimum two perpendicular passes to identify soft spots.
2. Remove soft subbase and replace with compacted fill as specified in Section 312323.

C. Verify gradients and elevations of base are correct.

D. Finished excavation and grading shall be uniformly smooth, well compacted, and free from irregular surface changes. The finished surface shall not be more than 0.10 feet above or below the new grade.

E. Verify gutter drainage grilles, manhole frames and inlets are installed in correct position and elevation.

F. The contact surfaces of castings and other structures shall be painted with a tack coat.

3.2 DEMOLITION

A. Saw cut and notch existing paving as indicated on Drawings.

B. Clean existing paving to remove foreign material, excess joint sealant and crack filler from paving surface.

C. Repair surface defects in existing paving to provide uniform surface to receive new paving.

3.3 INSTALLATION

A. Subgrade Preparation:

1. Clean the underlying course or subgrade of all foreign substances prior to constructing the subbase base course(s).
2. Do not construct base/subbase course(s) on underlying course or subgrade that is frozen.
3. Prepare the surface of the underlying course or subgrade to meet specified compaction and surface tolerances.

4. Correct ruts or soft yielding spots in the underlying courses
5. Correct areas having inadequate compaction, and deviations of the surface from the specified requirements:

    a. Loosen and remove soft or unsatisfactory material and add approved material.
    b. Reshape to line and grade
    c. Recompact to specified density requirements

6. For cohesion-less underlying courses or subgrades containing sands or gravels:

    a. Stabilize the surface prior to placement of the base course(s):

        1) Mix aggregate into the underlying course
        2) Compact by approved methods
        3) Do not allow traffic or other operations to disturb the finished underlying course
        4) Maintain underlying course until the base course is placed

7. Verify that the underlying surface has been inspected, gradients and elevations are correct.

B. Subbase/Base Preparation:

1. Place aggregate equal thickness layers to total compacted thickness within ½ inch of the thickness indicated on the drawings.

    a. Maximum lift Compacted Thickness: 6 inches
    b. Minimum lift Compacted Thickness: 3 inches

2. Level and compact the base subbase course to within ½ inch of the thickness indicated.
3. Degree of Compaction:

    a. Compact aggregate lifts to 95 percent of laboratory maximum dry density
    b. Except as noted below, degree of compaction is expressed as a percentage of the maximum laboratory dry density obtained by the test procedure presented in ASTM D1557.
    c. The degree of compaction of material having more than 30 percent by weight of their particles retained on the ¾ inch (19.0 mm) sieve will be expressed as a percentage of the laboratory maximum dry density in accordance with AASHTO T180 Method D and corrected with AASHTO T224.

4. Maintain optimum moisture content of material as necessary to achieve the specified degree of compaction.

C. Tack Coat:

1. Apply tack coat in accordance with NYDOT Standards.
2. Coat surfaces of manhole catch basin frames with oil to prevent bond with asphalt paving. Do not tack coat these surfaces.

D. Double Course Asphalt Paving:

1. Place asphalt binder course within 24 hours of applying primer or tack coat.
2. Place binder course to thickness indicated on Drawings.
3. Place wearing course within 24 hours of placing and compacting binder course. When binder course is placed more than 24 hours before placing wearing course, clean surface and apply tack coat before placing wearing course.
4. Place wearing course to thickness indicated on Drawings.
5. Compact each course by rolling to specified density. Do not displace or extrude paving from position. Hand compact in areas inaccessible to rolling equipment.
6. Perform rolling with consecutive passes to achieve even and smooth finish, without roller marks.

E. Asphalt Paving Overlay:

1. Apply tack coat to existing paving surface at rate recommended by geotextile fabric manufacturer.
2. Install geotextile fabric in accordance with manufacturer's instructions to permit asphalt saturation of fabric. Lap fabric edge and end joints 4 inches.
3. Place wearing course thickness indicated on Drawings.
4. Compact overlay by rolling to specified density. Do not displace or extrude paving from position. Hand compact in areas inaccessible to rolling equipment.
5. Perform rolling with consecutive passes to achieve even and smooth finish, without roller marks.

F. Joints:

1. Joints between old and new pavements, or between successive sections or lanes, shall be carefully made to ensure a proper bond for the full depth of the course. Joints shall be formed by cutting back the previous section to expose the full depth of the course. A tack coat shall be applied at all joints.
2. Joints adjacent to curbs, or adjoining pavement shall be formed by carrying back sufficient hot material to fill and space left uncovered by the paver. The joint shall then be set up with rakes to a sufficient height to receive full compression under the rollers.
3. Joints shall be given a seal coat after rolling is complete.
4. Broom and tack coat edges of existing pavement and base course with emulsified or cutback asphalt. Trim loose edges of existing pavement. Brook and tack coat all edges with emulsified or cutback asphalt.

G. Rolling and Compaction

1. Compaction shall be started immediately after spreading. Rollers shall be types approved by the Engineer. Rolling shall be a continuous process, and all parts of the pavement shall receive uniform compaction.
2. All pavement thicknesses referred to herein are compacted thicknesses. The Contractor shall place sufficient mix to ensure that the specified thickness of pavement occurs wherever called for.
3. After the paving mixture has been properly spread, initial compaction shall be obtained by the use of power rollers weighing not less than 240 pounds per inch width of tread.
4. Final compaction of the surface shall be accomplished by rollers weighing not less than 283 pounds per inch width of tread. Along curbs, structures and all places not accessible with a roller, the mixtures shall be thoroughly compacted with tampers. Such tampers shall not weigh less than 25 pounds and shall have a tamping face of not more than 50

square inches. The surface of the mixture after compaction shall be smooth and true to the established line and grade.

H. No vehicular traffic or loads shall be permitted on the newly completed pavement until adequate stability has been attained and the material has cooled sufficiently to prevent distortion or loss of fines. If the climatic or other conditions warrant it, the period of time before opening to traffic may be extended at the discretion of the Engineer.

3.4 TOLERANCES

A. Flatness: Maximum variation of 1/4 inch measured with 10 feet straight edge.

B. Scheduled Compacted Thickness: Within 1/4 inch.

C. Variation from Indicated Elevation: Within 1/2 inch.

3.5 FIELD QUALITY CONTROL

A. Take samples and perform tests in accordance with New York Department of Transportation Standard Specifications.

B. Asphalt Paving Mix Temperature: Measure temperature at time of placement.

C. Asphalt Paving Thickness: ASTM D3549; test one core sample from every 1000 square yards compacted paving.

D. Asphalt Paving Density: ASTM D1188 or ASTM D2726; test one core sample from every 1000 square yards compacted paving.

E. Asphalt Paving Density: ASTM D2950 nuclear method; test one location for every 1000 square yards compacted paving.

3.6 PROTECTION

A. Immediately after placement, protect paving from mechanical injury for 12 hours or until surface temperature is less than 140 degrees F.

B. Do not allow vehicular traffic or loads on the newly completed pavement until adequate stability has been attained and the material has cooled sufficiently to prevent distortion or loss of fines. If the climatic or other conditions warrant it, the period of time before opening to traffic may be extended at the discretion of the Engineer.

SECTION 321623 – ASPHALT SIDEWALKS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Asphalt sidewalks and pedestrian walkways

B. Preparation of subgrade and aggregate subbase associated with asphalt sidewalk construction

C. Related Requirements:

1. Section 312213 “Rough Grading” for preparation of Site for paving and base grade.
2. Section 312323 “Fill” for compacted subgrade for paving.
3. Section 321123 “Aggregate Base Courses” for base course.

1.3 QUALITY ASSURANCE

A. Asphalt sidewalk materials and construction shall conform to NYSDOT Standard Specifications Section 608 and applicable requirements of Sections 401 and 404.

B. Obtain materials from same source throughout.

C. Qualifications

1. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' documented experience.
2. Installer: Company specializing in performing Work of this Section with minimum three years' documented experience.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.

2. Provide additional protection according to manufacturer instructions.

1.5 EXISTING CONDITIONS

A. Verify existing grades, elevations, utility structures, curb elevations, building entrances, and adjacent pavement before beginning Work.

B. Notify Engineer of conditions that would prevent construction to the lines, grades, slopes, or elevations indicated on the Drawings.

PART 2 - PRODUCTS

2.1 AGGREGATE SUBGRADE

A. As specified in Section 321123 “Aggregate Base Courses”.

2.2 MATERIALS

A. Asphalt Paving mixture: Provide asphalt mixture conforming to the applicable requirements of NYSDOT Standard Specifications Sections 401, 404, and 608.

1. Sidewalk Wearing Course: NYSDOT 9.5 Top Course asphalt mixture
2. Compacted thickness: 2 inches, unless otherwise indicated on the Drawings
3. Asphalt mixture shall be produced from an approved Job Mix Formula (JMF) in accordance with NYSDOT requirements.
4. Asphalt binder, aggregates, mineral filler, and additives shall conform to the requirements of NYSDOT Section 700 Materials Details.
5. Height: Equal to full depth of finished sidewalk.

B. Aggregate Base Course

1. Aggregate base shall conform to NYSDOT section 304, Type 2 Subbase Course.
2. Compacted Thickness:

    a. 6 inches minimum unless otherwise indicated on the Contract Drawings
    b. Aggregate shall be placed and compacted in accordance with NYSDOT Section 304

C. Tack Coat

1. Tack coat shall conform to NYSDOT Section 407
2. Apply tack coat to all existing asphalt and concrete surfaces that will be in contact with new asphalt pavement

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Section 017300 “Execution”: Requirements for installation examination.

B. Verify that compacted subgrade is dry and ready to support paving and imposed loads.

C. Verify that gradients and elevations of subgrade are as indicated on Drawings.

3.2 PREPARATION

A. Section 017300 “Execution”: Requirements for installation preparation.

B. Subgrade preparation shall conform to NYSDOT standards.

C. Aggregate base course shall conform to NYSDOT Section 304

D. Correct soft, yielding, or unstable areas prior to paving.

3.3 INSTALLATION

A. Subgrade:

1. As specified in Section 321123 “Aggregate Base Courses”.”

B. Weather Limitations:

1. Do not place asphalt when:

a. Air temperature is below 40 degrees Fahrenheit.
b. Surface is wet, frozen, or unstable
c. Weather conditions are unsuitable for proper compaction.

C. Tack Coat

1. Apply tack coat in accordance with NYSDOT Section 407 where new asphalt is placed against existing pavement, curbs, structures, or concrete surfaces

D. Asphalt Placement

1. Place asphalt pavement in accordance with NYSDOT section 401
2. Spread and compact asphalt mixture to the required section, thickness, grade, and cross slope.
3. Compact asphalt pavement using equipment capable of achieving the required density.
4. Finished sidewalk thickness shall be 2 inches minimum compacted thickness.

E. ADA Requirements

1. Sidewalk cross slope shall not exceed 2.0 percent
2. Running slope shall conform to the drawings and ADA requirements
3. Provide smooth transitions at driveways, curb ramps, and sidewalk connections.

3.4 TOLERANCES

A. Maximum Variation of Surface Flatness: 1/4 inch in 10 feet.

B. Maximum Variation from True Position: 1/2 inch.

3.5 FIELD QUALITY CONTROL

A. Section 017300 “Execution”: Requirements for testing, adjusting, and balancing.

B. Inspection and Testing:

1. Inspect temporary asphalt sidewalk prior to opening for access use and periodically during construction.
2. Verify asphalt mixture furnished is NYSDOT 9.5 Top Course and is obtained from an approved production source.
3. Verify the prepared subgrade and aggregate subbase are firm, stable, properly graded, and adequately compacted prior to asphalt placement.
4. Asphalt Thickness:
    a. Provide minimum 2-inch compacted thickness, unless otherwise indicated on the Drawings.
    b. Verify thickness during placement by depth checks or material yield.
    c. Asphalt cores are not required unless directed by the Engineer.
5. Aggregate Subbase:
    a. Provide minimum 6-inch compacted thickness of NYSDOT Type 1 Subbase Course, unless otherwise indicated on the Drawings.
    b. Compact to provide a firm and stable surface with no visible yielding, pumping, rutting, or displacement.
6. Compaction:
    a. Compact asphalt with suitable rolling equipment to provide a dense, smooth, stable surface.
    b. Continue compaction until roller marks, displacement, and other objectionable surface irregularities are eliminated.
    c. Field density testing is not required unless directed by the Engineer.
7. Surface Tolerance:
    a. Maximum variation in finished surface: 1/4 inch in 10 feet when measured with a straightedge.
    b. Correct surface irregularities that create tripping hazards, interfere with drainage, or adversely affect accessibility.

8. Drainage: Provide positive drainage.
9. Where the temporary sidewalk serves as an accessible pedestrian route, maintain applicable accessible width, running slope, cross slope, changes in level, and transition requirements throughout the duration of temporary use.
10. Inspection During Temporary Use:

    a. Inspect temporary sidewalk regularly and following construction activities that may damage or obstruct the pedestrian route.
    b. Repair settlement, rutting, cracking, loose material, abrupt changes in level, ponding, or other conditions that create a pedestrian hazard.
    c. Keep temporary sidewalk free of construction debris, equipment, stored materials, snow, ice, and other obstructions.

11. Do not open temporary asphalt sidewalk to pedestrian traffic until the asphalt has cooled and hardened sufficiently to prevent displacement, scuffing, or deformation.

3.6 ATTACHMENTS

A. Asphalt Sidewalk: NYSDOT 9.5 Top Course asphalt mixture over NYSDOT Subbase Course, Type 1; thicknesses as indicated on the Drawings.

SECTION 329200 - TURF AND GRASSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Seeding.
2. Turf renovation.

1.3 DEFINITIONS

A. Finish Grade: Elevation of finished surface of planting soil.

B. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth. See Section 329113 "Soil Preparation" and drawing designations for planting soils.

C. Subgrade: The surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape installer whose work has resulted in successful turf establishment:

1. Experience: Three years' experience in turf installation in addition to requirements in Section 014000 "Quality Requirements."
2. Pesticide Applicator: State licensed, commercial.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Seed and Other Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws, as applicable.

B. Sod: Harvest, deliver, store, and handle sod according to requirements in the Turfgrass Producers International’s (TPI) "Specifications for Turfgrass Sod Materials" and "Specifications for Turfgrass Sod Transplanting and Installation" sections in TPI's "Guideline Specifications to

Turfgrass Sodding." Deliver sod within 24 hours of harvesting and in time for planting promptly. Protect sod from breakage and drying.

C. Bulk Materials:

1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
2. Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
3. Accompany each delivery of bulk materials with appropriate certificates.

1.6 FIELD CONDITIONS

A. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with initial maintenance periods to provide required maintenance from date of Substantial Completion:

1. Spring Planting: April 1.
2. Fall Planting: August 1.

B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.

PART 2 - PRODUCTS

2.1 SEED FOR GENERAL LAWN/RECREATION AREAS

A. Grass Seed: Fresh, clean, dry, new-crop seed complying with Association of Official Seed Analysts (AOSA's) "Rules for Testing Seeds" for purity and germination tolerances.

B. Seed Species:

1. Quality: State-certified seed of grass species as listed below for solar exposure.
2. Sun and Partial Shade – Seed Mixture #1 – In accordance with the New York State Standards and Specifications for Erosion and Sediment Control (Blue Book), Permanent Construction Area Planting, Table 4.4. Proportioned application rates, based on Pure Live Seed (PLS), shall be as follows:

   a. Creeping Red Fescue (Festuca rubra), Ensylva, Pennlawn, or Boreal variety, applied at a rate of 10 lbs/acre (0.25 lb/1,000 SF).
   b. Perennial Ryegrass (Lolium perenne), Pennfine or Linn variety, applied at a rate of 10 lbs/acre (0.25 lb/1,000 SF).
   c. Total seed mixture application rate shall be 20 lbs/acre (0.50 lb/1,000 SF), PLS.

3. Acceptable Suppliers:

a. Pinelands Nursery & Supply.
b. Ernest Seeds.
c. Or Approved Equal.

2.2 FERTILIZERS

A. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:

1. Composition: Applied at a rate of 500 pounds per acre or 11 pounds per 1,000 square feet of 10-10-10 or equivalent with 50% water insoluble nitrogen.
2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.

2.3 LIME

A. Description: Agricultural limestone containing a minimum of 80 percent calcium carbonate equivalent.

B. Comply with ASTM C602.

C. Class: T.

1. Class: T, with a minimum of 99 percent passing through a No. 8 sieve and a minimum of 75 percent passing through a No. 60 sieve.

2.4 MULCHES

A. Straw Mulch: Provide air-dry, clean, mildew- and seed-free, salt hay or threshed straw of wheat, rye, oats, or barley.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to be planted for compliance with requirements and other conditions affecting installation and performance of the Work:

1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
2. Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
3. Uniformly moisten excessively dry soil that is not workable or which is dusty.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

3.2 PREPARATION

A. Protect structures; utilities; sidewalks; pavements; and other facilities, trees, shrubs, and plantings from damage caused by planting operations:

1. Protect grade stakes set by others until directed to remove them.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.3 LIMING AND FERTILIZING

A. Apply lime at application rate recommended by soil analysis.

B. Work lime into top 4 inches of soil.

C. Apply fertilizer at application rate 500 pounds per acre or 11 pounds per 1,000 Square Feet.

D. Apply fertilizer after smooth raking of topsoil.

E. .Mix fertilizer thoroughly into upper 4 inches of topsoil.

F. Lightly water soil to aid dissipation of fertilizer.

3.4 TURF AREA PREPARATION

A. General: Prepare planting area for soil placement and mix planting soil according to Section 329113 "Soil Preparation."

B. Placing Planting Soil: Place and mix planting soil in place over scarified and exposed subgrade.

1. Reduce elevation of planting soil to allow for soil thickness of sod.

C. Moisten prepared area before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

D. Before planting, obtain Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.5 SEEDING

A. Sow seed with spreader or seeding machine. Do not broadcast or drop seed when wind velocity exceeds 5 mph:

1. Evenly distribute seed by sowing equal quantities in two directions at right angles to each other.
2. Do not use wet seed or seed that is moldy or otherwise damaged.
3. Do not seed against existing trees. Limit extent of seed to outside edge of planting saucer.

B. Sow seed at a total rate of 2 lb/1000 sq. ft.

C. Rake seed lightly into top 1/8 inch of soil, roll lightly, and water with fine spray.

D. Protect seeded areas with slopes exceeding 1:4 with erosion-control blankets installed and stapled according to manufacturer's written instructions.

E. Protect seeded areas with erosion-control mats where indicated on Drawings; install and anchor according to manufacturer's written instructions.

F. Protect seeded areas with slopes not exceeding 1:6 by spreading straw mulch. Spread uniformly at a minimum rate of 2 tons/acre to form a continuous blanket 1-1/2 inches in loose thickness over seeded areas. Spread by hand, blower, or other suitable equipment:

1. Anchor straw mulch by crimping into soil with suitable mechanical equipment.

G. Protect seeded areas from hot, dry weather or drying winds by applying straw mulch within 24 hours after completing seeding operations. Soak areas, scatter mulch uniformly to a thickness of 3/16 inch, and roll surface smooth.

3.6 TURF RENOVATION

A. Renovate turf damaged by Contractor's operations, such as storage of materials or equipment and movement of vehicles:

1. Reestablish turf where settlement or washouts occur or where minor regrading is required.
2. Install new planting soil as required.

B. Remove sod and vegetation from diseased or unsatisfactory turf areas; do not bury in soil.

C. Remove topsoil containing foreign materials, such as oil drippings, fuel spills, stones, gravel, and other construction materials resulting from Contractor's operations, and replace with new planting soil.

D. Mow, dethatch, core aerate, and rake existing turf.

E. Remove weeds before seeding. Where weeds are extensive, apply selective herbicides as required. Do not use pre-emergence herbicides.

F. Remove waste and foreign materials, including weeds, soil cores, grass, vegetation, and turf, and legally dispose of them off Owner's property.

G. Till stripped, bare, and compacted areas thoroughly to a soil depth of 6 inches.

H. Apply initial fertilizer required for establishing new turf and mix thoroughly into top 4 inches of existing soil. Install new planting soil to fill low spots and meet finish grades.

I. Apply seed and protect with straw mulch as required for new turf.

J. Water newly planted areas and keep moist until new turf is established.

3.7 TURF MAINTENANCE

A. General: Maintain and establish turf by watering, fertilizing, weeding, mowing, trimming, replanting, and performing other operations as required to establish healthy, viable turf. Roll, regrade, and replant bare or eroded areas and re-mulch to produce a uniformly smooth turf. Provide materials and installation the same as those used in the original installation.

1. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace materials and turf damaged or lost in areas of subsidence.
2. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch and anchor as required to prevent displacement.
3. Apply treatments as required to keep turf and soil free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards.

B. Watering: Install and maintain temporary piping, hoses, and turf-watering equipment to convey water from sources and to keep turf uniformly moist to a depth of 4 inches:

1. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.
2. Water turf with fine spray at a minimum rate of 1 inch per week unless rainfall precipitation is adequate.

C. Mow turf as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than one-third of grass height. Remove no more than one-third of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowings to maintain the following grass height:

1. Mow to a height of 1-1/2 to 2 inches.

3.8 SATISFACTORY TURF

A. Turf installations shall meet the following criteria as determined by Architect:

1. Satisfactory Seeded Turf: At end of maintenance period, a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 10 sq. ft. and bare spots not exceeding 5 by 5 inches.
2. Satisfactory Sodded Turf: At end of maintenance period, a healthy, well-rooted, even-colored, viable turf has been established, free of weeds, open joints, bare areas, and surface irregularities.

3. Satisfactory Plugged Turf: At end of maintenance period, the required number of plugs has been established as well-rooted, viable patches of grass, and areas between plugs are free of weeds and other undesirable vegetation.
4. Satisfactory Sprigged Turf: At end of maintenance period, the required number of sprigs has been established as well-rooted, viable plants, and areas between sprigs are free of weeds and other undesirable vegetation.

B. Use specified materials to reestablish turf that does not comply with requirements, and continue maintenance until turf is satisfactory.

3.9 CLEANUP AND PROTECTION

A. Promptly remove soil and debris created by turf work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of them off Owner's property.

C. Erect temporary fencing or barricades and warning signs as required to protect newly planted areas from traffic. Maintain fencing and barricades throughout initial maintenance period and remove after plantings are established.

D. Remove nondegradable erosion-control measures after grass establishment period.

3.10 MAINTENANCE SERVICE

A. Turf Maintenance Service: Provide full maintenance by skilled employees of landscape Installer. Maintain as required in "Turf Maintenance" Article. Begin maintenance immediately after each area is planted and continue until acceptable turf is established, but for not less than the following periods:

1. Seeded Turf: 120 days from date of planting completion:

    a. When initial maintenance period has not elapsed before end of planting season, or if turf is not fully established, continue maintenance during next planting season.

B. Meadow Maintenance Service: Provide full maintenance by skilled employees of landscape Installer. Maintain as required in "Meadow Maintenance" Article. Begin maintenance immediately after each area is planted and continue until acceptable meadow is established, but for not less than maintenance period below:

1. Maintenance Period: 120 days from date of planting completion.

SECTION 330130.70 - SPRAY-IN-PLACE POLYMERIC PIPE LINING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. “Spray-in-place polymeric” pipe lining.
2. Pre-inspection and post-inspection closed camera television inspection of piping to be rehabilitated.
3. Cleaning, rehabilitation, removal of obstructions and protruding service connections prior to complete pipe lining rehabilitation.

B. Provide materials, labor, equipment, and QA/QC to clean, prepare, and apply a 100%-solids epoxy SIPP liner to the interior of existing pressure pipe to achieve an AWWA Class III design with inherent ring stiffness (semi-structural/interactive). The work includes flow bypassing, access, cleaning, lining, testing, disinfection, and commissioning. Class III means the liner has its hoop strength and does not rely on adhesion for pressure containment, while still interacting with the host pipe.

1.3 ABBREVIATIONS AND DEFINITIONS

A. SIPP: Spray-in-place polymeric.

B. CCTV: Closed-circuit television.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site. Discuss following as a preliminary meeting agenda:

1. Preparatory activities before installing SIPP materials, including submittals, delegated design, notification to property owners, material storage, videos, and other specified actions.
2. Installation and testing procedures.
3. Post installation activities, including videos, cleanup, and repairs.

1.5 ACTION SUBMITTALS

A. Product Data: Identify construction materials including resins and other system components. Identify manufacturer and their location for coating material, including recommended repair and patching procedures, if applicable.

B. Manufacturers' shipping, storage and handling recommendations for SIPP system components.

C. Safety Plan: Provide a Safety Plan identifying persons, a description of a daily safety program for job site and emergency procedures to be implemented in the event of a safety incident. Conduct work in accordance with submitted Safety Plan.

D. Quality Control Plan: Provide a detailed quality control plan (QCP) that fully represents and conforms to following as a minimum:

1. A detailed discussion of proposed quality controls to be performed.
2. Defined responsibilities to specific personnel for assuring that quality requirements for this Contract are met.
3. Define proposed procedures for quality control including those pertaining to fit and finish, and product sampling and testing.
4. Proposed methods for product performance controls, including method of and frequency of product sampling and testing both in raw material form and cured product form.
5. A schedule for performance and product test result reviews between Contractor and Owner/Engineer at a regularly scheduled job meeting.
6. Prepare inspection forms and guidelines for quality control inspections in accordance with specified standards and submitted with QCP.

E. Shop Drawings:

1. Include plans, elevations, sections, and attachment details.
2. Identify work scope locations, construction details, pipe diameters, traffic control measures, and related activities.
3. Design package sealed by a Professional Engineer experienced in pressure-pipe renewal:

a. Liner class confirmation (Class III) and minimum finished thickness (MFT) calculation.
b. Design internal pressure ▶50 psi; test pressure ▶75 psi; surge/transients.
c. Host pipe data (material, ID, ovality, pits/voids, joints), gap/hole spanning checks, and ring stiffness basis.
d. Termination details (ends, appurtenances, services) and any local reinforcement.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, manufacturer, and testing agency.

1. Installer:

a. References: Names and telephone numbers of contacts to verify previous satisfactory performance.
b. Work Description: Full description of work performed.

c. SIPP Coating Manufacturer and Supplier: Names for each referenced project.
d. Supervisor or Foreman / Lead Personnel: Verifiable references.

2. Manufacturer:

a. Names and Product Information: SIPP coating materials to be utilized for this project and their suppliers.
b. Certified Statement from Manufacturer: Contractor is an approved installer as certified or licensed by the SIPP lining manufacturer.

3. Testing Laboratory:

a. Name and address of laboratory.
b. Certified statement from laboratory indicating that they are independent from and not associated with Contractor in any way, and A2lA certification for independent testing laboratory.

B. Material Certificates: For each type of spray-in-place pipe lining.

C. Material Test Reports: For each spray-in-place pipe lining, by a qualified testing agency.

D. Product Test Reports: For each cured-in-place pipe lining, for tests performed by manufacturer and witnessed by a qualified testing agency.

E. QA/QC plan: cleaning verification, DFT/DFW (dry film thickness/wet film), cure, holiday, adhesion, and water quality testing.

F. Source quality control reports.

G. Disposal reports. Submit documentation of the work that is performed and the type of debris removed, as well as landfill permits and disposal documentation.

H. Field quality-control reports.

I. Sample Warranty: For manufacturer's warranty.

1.7 QUALITY ASSURANCE

A. Installer Qualifications:

1. Successfully installed a minimum of 250,000 feet of proposed SIPP lining in pipe of a similar size, length, and configuration as specified and documented by verifiable references.

a. Experience in Installing SIPP Lining: 5 years.
b. Municipal Clients: Minimum five clients that SIPP Contractor has performed specified type of work for without defects or performance problems for a period of five years after installation:

2. On-Site Superintendent or Foreman: Full-time supervisor of SIPP lining installation, having successfully installed a minimum of 100,000 feet of proposed size range of SIPP lining for a minimum of five years.
3. Lead Personnel: Including superintendent, foreman, and lead crew personnel each having a minimum of three years of total experience with SIPP technology proposed and demonstrating competency and experience as documented by verifiable references.

B. Manufacturer Qualifications:

1. SIPP Coating Manufacturers: Successfully supplied a minimum of 500,000 feet of proposed lining and one million pounds of coatings as documented by verifiable references.

C. Material Certifications:

1. Independent Testing Laboratory Analysis of Lining Materials: Five reports from projects within past two years showing modulus of elasticity as determined by appropriate ASTM standard, and flexural stress as determined by ASTM D790 standard.

D. Preconstruction mockup to demonstrate surface prep, application, and QA tests.

E. Third-party inspection for critical holds: post-prep, after each pass, and final cure.

F. Owner or Engineer reserves the right to approve or disapprove Contractor and staff and Manufacturer based on submitted qualifications and follow-up interviews.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Maintain SIPP lining materials at a proper temperature in refrigerated facilities to prevent premature curing prior to installation. Protect SIPP lining materials from UV light. Reject SIPP lining materials showing evidence of premature curing and immediately removed from site.

B. Inspections of SIPP lining materials may also be made by Engineer or other representatives of Owner after delivery. SIPP lining materials are subject to rejection at any time on account of failure to meet any of specified requirements, even though sample SIPP lining may have been accepted as satisfactory at place of manufacture. Mark rejected materials after delivery for identification and remove from the job site.

1.9 WARRANTY

A. Special Warranty: Manufacturer and Installer agree to repair or replace components of sprayed-in-place pipe lining that fail in materials or workmanship within specified warranty period.

1. During this period, serious defects discovered in SIPP lining, as determined by Engineer and which may materially affect the integrity, strength, function or pipe operation, must be removed and replaced as recommended by manufacturer in a satisfactory manner.
2. Remove and repair defects in a manner that is satisfactory to Owner and Engineer. Defects include but not limited to the following:

a. Leakage through lining or between lining and pipe.

b. Reduction of lining thickness of more than ten percent of thickness design. Deliver final lining thickness based on installed product physical properties and as specified in Contract Documents.
c. Structural strength below the required limits.

B. At its own expense, Owner may conduct an independent CCTV inspection of SIPP lining work prior to completion of warranty period. Defects replaced at that time must be fully warranted by Contractor and manufacturer for a period of two years from date the defect was repaired.

1. Repair or replace wrinkles in flow stream, blisters that may affect the longevity of SIPP lining or other defects that may affect the integrity or strength of the SIPP or the flow capacity of the pipe.
2. Warranty Period: One year from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following or equal:

1. Warren Environmental, Inc.
2. Inlining by Layne Inlining, Inc.
3. Insituform by Insituform Technologies, Inc.
4. National Lining by National EnviroTech Group LLC.
5. SAK Lining by SAK Construction LLC.
6. Sancon SIPP by Sancon Engineering Inc.
7. Invert-a-Pipe by Inland Pipe Rehabiliatation.
8. Premier Pipe USA.

B. Source Limitations: Obtain all components and accessories for SIPP system from single manufacturer or products from a secondary manufacturer as approved by primary manufacturer.

2.2 SYSTEM REQUIREMENTS

A. SIPP Lining and Appurtenances:

1. Removal of obstructions to complete SIPP rehabilitation. Complete removal of pipeline obstructions and protruding service connections required for sewer rehabilitation using sprayed-in-place pipe lining prior to pre-rehabilitation CCTV inspection.
2. Verify neither SIPP system nor its installation causes adverse effects to any of Owner’s processes or facilities.

a. Product use shall not result in formation or production of detrimental compounds or by-products in the system or at wastewater treatment plant.
b. Notify Owner and identify any by-products produced as a result of installation operations, test and monitor levels, and comply with local waste discharge requirements.

c. Cleanup, restore existing surface conditions and structures, and repair SIPP system determined to be defective. Conduct installation operations and schedule cleanup in a manner to cause minimize inconvenience to traffic, pedestrians, businesses, and property Owners or tenants.

3. Do not change any material, design values, or procedural matters stated or approved, without informing Engineer and receiving written approval of the change. Such changes constitute a breach of contract and will result in rejection and removal of work performed with unapproved materials or processes. Replace with new materials and specified requirements.

2.3 MATERIALS

A. EPOXY LINING MATERIALS

1. All SIPP epoxy lining materials shall be 2 part components consisting of a base and activator, which shall be stored in separate tanks, with their temperatures regulated in accordance with the epoxy manufacturers' recommendations. Material shall be 301-14 High Performance Epoxy, rated for solids and grit laden wastewater, as manufactured by Warren Environmental or approved equal.
2. Two-component, 100%-solids epoxy formulated for centrifugal/spray robotic application inside pressure pipe; 100% solids, solvent free, zero VOC, structurally enhancing epoxy proven safe for aquatic life.. Examples exist on the market (owner to approve equals), but the spec is performance-based.
3. Viscosity, pot life, recoat, and cure are compatible with ambient conditions and access length.
4. The standard application thickness for each lining shall be at least 3MM.
5. Material shall be stored in accordance with manufacturers' guidelines, any previously opened material needs to be thoroughly inspected prior to use.
6. Material must be NSF-61 potable water certified.
7. Color: Light color preferred for inspection.
8. Compatibility with Ductile Iron Pipe. AWWA C620 epoxy.

B. SAFETY

1. All SIPP Installation processes shall adhere to all MSDS sheets, manufacturer's safety guidelines and be performed within strict conformance of all Federal, State and Local agencies having jurisdiction.
2. All Proper and recommended protective equipment and clothing shall be worn at all times to ensure the safety of all working on the project.
3. All related work shall be expedited by trained teams. All employees are to be confined space certified with a minimum 10 hour OSHA training certification. All OSHA standards must be strictly adhered to.

2.4 EQUIPMENT

A. SIPP PIPE LINING EQUIPMENT

1. Computer-controlled SIPP rig with rotational spray head and linear travel control, capable of consistent MFT over the specified pipe.
2. Surface prep tools: mechanical cleaning (abrasive blast or equivalent) to achieve the specified profile; debris capture and HEPA filtration.
3. SIPP Pipe Lining Rig shall be a computerized and fully automated capable of lining up to 600 feet in one lining application.
4. SIPP Pipe Lining spray head shall be able to spray material at 10,000 rpm and apply an epoxy coating evenly throughout the entire length of pipe that is in the contracted scope of work. Model to be proprietary and capable of lining varying pipe sizes during one lining pass applying an even thickness throughout each varying pipe dimension.
5. The Pipe Lining Equipment will be controlled with a computer operated system control that will monitor the flow characteristics of the lining material as it flows through the machine for constant quality control. The system will have automatic alarms in place to allow the machine to abort lining should any abnormalities occur during the process.

B. VIDEO INSPECTION EQUIPMENT

1. Real-time logging of travel speed, pump pressures, mix ratio, and WFT.
2. A CCTV Camera shall be able to enter the pipe of varying sizes larger than 1 1/4 inches, and travel throughout recording video, images and profiles to be used in programming of the lining rig for the lining application. The camera shall be in full color and have adjustable light to be able to see all areas of the interior of the pipe to be lined.

2.5 SOURCE QUALITY CONTROL

A. Provide SIPP lining materials from a single source.

B. Owner or an agent of Owner may inspect SIPP lining manufacturing. Give Owner or its agent an opportunity to witness manufacturing of project SIPP lining materials. Provide full access to witness process and provide information related to manufacturing as requested by Owner or Owner’s agent without delay and without claims of confidentiality or product privacy

C. Owner is responsible for costs associated with witnessing the manufacturing and plant inspection of SIPP linings.

PART 3 - EXECUTION

3.1 PREPARATION

A. The Contractor is responsible to procure water as necessary for this work. Obtain approval from Owner, Engineer, and Owner’s Contract Operator for use of existing facilities.

B. Clean each length of pipe to be lined and dispose of resulting residual material offsite in a manner acceptable to Owner and Engineer. Remove tuberculation and deposits; achieve

substrate cleanliness/profile suitable for epoxy per manufacturer (typically near-white metal for ferrous; sound, open-pore surface for concrete).

C. Conduct a pre-rehabilitation CCTV inspection of piping to be rehabilitated by SIPP lining methods. Perform inspection to identify pipe defects, to document location of valves, fittings, and to confirm point repair locations.

1. Ensure project manager or superintendent review of pre-rehabilitation inspection videos to confirm its quality, locations of valves and fittings, and locations of point repairs to be performed using compatible filler before lining (or account for gap spanning in design).

D. Submit video only after confirmation that quality is adequate for a clear review of pipeline. Engineer will review pre-rehabilitation inspection videos to confirm locations of point repairs to be performed. If an Inspector or Engineer is on site or immediately available, allow viewing of pre-installation video to verify the pipe is ready for SIPP installation which includes proper cleaning, trimming protruding taps, and mitigating significant infiltration.

E. Provide SIPP lining in full length of force main as shown on work orders.

3.2 PIPE CLEANING AND SURFACE PREP

A. An opening at both ends of the subject pipe for access is required to allow access and egress for cleaning equipment.

B. Surface preparation methods shall be based upon the conditions of the substrate and the requirements of the spray in place pipe lining system.

C. Surfaces to receive protective coatings shall be prepared as indicated prior to application of coatings. The CONTRACTOR shall examine surfaces to be coated and shall correct surface defects before the application of any coating material.

D. Protection of Surfaces Not to be Coated: Surfaces that are not to receive protective coatings shall be protected during surface preparation, cleaning, and coating operations.

E. Care shall be exercised not to damage adjacent WORK during blasting operations. Spraying shall be conducted under carefully controlled conditions. The CONTRACTOR shall be fully responsible for and shall promptly repair any and all damage to adjacent WORK or adjoining property occurring from blasting or coating operations.

F. Protection of Painted Surfaces: Cleaning and coating shall be coordinated so that dust and other contaminants from the preparation process will not fall on wet, newly coated surfaces.

G. Available methods include but are not limited to Hydro-jetting, pigging and brushing.

H. Upon completion of the cleaning process the pipe shall be showered with compressed air to remove any leftover debris

I. Properly dispose of all sanitary debris and material from cleaning, preparation, inspection, and SIPPL operations.

© 2026 CDM Smith
All Rights Reserved

3.3 INSTALLATION

A. Install SIPP lining via self-propelling lining device or via operator controlled application rig.

B. Closely follow requirements in submitted lining reports, including minimum inversion pressure, ideal head, maximum hot head, and maximum cold head for each installation.

C. Vent or exhaust noxious fumes or odors generated during and remaining after curing process is completed. Remain process in place until noxious odors have dissipated to an acceptable level in accordance with OSHA requirements for materials used. Maintain until there is no more air pollution or potential health hazard left to general public or construction workers.

D. All surfaces shall be inspected during and after preparation and before application of the monolithic surfacing system. Any evidence of remaining contamination or laitance shall be removed by high-pressurewater, abrasive blast, or other approved method before proceeding with applying the monolithic surfacing system.

E. The epoxy coatings shall be placed and cured in a single application.

F. Application procedures shall conform to the recommendations of the structural epoxy manufacturer, including material handling, mixing, and environmental controls during the application, safety, and equipment.

G. The equipment shall be specially designed to accurately ratio and apply the specified materials and shall be regularly maintained and in proper working order.

H. The specified materials must be applied by manufacturer-approved workmen.

I. All specified surfaces will be coated with the structural epoxy system to provide a minimum total thickness of 250 mils for rehabilitated structures and 125 mils for new concrete structures. The epoxy liner shall be monolithic with proper sealing of connections to all unsurfaced areas and shall be placed and cured in one application.

3.4 LINING

A. The pipe matrix will be entered into the computer control system, mapping any abnormalities and/or imperfection into the pipe. This will allow the controls of the system to apply more or less epoxy material at the particular points noted.

B. The pipe is to be lined using the entrance and exit as needed along the matrix.

C. The SIPP Lining Rig shall have the umbilical pulled the length of the pipe to be lined where the spray head will be attached, capable of lining up to 600 feet in one pass.

D. The lining head will be implemented in an enclosure at the exit of the pipe matrix. The material flow and mix ratio will be checked for abnormalities as a final physical quality control measure prior to the lining head's entry.

E. The lining head is entered into the pipe matrix and is then left to automated controls of the SIPP Lining Machine. The computer control system is monitored by a pipe lining engineer during the

entire process. The system is monitored at the opening of the pipe as well as monitored from the pipe entrance.

F. During the lining process the Computer control system is required to print off a quality assurance report at a minimum of every 20 seconds. This report must include current mix ratio of material, pressure at which the material is applied, temperature of material, flow rate of material, distance currently in pipe and thickness of material currently being applied to the pipe.

3.5 FIELD TESTING AND ACCEPTANCE

A. Base field acceptance of SIPP lining on Owner's and Engineer's evaluation of installation, including a review of SIPP lining curing data, review of post-rehabilitation CCTV inspection data, and review of certified test data for installed SIPP lining. Complete SIPP sample testing and repairs to installed SIPP before final acceptance, meeting requirements of these specifications and documented in written form.

B. For every 1,000 linear feet of SIPP lining installed, perform sampling and testing to determine installed SIPP lining flexural properties and SIPP lining thickness.

1. Frequency of testing may be reduced as approved by Engineer after sufficient tests are performed to verify SIPP lining design, production, and installation procedures.
2. Thickness: Magnetic DFT measurements at all joints ad midway point of all pipe sections; acceptance ≥ MFT with no local <90% MFT.
3. Holiday testing: 100% of the lined surface using a calibrated high-voltage spark tester; voltage set per thickness; repair and re-test. (AWWA C620 includes inspection provisions; follow the manufacturer and standard.)
4. Adhesion tests to be performed on cast iron or ductile iron plate samples taken at the time of spray: pull-off tests (ASTM D4541) where required; report values; repairs as needed.
5. Hydrostatic/pressure test: Hold at test pressure 75 psi for 2 hr; no leakage/pressure loss beyond 1 psi.

C. Frequency of testing may be increased by Engineer when required tests show that installed SIPP lining does not meet specifications. Where tests fail, reevaluate lining thickness design to determine if installed physical properties meet minimum design requirements. Replace and reline with approval from Engineer without additional compensation.

D. Perform a post-rehabilitation CCTV inspection of force main rehabilitated using SIPP lining methods. Perform post-rehabilitation CCTV inspection following installation of SIPP lining. Review post-rehabilitation inspection videos to confirm the quality of videos and of installed SIPP. Only after confirmation that videos are of good quality, submitted to Engineer. If it is determined that repairs are needed at any segment, perform a new CCTV inspection of the entire segment after completing repairs.

END OF SECTION 330130.70

SECTION 400506 - COUPLINGS, ADAPTERS, AND SPECIALS FOR PROCESS PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Pipe penetrations.
2. Flexible connections.
3. Expansion joints.
4. Sleeve-type couplings.
5. Flange adapter.
6. Dismantling joint.
7. Cartridge filters

B. Related Requirements:

1. Section 055000 “Metal Fabrications”: Miscellaneous metalwork and fasteners as required by this Section
2. Section 078400 “Firestopping”: Penetrations through fire-rated materials
3. Section 079000 “Joint Protection”: Sleeve sealant for pipe penetrations
4. Section 099679 “Atmospheric Protection and Plant Service Areas Coatings”: For painting and coatings product and execution requirements.
5. Section 331300 “Disinfecting of Water Utility Distribution”: Disinfection of potable water piping
6. Section 400507 “Hangers and Supports for Process Piping”: Hangers, anchors, sleeves, and sealing of piping to adjacent structures
7. Section 400519 “Ductile Iron Process Pipe”: Ductile-iron piping materials and appurtenances
8. Section 400523 “Stainless Steel Process Pipe and Tubing”: Stainless steel piping materials and appurtenances
9. Section 400524 “Steel Process Pipe”: Steel piping materials and appurtenances
10. Section 400531 “Thermoplastic Process Pipe”: Plastic piping materials and appurtenances
11. Section 400551 “Common Requirements for Process Valves”: Common product requirements for valves for placement by this Section
12. Section 404213 “Process Piping Insulation”: Piping insulation as required by this Section.

© 2026 CDM Smith
All Rights Reserved

1.3 DEFINITIONS

A. Firestopping (Through-Penetration Protection System): The sealing or stuffing material or assembly placed in spaces between and penetrations through building materials to arrest movement of fire, smoke, heat, and hot gases through fire-rated construction.

B. FM: Factory Mutual Insurance Company; FM Global is the communicative name of the company.

C. WH: Warnock Hersey; indicates compliance to relevant building codes, association criteria, and product safety and performance standards.

1.4 COORDINATION

A. Coordinate Work of this Section with installation of piping, valves and equipment connections specified in other Sections and indicated on Drawings.

1.5 ACTION SUBMITTALS

A. Product Data:

1. Submit manufacturer catalog information for each specified product, including installation instructions.
2. Firestopping: Submit data on product characteristics, performance, and limitation criteria.
3. Flexible Pipe Connectors: Indicate maximum temperature and pressure rating, face-to-face length, live length, hose wall thickness, hose convolutions per foot and per assembly, fundamental frequency of assembly, braid structure, and total number of wires in braid.
4. Expansion Joints: Indicate maximum temperature, pressure rating, and expansion compensation.

B. Shop Drawings:

1. Identification:

a. Submit list of wording, symbols, letter size, and color coding for pipe identification.
b. Comply with ASME A13.1.

2. Indicate restrained joint details and materials.
3. Submit layout drawings showing piece numbers and location, indicating restrained joint locations.
4. Indicate layout of piping systems, including flexible connectors, expansion joints and compensators, loops, offsets, and swing joints.

C. Firestopping Schedule: Submit schedule of opening locations and sizes, penetrating items, and required listed design numbers to seal openings for maintenance of fire-resistance rating of adjacent assembly.

1.6 DELEGATED DESIGN SUBMITTALS

A. Submit signed and sealed Shop Drawings with design calculations and assumptions for:

1. Flexible connectors
2. Expansion joints
3. Pipe Restraints:

a. Determine restrained lengths and submit joint restraint details.
b. Use joint restraint devices specifically designed for applications as described in manufacturer data.

4. Firestopping Engineering Judgments: For conditions not covered by UL- or WH-listed designs, submit judgments by licensed professional engineer suitable for presentation to authority having jurisdiction to accept as meeting fire-protection code requirements.

1.7 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

B. Welder Certificates: Certify welders and welding procedures employed on Work, verifying AWS qualification within previous 12 months.

C. Manufacturer Instructions: Submit special procedures and setting dimensions.

D. Source Quality-Control Submittals: Indicate results of factory tests and inspections.

E. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

F. Qualifications Statements:

1. Submit qualifications for manufacturer, installer, and licensed professional.
2. Submit manufacturer's approval of installer.
3. Welders: Qualify procedures and personnel according to AWS D1.1/D1.1M.
4. American Iron and Steel (AIS): Submit certification indicating compliance with requirements.

1.8 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping appurtenances.

B. Identify and describe unexpected variations to pipe routing or discovery of uncharted utilities.

1.9 QUALITY ASSURANCE

A. Materials in Contact with Potable Water: Certified to NSF Standards 61 and 372.

B. Perform Work according to ASME B31.9 for installation of piping systems and according to AWS D1.1/D1.1M for welding materials and procedures.

C. Perform Work according to ASME B31.3 for installation of piping systems.

D. Through-Penetration Firestopping of Fire-Rated Assemblies:

1. Comply with UL 1479 or ASTM E814.
2. Minimum Positive Pressure Differential: 0.1-inch wgto achieve fire F-ratings and temperature T-ratings as indicated on Drawings, but not less than one hour.
3. Wall Penetrations: Fire F-ratings as indicated on Drawings, but not less than one hour.
4. Floor and Roof Penetrations:

    a. Fire F-ratings and Temperature T-ratings: As indicated on Drawings, but not less than one hour.
    b. Floor Penetrations within Wall Cavities: T-rating is not required.

E. Through-Penetration Firestopping of Non-fire-rated Floor and Roof Assemblies:

1. Materials to resist free passage of flame and products of combustion.
2. Noncombustible Penetrating Items: Noncombustible materials for penetrating items connecting maximum of three stories.
3. Penetrating Items: Materials approved by authorities having jurisdiction for penetrating items connecting maximum of two stories.

F. Fire-Resistive Joints in Fire-Rated Floor, Roof, and Wall Assemblies:

1. Comply with ASTM E1966 or UL 2079.
2. Rating: As indicated on Drawings for assembly in which joint is installed.

G. Fire-Resistive Joints between Floor Slabs and Exterior Walls:

1. Comply with ASTM E119.
2. Minimum Positive Pressure Differential: 0.1-inch wg to achieve fire-resistance rating as indicated on Drawings for floor assembly.

H. Surface-Burning Characteristics: Maximum 25/450 flame-spread/smoke-developed index when tested according to ASTM E84.

1.10 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' documented experience.

B. Installer: Company specializing in performing Work of this Section with minimum five years' documented experience.

C. Welders: AWS qualified within previous 12 months for employed weld types.

D. Licensed Professional: Professional engineer experienced in design of specified Work and licensed in State of New York.

© 2026 CDM Smith
All Rights Reserved

1.11 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Furnish temporary end caps and closures on piping and fittings and maintain in place until installation.
3. Provide additional protection according to manufacturer instructions.

1.12 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.13 WARRANTY

A. Furnish one-year manufacturer's warranty for products supplied under this Section.

PART 2 - PRODUCTS

2.1 PIPE PENETRATIONS

A. Performance and Design Criteria:

1. Firestopping Materials: As specified in Section 078400 “Firestopping”.
2. Firestop interruptions to fire-rated assemblies, materials, and components.
3. Firestopping: Provide certificate of compliance from authority having jurisdiction, indicating approval of materials used.

2.2 PIPE SLEEVES

A. All construction except new concrete walls:

1. Material: Schedule 40 galvanized steel conforming to ASTM A53.
2. 2-inch minimum circumference water stop welded on both sides to exterior sleeve at midpoint of wall
3. Ends cut and ground to be:

a. Flush with ground.

b. Flush with ceiling.
c. 2 inches above finished floors.
d. Sealed with caulking.
e. Sized as required.

B. New concrete walls with pipes up to 20 inches in diameter:

1. Material: non-metallic High-Density Polyethylene Sleeves (HDPE).
2. Integral hollow molded water stops.

a. 4 inches larger than the outside diameter of the sleeve.

3. End caps for forming and reinforcing ribs.
4. Century-Line as manufactured by Pipeline Seal & Insulator, Inc., Houston, TX, or equal.

C. New concrete with pipes 20 to 60 inches in diameter:

1. Material: molded HDPE modular interlocking discs to make the width of the wall

a. Corrugated to prevent water migration between sleeve and concrete.
b. Cell-Cast as manufactured by Pipeline Seal & Insulator, Inc., Houston, TX, or equal.

D. External wall penetrations:

1. 36 -in diameter and less may be made by means of a ductile iron sleeve capable of being bolted directly to the formwork:
2. Seal of the annular space between the carrier pipe and the sleeve made by means of a confined rubber gasket and be capable of withstanding 350 psi.:
3. Sleeve to have an integrally cast waterstop of 1/2-in minimum thickness, 2-1/2-in minimum height.
4. Manufacturers: Omni-Sleeve, Malden, MA or equal.

2.3 WALL CASTINGS

A. Ductile iron conforming to ANSI/AWWA A21.51/C151, thickness Class 53.

B. Diameter as required.

C. Flanges and/or mechanical joint bells drilled and tapped for studs where flush with the wall.

D. Castings provided with a 2-in minimum circumferential flange/waterstop integrally cast with or welded on both sides to the casting.

E. Located as follows:

1. For castings set flush with walls: located at the center of the overall length of the casting,
2. For castings which extend through wall: located within the middle third of the wall.

© 2026 CDM Smith
All Rights Reserved

2.4 SEALING MATERIALS

A. Mechanical seals:

1. Of rubber links shaped to continuously fill the annular space between the pipe and the wall opening or sleeve.
2. Link pressure plates molded of glass reinforced nylon:

    a. Colored throughout elastomer.
    b. Permanent identification of the size and manufacturer's name molded into the pressure plate and sealing element.

3. Hardware:

    a. Mild steel with a 60,000 psi minimum tensile strength.
    b. 2-part Zinc Dichromate coating per ASTM B-633.
    c. Organic Coating, tested in accordance with ASTM B-117 to pass a 1,500-hour salt spray test.
    d. Use Type 316 Stainless Steel hardware:

        1) In chemical areas.
        2) For submerged service.
        3) For penetrations in tanks containing sludge or wastewater.

4. Completed sealing system:

    a. Duty pressure rated for 20 psig differential pressure.
    b. EPDM for all services except fire rated assemblies

        1) Fire rated seals use silicone link material.

    c. Manufacturers:

        1) PSI-Thunderline/ Link-Seal as manufactured by Pipeline Seal & Insulator, Inc., Houston, TX, or pre-approved equal.
        2) Advance Products & Systems, Inc.
        3) Fernco Inc.
        4) Flexicraft Industries.
        5) GPT; an EnPro Industries company.

B. Sealant:

1. A two-part foamed silicone elastomer manufactured by:

    a. Dow Corning Co., Product No. 3-6548 silicone R.T.V.
    b. 3M brand fire barrier products caulk C.P. 25 and 3M brand moldable putty MP+.
    c. Flame-Safe fire stop systems FS-900 by Rectorseal.

2. Sealant bead configuration, depth and width in accordance with manufacturer's recommendations.

© 2026 CDM Smith
All Rights Reserved

2.5 MISCELLANEOUS MATERIALS

A. Bonding Compound:

1. Sikadur Hi-Mod epoxy by Sika Corp.
2. Euco 452 by Euclid Chemical Corp.; Master Builders Company.
3. Or equal.

B. Non-shrink grout:

1. Masterflow 713 by Master Builders Co.
2. Euco NS by Euclid Chemical Co.
3. Five Star Grout by U.S. Grout Corp.
4. Or equal.

C. Escutcheon plates: Stainless steel as manufactured by Kohler, American Standard, or equal.

2.6 FLEXIBLE CONNECTIONS

A. Manufacturers:

1. For pressure pipe applications and applications with steel and copper piping:
2. Flexicraft Industries, Chicago, IL;
3. Hyspan Precision Products, Inc.;
4. Metraflex Company, Chicago, IL; Victaulic Company, Easton, PA or equal.
5. Flex-Weld, Inc.
6. For non-pressurized applications involving plastic, clay, asbestos cement, or cast iron applications: Fernco or equal.

B. Non-Pressurized Piping (Plastic, Clay, Asbestos Cement, Cast Iron utilized under 4.3 psig)

1. Flexible couplings: in accordance with ASTM D 5926, C1173 and CSA B602.
2. Couplings: rubberized PVC and be attached with the use of adjustable stainless steel clamps.

2.7 SERVICE CLAMPS

A. Manufacturers:

1. GE Oil & Gas (Dresser Industries)
2. Xylem (Smith-Blair)
3. Mueller. or equal.

B. Service clamps on ductile iron piping systems with outlets up to 2-inches as shown on the Drawings to have malleable or ductile iron bodies that extend at least 160 degrees around the circumference of the pipe and have EPDM gasket cemented to the saddle body. Bodies to be tapped for IPS. Clamps to have double straps.

© 2026 CDM Smith
All Rights Reserved

2.8 SLEEVE-TYPE COUPLINGS

A. Manufacturers:

1. GE Oil & Gas (Dresser).
2. Xylem (Smith-Blair).

B. Description: Provide products by one of the following or equal.

1. Description: To connect two plain end pipes.
2. Comply with AWWA C213, C219.
3. Working Pressure Rating: 200 psi.
4. Middle Ring: ASTM A-536, Grade 65-45-12, ductile iron.
5. Followers: ASTM A-536, Grade 65-45-12, ductile iron.
6. Gaskets:
    a. Material: Butyl rated for a maximum temperature of 250 deg F and compatible with service conditions.
    b. Comply with ASTM D2000.
7. Bolts: ASTM A307 galvanized steel.

C. Finishes:

1. Factory fusion bonded epoxy coated.

2.9 QUICK CONNECT COUPLINGS

A. Provide quick connect couplings on flushing connections or temporary water connections as shown on the Drawings. Quick connects to be of the cam and groove type consisting of male and female adapters conforming to A-A-59326 (MIL-C-27487) with hose shanks. Couplings to be constructed of aluminum, with EPDM seal material. Male adapter to connect to the pipe via. threaded connection and designed to receive a female coupler without threading, bolting and tools. Connection to remain tight and leakproof under pressure up to 100 psig.

2.10 CARTRIDGE FILTERS

A. Manufacturers:

1. Filter Housing Assembly:
    a. CT Series manufactured by CUNO 3M, Meriden, Connecticut.
    b. Or equal.
2. Filter Cartridges:
    a. Micro-Klean III manufactured by CUNO 3M, Meriden, Connecticut.
    b. Or equal.

B. Description

© 2026 CDM Smith
All Rights Reserved

1. Filter Housing Assembly:

    a. Cartridge filter housing, cover, internals and all wetted parts: Type 316 stainless steel.
    b. All interior and exterior surfaces chemically passivated after fabrication.
    c. Vessels: Screw-on head equipped with nitrile gasket seals.
    d. Inlet and outlet connections: NPT threaded adhering to ASME B1.20.1.
    e. With ¼-inch NPT Type 316 stainless steel vent plug for air removal. Vent plug equipped with fiber gaskets.
    f. Housings capable of operating up to 300 psig at 200 degrees F, at 5 gpm.

2. Filter Cartridge

    a. Rigid resin bonded construction consisting of acrylic fibers and phenolic resin.
    b. Rated at 150 microns with a specific pressure drop of 0.0031 psid/gpm-Cp or less.
    c. Cartridge length 9.75 inches in one element, not composed of stacked up elements of shorter length.
    d. Temperature rating: 180 degrees Fahrenheit.

2.11 INSULATION

A. As specified in Section 404213 “Process Piping Insulation”.

2.12 RESTRAINED FLANGE ADAPTER

A. Manufacturers:

1. GE Oil & Gas (Dresser), Style 128-W.
2. Xylem (Smith-Blair), Type 913.
3. Romac Industries 491.

B. Description:

1. To connect a plain end pipe to a pipe flange.
2. Max. Pressure Rating: 150 psi.
3. Complies with AWWA.
4. Body & Flange: Ductile iron.
5. Follower: Ductile iron coupling with AISI C1012 or ASME SA36.
6. Wedge Gasket: Buna N.
7. Bolts & Nuts: High strength, low alloy steel.
8. Harness Lugs: ASTM A36 Steel
9. Tie rods: Alloy steel or stainless steel per ASTM A193
10. Finish: Factory bonded epoxy coated.

2.13 DISMANTLING JOINT

A. Manufacturers:

1. GE Oil & Gas (Dresser), Style 131.

2. Xylem (Smith-Blair), Type. 975
3. Romac Industries, Model DJ400.

B. Description:

1. Double ended flanged adapter that allows for longitudinal adjustment between flanges and quick removal.
2. Max. Pressure Rating: 150 psi.
3. Complies with AWWA.
4. Body & Flange: Ductile iron A536 or A36 steel.
5. Follower: Ductile iron A536 or A36 steel coupling with AISI C1012.
6. Wedge Gasket: Buna N or S.
7. Bolts & Nuts: High strength, low alloy steel.
8. Tie-Rods: Required.
9. Finish: Factory bonded epoxy coated."

2.14 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assemblies.

B. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolthole configurations or design and verify that new pipe and flanges mate properly.

C. Verify that openings are ready to receive sleeves and firestopping.

D. Verify that pipe plain ends to receive sleeve-type couplings are smooth and round for 12 inches from pipe ends.

E. Verify that pipe outside diameter conforms to sleeve manufacturer's requirements.

3.2 PREPARATION

A. Cleaning: Thoroughly clean end connections before installation.

B. Close pipe and equipment openings with caps or plugs during installation.

© 2026 CDM Smith
All Rights Reserved

C. Surface Preparation: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. Coating: Finish piping appurtenances as specified in Section 099679 “Atmospheric Protection and Plant Service Areas Coatings” for service conditions.

B. Pipe Penetrations:

1. Flashing:

a. Provide flexible flashing and metal counterflashing where piping penetrates weatherproofed or waterproofed walls, floors, and roofs.
b. Flash floor drains with topping over finished areas with lead, 10 inches clear on sides, with minimum 36-by-36-inch sheet size.
c. Fasten flashing to drain clamp device.

2. Sleeves:

a. Exterior Watertight Entries: Seal with mechanical sleeve seals.
b. Set sleeves in position in forms and provide reinforcement around sleeves.
c. Size sleeves large enough to allow for movement due to expansion and contraction and provide for continuous insulation wrapping.
d. Extend sleeves through floors 1 inch above finished floor level and calk sleeves.
e. Where piping penetrates floor, ceiling, or wall, close off space between pipe and adjacent Work with stuffing or firestopping insulation and calk airtight.
f. Provide close-fitting metal collar or escutcheon covers at both sides of penetration.
g. Install stainless-steel escutcheons at finished surfaces.

C. Firestopping:

1. Materials: As specified in Section 078400 “Firestopping”.

D. Restrained Joints: As shown on drawings.

E. Air Release and Vacuum Breakers: Provide vacuum breakers as indicated on Drawings.

F. Backflow Preventers:

1. Install with nameplate and test cock accessible.
2. Install according to local code requirements.
3. Do not install in vertical position.

G. Insulation: As specified in Section 404213 “Process Piping Insulation”.

H. Disinfection: Disinfect potable water piping as specified in Section 331300 “Disinfecting of Water Utility Distribution”.

© 2026 CDM Smith
All Rights Reserved

3.4 FIELD QUALITY CONTROL

A. After installation, inspect for proper supports and interferences.

B. Repair damaged coatings with material equal to original coating.

3.5 CLEANING

A. Keep equipment interior clean as installation progresses.

SECTION 400507 - HANGERS AND SUPPORTS FOR PROCESS PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section 013500 “Submittal Procedures”: Requirements for submittals.

B. Seismic Design and restraint requirements, in accordance with the Structural Design criteria.

1.3 ACTION SUBMITTALS

A. Product Data: Submit manufacturer's catalog data including load capacity.

B. Shop Drawings: Submit scaled piping layouts for each system. Indicate flow stream, pipe size(s) material(s), schedule(s), lining(s), critical dimensions between pipes, equipment and building features. Indicate by schedule pipe hanger/support type and locations. Provide detail of each type of hangers, supports, anchors, and guides in coordination with the submitted piping layouts and existing building conditions.

1.4 DELEGATED DESIGN SUBMITTALS

A. Delegated-Design Submittal: For hangers and supports for piping; Section 014000 “Quality Requirements” for additional delegated design requirements.

1. Supports shown in the Contract Drawings shall be considered diagrammatic and representative, and are shown for general coordination only. Not all required supports are indicated. The Contractor is responsible for a complete pipe support system per the delegated design requirements presented herein.
2. Engage the services of an independent registered professional engineer licensed in the State of New York ordinarily engaged in the business of pipe support systems analysis and design, to analyze system piping and service conditions, and to develop a detailed support system design, specific to the piping material, pipe joints, valves, and piping appurtenances proposed for use.

    a. Support system engineering groups include the following:
        1) SAC Incorporated https://www.sacincorporated.com/contact-us/
        2) Fenny Engineering http://www.fennyengineering.com/contact/
        3) Piping Solutions and Energy Associates https://www.pseassoc.com/request-for-service/
        4) Newman Associates https://newmanassoc.com/

3. The support system design shall include:

    a. Criteria by piping system.
    b. Summary of Contractor-selected related components including joints, class, valves, appurtenances, etc., and commercial supports and especially including pipe materials.
    c. Dead weight and dynamic analysis, including system thermal effects and pressure thrusts. Computer-based software system equivalent to Bentley Systems AutoPIPE or SST Systems CAEPIPE.

        1) Present each system in an isometric graphic and show the resolved and resultant force and moment systems, as well as all recommended hangers, supports, anchors, restraints, and expansion/flexible joints.

    d. Submit support system design to the Engineer for review. The submittal needs to be stamped by a professional engineer registered in New York.

4. Coordinate support arrangements to eliminate interference with similar systems to be installed under HVAC, Plumbing, and Electrical, to account for structural expansion joints and to maintain access for both personnel and for the removal of equipment.

B. Manufacturers' Instructions: Submit special procedures and assembly of components.

C. Qualifications Statement: Submit qualifications for licensed professional.

1.5 DELIVERY, STORAGE AND HANDLING

A. All supports and hangers shall be crated, delivered and uncrated so as to protect against any damage.

B. All parts shall be properly protected so that no damage or deterioration shall occur during a prolonged delay from the time of shipment until installation is completed.

C. Finished metal surfaces not galvanized, that are not of stainless-steel construction, or that are not coated, shall be grease coated, to prevent rust and corrosion.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on-Site in original factory packaging, labeled with manufacturer's identification.

B. Protect products from weather and construction traffic, dirt, water, chemical, and damage by storing in original packaging.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 MATERIALS

A. Metallic Pipe Support:

1. Submerged, buried, or within outdoor structures (vaults, etc.): Type 316 stainless steel (SS).
2. Within chemical areas: Vinyl ester fiberglass reinforced plastic (FRP) for pipe size up to 2 inch, epoxy coated steel for 2-1/2 inches size and larger.
3. Other locations: steel with galvanizing where noted, or if not otherwise noted, coating as required in Division 09 Finished Painting.
4. Additional requirements (including dielectric insulation) in ACCESSORIES Article.

B. Non-Metallic Pipe Support:

1. Submerged, buried, or within vaults: Type 316 stainless steel or FRP.
2. Within chemical areas: vinyl ester FRP.
3. Other locations: steel with galvanizing where noted, or if not otherwise noted, coating as required in Division 09 Finished Painting; all with local stress protection shields.
4. Additional requirements (including stress protection shields) in ACCESSORIES Article.

C. Wherever stainless steel is noted, it shall be Type 316 unless noted otherwise.

2.2 INSULATION

A. See ACCESSORIES Article and Drawings.

B. Section 404213 “Process Piping Insulation” for process piping insulation requirements.

2.3 SUPPORT AND RESTRAINT SYSTEMS

A. Steel or Ductile Iron Piping:

1. Cast iron and ductile iron, steel, and stainless-steel piping shall be supported at a maximum support spacing of 10 feet with a minimum of one support per pipe section at the joints, unless the Contract Drawings dictate larger spacings in coordination with existing conditions and the pipe stress analysis node locations.
2. Support spacing for ductile iron, steel, and stainless-steel piping 2-inch and smaller diameter shall not exceed 5 feet.

B. Copper Piping:

1. Supports for copper pipe shall be copper plated or shall have a 1/16 inch plastic coating.
2. Support spacing for copper piping and tubing 2 inch and smaller diameter shall not exceed 5 feet and greater than 2 inch diameter shall not exceed 8 feet.
3. Where pipe supports come in contact with copper piping, provide protection from galvanic corrosion by: wrapping pipe with 1/16 inch thick neoprene sheet material and

galvanized protection shield; isolators similar to Cooper B-Line B3195CT; or copper-plated or PVC-coated hangers and supports.

C. Non-Metallic Piping:

1. All uninsulated non-metallic piping such as PVC, CPVC, HDPE, PVDF, etc., shall be protected from local stress concentrations at each support point. Protection shall be provided by non-metallic protection shields or other method as approved by the Engineer.

    a. Where pipes are bottom supported 180 degrees, arc shields shall be furnished. Where 360-degree arc support is required, such as U-bolts, protection shields shall be provided for the entire pipe circumference. All U-bolts or clamps for non-metallic pipes shall be plastic coated.
    b. Protection shields shall have an 18-gauge minimum thickness, not be less than 12 inches in length and be securely fastened to pipe with Type 316 stainless steel straps not less than 1/2 inch wide.

2. Individually supported PVC pipes shall be supported as recommended by the pipe manufacturer except that support-spacing shall be manufacturers recommendation minus 2-ft. down to 5 ft spacing recommendation, then spacing shall be 3 feet.
3. Supports for horizontal multiple PVC plastic piping:

    a. Shall be continuous wherever possible.
    b. Multiple, suspended, horizontal plastic PVC pipe runs, where possible, shall be supported by ladder type cable trays such as: Husky Ladder Flange Out by MPHusky; or equal.
    c. Rung spacing shall be 12 inches. Tray width shall be approximately 6 inch for single runs and 12 inches for double runs.
    d. Ladder type cable trays shall be furnished complete with all hanger rods, rod couplings, concrete inserts, hanger clips, etc., required for a complete support system. Individual plastic pipes shall be secured to the rungs of the cable tray by strap clamps or fasteners similar to: Globe, Series 600; Unistrut Pipe/Conduit Clamps and Hangers; or equal.
    e. Spacing between clamps shall not exceed 9 feet. The cable trays shall provide continuous support along the length of the pipe. Individual clamps, hangers, and supports in contact with plastic PVC pipe shall provide firm support but not so firm as to prevent longitudinal movement due to thermal expansion and contraction.

D. Framing Support System:

1. See Part 2 MATERIALS for materials of construction.
2. Beams: Size such that beam stress does not exceed 25,000 psi and maximum deflection does not exceed 1/240 of span.
3. Column Members: Size in accordance with manufacturer's recommended method.
4. Support Loads: Calculate using weight of pipes filled with water.
5. Maximum Spans:

    a. Steel and ductile iron pipe 3 inch diameter and larger: 10 feet centers, unless the Contract Drawings dictate larger spacings in coordination with existing conditions and the pipe stress analysis node locations.

b. Other pipelines and special situations: Same as noted in previous paragraphs. Supplementary hangers and supports may be required.

E. All vertical pipes shall be supported at each floor or at intervals of not more than 12 feet by approved pipe collars, clamps, brackets, or wall rests and at all points necessary to ensure rigid construction. All vertical pipes passing through pipe sleeves shall be secured using a pipe collar.

2.4 ANCHOR BOLTS/SYSTEMS

A. Anchoring Devices: Design, size, and space support anchoring devices, including anchor bolts, inserts, and other devices used to anchor support, to withstand shear, and pullout loads imposed by loading and spacing on each particular support. DO NOT USE ADHESIVE ANCHOR BOLTS ON ANY PIPE SUPPORT HUNG FROM A ROOF OR CEILING, unless specifically noted otherwise.

B. All post-installed anchors in concrete shall have current published ICC-ES Evaluation Report indicating the anchor is approved for installation in cracked concrete.

C. The latest edition of the following specification and recommended practices shall become part of this specification as if written herein. Wherever requirements conflict, the more stringent shall govern.

1. ACI 318, Appendix D.
2. ACI 355.2, Mechanical Anchors “Qualification of Post-Installed Mechanical Anchors in Concrete”
3. Anchor manufacturer’s published installation requirements.

D. Expansion Anchors:

1. The length of expansion bolts shall be sufficient to place the wedge portion of the bolt a minimum of 1 inch behind the steel reinforcement.
2. Manufacturers:

a. Power-Stud+ SD4 and Power-Stud+ SD6 by Powers Fasteners, Brewster, NY.
b. Kwik Bolt as manufactured by Hilti USA, Tulsa, Oklahoma.
c. Wej-it by Wej-it Expansion Products, Inc., Broomfield, Colorado.

E. Unless otherwise noted: use Type 304 stainless steel anchoring parts/bolts and hardware for non-submerged supports, Type 316 stainless steel for submerged anchors.

F. Size of anchor bolts as designed by manufacturer, 1/2 inch minimum diameter, or as shown on the Drawings.

G. Anchors to concrete in chemical areas shall be epoxy secured vinyl ester FRP all thread, insertion depth and size as required by the manufacturer for the design loads. Nuts, bolts and hardware shall all be vinyl ester FRP construction.

© 2026 CDM Smith
All Rights Reserved

2.5 HANGER RODS

A. Where use of steel is allowed, hanger rods shall be hot-rolled steel, machine-threaded, and, except for stainless steel, galvanized after fabrication. The strength of the rod shall be based on its root diameter.

1. Hanger rods shall be attached to concrete structures using single or continuous concrete inserts by the named support manufacturers above. Where use of steel is allowed, inserts shall be malleable iron or steel with galvanized finish.
2. Beam-clamps, C-clamps, or welded-beam attachments shall be used for attaching hanger rods to structural steel members.

B. Minimum rod size for metallic rod hangers: (* For pipe diameters less than 14 inch, if using pipe roller, use 2 hanger rods with minimum diameter noted below for pipe's diameter).

	Nominal Pipe / Tube Diameter	Minimum Hanger Rod Diameter
1	Less than 2-1/2 inch	1/4 inch*
2	3 to 8 inches	1/2 inch
3	10 to 14 inches	3/4 inch*
4	16 to 20 inches	2 at 1 inch
5	24 inches	2 at 1-1/4 inch
6	30 inches	2 at 1-1/2 inch

2.6 SINGLE PIPE HANGERS

A. Unless otherwise indicated, pipe hangers and supports shall be standard catalogued components, conforming to the requirements of MSS-41, 58, or 69 and shall be of the following type:

1. Anvil International.
2. Equal models by: Carpenter & Patterson, Inc., Wobum, MA.
3. Cooper B-Line.
4. Gulf State Manufacturing.
5. Unistrut Northeast, Cambridge, Massachusetts.
6. CADDY; nVent.
7. Carpenter & Paterson, Inc.
8. Empire Industries, Inc.
9. Globe Pipe Hanger Products Incorporated.
10. Haydon Corporation.
11. Hilti, Inc.
12. NIBCO INC.
13. PHD Manufacturing, Inc.
14. PHS Industries, Inc.
15. Unitron Product, Inc. / US-Strut.

B. Single pipes shall be supported by hangers suspended by hanger rods from structural steel members, concrete ceilings, bottom of trapeze hangers, and wall-mounted steel angle brackets.

C. Where pipes are near walls, beams, columns, etc., and located an excessive distance from ceilings or underside of beams, welded steel wall brackets similar to Carpenter and Patterson, Figure Nos. 68, 79, 84, or 139 shall be used for hanging pipe. Where single pipes rest on top of bracket pipe supports, attachments shall meet requirements as specified under multiple pipe hangers.

2.7 MULTIPLE PIPE HANGERS

A. Suspended multiple pipes, running parallel in the same horizontal plane that are adjacent to each other, shall be suspended by trapeze type hangers or wall brackets. Where use of steel is allowed, trapeze hangers shall consist of galvanized structural steel channel supported from galvanized threaded rod or attached to concrete walls, columns, or structural steel support members. See previous paragraphs about multiple PVC pipe supports.

B. Except as otherwise specified herein, pipe anchors used for attaching pipe to trapeze or multiple pipe wall brackets shall be anchor or pipe chairs similar to:

1. Anvil Fig. 175.
2. Cooper B-Line B3147A or B3147B.
3. Where use of steel is allowed, material of construction shall be galvanized steel. Chair U bolts shall be tightened to allow freedom of movement for normal expansion and contraction except where pipe must be anchored to control direction of movement or act as a thrust anchor.

2.8 SINGLE PIPE SUPPORTS FROM BELOW

A. Single pipes located in a horizontal plane close to the floor shall be Pedestal type: Schedule 40 pipe stanchion, saddle, and anchoring flange.

1. Nonadjustable Saddle: MSS SP 58, Type 37 with U-Bolt.

   a. Anvil, Figure 259.
   b. Cooper B-Line, Figure B3090.

2. Adjustable Saddle: MSS SP 58, Type 38 without clamp.

   a. Anvil, Figure 264.
   b. Cooper B-Line, Figure B3093.

B. Pipes less than 3 inch in diameter:

1. Hold in position by supports fabricated from steel C channel, welded post base similar to Unistrut, Figure P2072A, where use of steel is allowed; and pipe clamps similar to Unistrut, Figures P1109 through 26.

2. Where required to assure adequate support, fabricate supports using two vertical members and post bases connected by horizontal member of sufficient load capacity to support pipe.
3. Fasten supports to nearby walls or other structural member to provide horizontal rigidity.
4. More than one pipe may be supported from a common fabricated support.

C. Pipes 3 inch in diameter and larger:

1. Support by adjustable stanchions.
2. Provide at least 4 inch adjustment.
3. Flange mount to floor.

D. Use yoked saddles for piping whose centerline elevation is 18 inch or greater above the floor and for all exterior installations.

E. Pipe roller type supports shall be used where required to accommodate thermal movement in conjunction with axial supports.

2.9 WALL SUPPORTED SINGLE AND MULTIPLE PIPES

A. Single or multiple pipes located adjacent to walls, columns, or other structural members shall be supported using welded steel wall brackets, where use of steel is allowed, as manufactured by Carpenter and Patterson, Figure No. 69, 84, or 139.

B. Where noted, multiple pipes may be supported on C-channel with steel brackets similar to Unistrut pipe clamps; with pipe anchor chairs; or equal.

C. Individual pipes, up to 8-in diameter, where noted, may use MSS Type 8 pipe clamps as noted on the Drawings.

D. Securely fasten all members to wall, column, etc., using double-expansion shields or other method as approved by the Engineer. Provide additional wall bearing plates as required.

2.10 BASE ANCHOR SUPPORT

A. Bend Support: Where pipes change direction from horizontal to vertical via a bend, install a welded or cast base bend support to carry the load. Fasten to the floor, pipe stanchion, or concrete pedestal using expansion anchors or other method as approved by the Engineer.

B. Concrete Supports: Where indicated, securely fasten pipe bends to concrete supports with suitable metal bands as required and approved by the Engineer. Isolate piping from poured concrete with a neoprene insert.

2.11 VERTICAL PIPE SUPPORTS

A. Where vertical pipes are not supported by a Unistrut type system as specified, they shall be supported in one of the following methods.

1. For pipes 1/4 to 2 inch in diameter:

a. Provide extension hanger ring with an extension rod and hanger flange.
b. The rod diameter shall be as recommended by the manufacturer for the type of pipe to be supported.
c. Where use of steel is allowed, the hanger ring shall be steel- or PVC-clad depending on the supported pipe material of construction. The hanger ring shall be equal to Carpenter & Patterson, Figure Nos. 81.
d. Where use of steel is allowed, the anchor flange shall be galvanized malleable iron similar to Carpenter and Patterson, Figure No. 85.

2. For pipes equal to or greater than 2 inches in diameter:

a. Extended pipe clamps similar to Carpenter & Patterson, Figure No. 267 may be used.
b. Attach hanger to concrete structures using double expansion shields,
c. Attach hanger to metal support members using welding lugs similar to Carpenter & Patterson, Figure No. 114.

B. Pipe supports shall be provided for closely spaced vertical piping systems required to provide a rigid installation. The interval of vertical support spacing shall be as specified, but in no case shall vertical interval exceed 12 feet. The support system shall consist of a framework suitably anchored to floors, ceilings, or roofs.

C. Unless otherwise specified, shown, or specifically approved by the Engineer, vertical runs exceeding 12 feet shall be supported by base elbows/tees, clamps, brackets, wall rests, and pipe collars, all located as required to ensure a rigid installation.

D. Pipe riser clamps, per MSS SP58, shall be used to support all vertical pipes extending through floor slabs. Where use of steel is allowed, riser clamps shall be galvanized steel manufactured by:

1. Carpenter & Patterson, Figure No. 128.
2. Anvil, Figure 261.
3. Cooper B-Line, Figure B3373.
4. Or equal.

E. Copper-clad or PVC-coated clamps shall be used on copper pipes. Insulation shall be removed from insulated pipes prior to installing riser clamps. Insulation shall not be damaged by clamp installation.

2.12 SPECIAL SUPPORTS

A. Frame Work Supports:

1. Vertical and horizontal supporting members shall be U-shaped channels similar to Unistrut, Series P1000. Vertical piping shall be secured to the horizontal members by pipe clamps or pipe straps. See pipe clamp and strap requirements.
2. For piping 3 inch and smaller, framework shall be as manufactured by:

a. Unistrut Corporation.
b. Power-Strut (or Ackinstrut where fiberglass systems are specified).

c. Multi-Strut by Carpenter-Paterson.
d. Or equal.

3. For piping larger than 3 inch, the support frame shall be fabricated from structural stainless steel or steel shapes, depending upon the support location, and secured through the use of drop in, adhesive or expansion anchors.
4. The assemblies shall be furnished complete with all nuts, bolts, and fittings required for a complete assembly including end caps for all Unistrut members.
5. Electrical Conduit Support: Under Division 26.
6. The design of each individual framing system shall be the responsibility of the Contractor. Submit shop drawings, and show all details of the installation, including dimensions and types of supports. In all instances the completed frame shall be adequately braced to provide a complete rigid structure when all the piping has been attached. See also Article SUPPORT AND RESTRAINT.

B. Supports not otherwise described in this Section shall be fabricated or constructed from standard structural stainless steel or steel shapes in accordance with applicable provisions of Section 055000 “Metal Fabrications,” or Unistrut-type frame; have anchor hardware similar to items previously specified herein; shall meet the minimum requirements listed below; and be subject to the approval of the Engineer.

C. Additional Pipe Support Situations:

1. Supporting Multiple Chemical and Related Piping:

a. Location: indicated on Drawings or otherwise required, especially adjacent to chemical pumps.
b. Use: framework support.
c. Materials: FRP, with proper local stress protection.

2.13 SHOP FACTORY FINISHING

A. Prepare and prime metallic (except stainless steel) supports in accordance with Division 09.

2.14 ACCESSORIES

A. Insulation Shield: Install on insulated non-steel piping. Oversize the rollers and supports, as required. Manufacturers:

1. Anvil, Figure 167.
2. Cooper B-Line, Series B3151.

B. Welding Insulation Saddle: Install on insulated metal pipe. Oversize the rollers and supports, as required. Manufacturers:

1. Anvil, Figure 160.
2. Cooper B-Line, Series B3160.

C. Vibration Isolation Pad: Install under base flange of pedestal type pipe supports adjacent to equipment, and where required to isolate vibration.

1. Isolation pads to be neoprene, waffle type.
2. Manufacturers:

a. Mason Industries, Type W.
b. Korfund.

D. Dielectric Barrier:

1. Install between carbon steel members and copper or stainless-steel pipe.
2. Install between stainless steel supports and non-stainless steel ferrous metal piping.
3. All stainless-steel piping shall be isolated from all ferrous materials, including galvanized steel by use of neoprene sheet material and protection shields.

E. Electrical Isolation: Install 1/4 by 3 inch neoprene rubber wrap between submerged metal pipe and oversized clamps.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify field dimensions as indicated on Shop Drawings.

3.2 INSTALLATION

A. Obtain permission from Engineer before using powder-actuated anchors.

B. Obtain permission from Engineer before drilling or cutting structural members.

C. Inserts:

1. Install inserts for placement in concrete forms. Before setting inserts, all drawings and figures shall be checked that have a direct bearing on the pipe location. Responsibility for the proper location of pipe supports is included under this Section.
2. Install inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
3. Provide hooked rod to concrete reinforcement section for inserts carrying pipe 4 in and larger.
4. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.
5. Where inserts are omitted, drill through concrete slab from below and provide through-bolt with recessed square steel plate and nut recessed into and grouted flush with slab. ENGINEER shall be consulted prior to any approval for through bolt systems.
6. Existing slab reinforcing shall be field verified by GPR scan or similar prior to any drilling for through bolts. Under no circumstance shall existing reinforcing be drilled through. Hole locations shall be coordinated accordingly with the overall pipe support layout and design.

D. Pipe Hangers and Supports:

1. Install according to: ASME B31.3 and MSS SP 58.
2. Support horizontal piping as indicated on Shop Drawings, depending upon pipe size.
3. Install hangers with minimum 1/2 in space between finished covering and adjacent Work.
4. Place hangers within 12 in of each horizontal elbow.
5. Use hangers with 1-1/2 in minimum vertical adjustment.
6. Support horizontal cast iron pipe adjacent to each hub, with 5 ft maximum spacing between hangers.
7. Support vertical piping at every floor. Support vertical cast iron pipe at each floor at hub.
8. Where piping is installed in parallel and at same elevation, provide multiple pipe or trapeze hangers.
9. Support riser piping independently of connected horizontal piping.
10. Provide copper-plated hangers and supports for copper piping.
11. Design hangers for pipe movement without disengagement of supported pipe.
12. Support piping independently so that equipment is not stressed by piping weight or expansion in piping system.
13. Support large or heavy valves, fittings, and appurtenances independently of connected piping.
14. Provide welded steel brackets where piping is to be run adjacent to building walls or columns.
15. Use beam clamps where piping is to be suspended from building steel.
16. Insulated Piping: Provide two bolted clamps designed to accommodate insulated piping.
17. Use offset clamps where pipes are indicated as offset from wall surfaces.
18. Proceed with installation of piping and supports only after any building structural work has been completed and new concrete has reached its 28-day compressive strength.
19. The installation of pipe support systems shall not interfere with the operation of any overhead bridge cranes, monorails, access hatches, etc. No piping shall be supported from stairs, other pipes, ladders, and walkways unless authorized by the Engineer.
20. Repair mounting surfaces to original condition after attachments are made.
21. Brace horizontal pipe movements by both longitudinal and lateral sway bracing.
22. Where supports are required in areas to receive chemical resistant seamless flooring, install supports prior to application of flooring system.

E. Insulation:

1. Provide clearance in hangers and from structure and other equipment for installation of insulation.
2. Conform to Section 404213 “Process Piping Insulation”.

F. Equipment Bases and Supports:

1. Provide housekeeping pads as detailed on Drawings.
2. Using templates furnished with equipment, install anchor bolts and accessories for mounting and anchoring equipment.
3. Construct supports of steel members. Brace and fasten with flanges bolted to structure.
4. Provide rigid anchors for pipes after vibration isolation components are installed. Comply with Section 400513 - Common Work Results for Process Piping.

G. Prime Coat:

1. Prime coat exposed steel hangers and supports.
2. 099679 **"**Atmospheric Protection and Plant Sevice Areas Coatings"**.**
3. Hangers and supports located in crawl spaces, pipe shafts, and suspended ceiling spaces are not considered exposed.

3.3 FIELD QUALITY CONTROL

A. All pipe support systems shall be tested after installation in conjunction with the respective piping pressure tests. If any part of the pipe support system proves to be defective or inadequate, it shall be repaired, augmented or replaced to the satisfaction of the Engineer.

B. After the work is installed, but before it is filled for start-up and testing, the Support System Design Engineer shall inspect the work and shall certify its complete adequacy. Each system shall be inspected and certified in the same way.

C. Submit a report, including all field modifications and including all certificates.

1. Insert state where project is located.
2. The report shall bear the stamp of a professional engineer registered in State where work installed and shall be subject to the review of the Engineer.

3.4 ATTACHMENT SCHEDULE

A. Pipe Hanger Spacing:

1. Pipe Material: ABS.

    a. Maximum Hanger Spacing: 4 feet
    b. Hanger Rod Diameter: 3/8 inch

2. Pipe Material: Aluminum.

    a. Maximum Hanger Spacing: 10 feet
    b. Hanger Rod Diameter: 1/2 inch

3. Pipe Material: Cast iron.

    a. Maximum Hanger Spacing: 5 feet
    b. Hanger Rod Diameter: 5/8 inch

4. Pipe Material: Cast Iron, with 10-foot length of pipe.

    a. Maximum Hanger Spacing: 10 feet
    b. Hanger Rod Diameter: 5/8 inch

5. Pipe Material: CPVC.

    a. Size: 1 inch and smaller.
    b. Maximum Hanger Spacing: 3 feet
    c. Hanger Rod Diameter: 1/2 inch

6. Pipe Material: CPVC.

    a. Size: 1-1/4 inches and larger.
    b. Maximum Hanger Spacing: 4 feet
    c. Hanger Rod Diameter: 1/2 inch

7. Pipe Material: Copper tube.

    a. Size: 1-1/4 inches and smaller.
    b. Maximum Hanger Spacing: 6 feet
    c. Hanger Rod Diameter: 1/2 inch

8. Pipe Material: Copper tube.

    a. Size: 1-1/2 inches and larger.
    b. Maximum Hanger Spacing: 10 feet
    c. Hanger Rod Diameter: 1/2 inch

9. Pipe Material: Fiberglass:

    a. Maximum Hanger Spacing: 4 feet
    b. Hanger Rod Diameter: 1/2 inch

10. Pipe Material: Glass.

    a. Maximum Hanger Spacing: 8 feet
    b. Hanger Rod Diameter: 1/2 inch

11. Pipe Material: Polybutylene.

    a. Maximum Hanger Spacing: 2.7 feet
    b. Hanger Rod Diameter: 3/8 inch

12. Pipe Material: Polypropylene.

    a. Maximum Hanger Spacing: 4 feet
    b. Hanger Rod Diameter: 3/8 inch

13. Pipe Material: PVC.

    a. Maximum Hanger Spacing: 4 feet
    b. Hanger Rod Diameter: 3/8 inch

14. Pipe Material: Steel.

    a. Size: 3 inches and smaller.
    b. Maximum Hanger Spacing: 12 feet
    c. Hanger Rod Diameter: 1/2 inch

15. Pipe Material: Steel.

    a. Size: 4 inches and larger.

SECTION 400517 - COPPER PROCESS PIPE AND TUBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Copper pipe and fittings.
2. Copper tube and fittings.
3. Accessories.

B. Related Requirements:

1. Section 400506 “Couplings, Adapters, and Specials for Process Piping” for piping appurtenances.
2. Section 400507 “Hangers and Supports for Process Piping” for hangers, anchors, sleeves, and sealing of piping to adjacent structures.
3. Section 400551 “Common Requirements for Process Valves” for common product requirements for valves for placement by this Section.

1.3 DEFINITIONS

A. Pipe: Hollow, cylindrical metal product that is normally used to transport gases or fluids, includes iron pipe size (I.P.S.) and schedule number in its classification, and is measured by the nominal outside diameter (NPS) and wall thickness; regardless of the wall thickness, the nominal OD of same size pipe does not change.

B. Piping: A system of pipes and fittings.

C. Tube: Hollow, cylindrical metal product that is normally used for structural purposes having an outside diameter that is not standardized for threading and is dimensionally measured on the exact outside diameter and wall thickness, often specified as a gauge.

D. Tubing: A system of tubes and fittings.

E. Soldering: Joining of metals through the use of heat and capillary flow of a filler metal having a melting temperature below 840 degrees F, and which creates a weaker bond than a brazed joint.

F. Brazing: Joining of metals through the use of heat and capillary flow of a filler metal having a melting temperature above 840 degrees F, but below the melting point of the metals being joined.

G. Flux: Material used in soldering and brazing to clean the metal surfaces and to make it easier for solder to flow over the pieces being joined.

H. DHP, Deoxidized High-residual Phosphorus Copper: Copper deoxidized with phosphorus residual in amounts 0.015 to 0.040%. The copper is not susceptible to hydrogen embrittlement. The copper is relatively low-electrical conductivity due to the amount of phosphorus present.

1.4 ACTION SUBMITTALS

A. Product Data: Submit manufacturer information regarding pipe, tube, and fittings.

B. Shop Drawings: Indicate layout of piping systems, including equipment, critical dimensions, sizes, and materials list.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

1.5 INFORMATIONAL SUBMITTALS

A. Source Quality-Control Submittals: Indicate results of shop and factory tests and inspections.

B. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

1. Except as provided under NFPA 99, brazing procedures and brazer performance to be qualified per Section IX, Welding and Brazing Qualifications of the ASME Boiler and Pressure Vessel Code, or AWS B2.2 both as modified below.
2. Brazers: Qualified by visual examination of test coupon followed by:

    a. Sectioning (per ASME Section IX)
    b. Macroetching (per AWS B2.2)

3. Brazing Procedure Specification: Use by Contractor during installation work to address cleaning, joint clearance, overlap, internal purge gas, purge gas flow rate, and filler material.

C. Qualifications Statements:

1. Submit qualifications for manufacturer, installer, and licensed professional.
2. Submit manufacturer's approval of installer.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping, valves and other appurtenances, connections, and centerline elevations.

B. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

© 2026 CDM Smith
All Rights Reserved

1.7 QUALITY ASSURANCE

A. Permanently mark each length of pipe with manufacturer's name or trademark and indicate conformance to standards.

B. Materials in Contact with Potable Water: Certified according to NSF 61 and NSF 372.

C. Perform Work according to State of New York Department of Transportation standards.

D. Maintain a copy of each standard affecting Work of this Section on Site.

1.8 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience.

B. Installer: Company specializing in performing Work of this Section with minimum three years' experience.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage. Photograph and provide written documentation of damaged material.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location.
2. Protect piping and appurtenances by storing off ground.
3. Provide additional protection according to manufacturer instructions.

1.10 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

PART 2 - PRODUCTS

2.1 PIPE MATERIALS

A. Pipe: Seamless copper, ASTM B306, DWV, Type K - heavy wall.

© 2026 CDM Smith
All Rights Reserved

2.2 TUBE MATERIALS

A. Tube: Seamless copper, ASTM B88, Type K, heavy wall.

2.3 FITTING MATERIALS

A. Cast bronze, threaded adaptors, 150 lb, screwed, ASTM B62, ANSI/ASME B16.15.

B. Brass tube solder type, ASTM B62, ASME B16.18.

C. Wrought copper, solder type, ASTM B75, ASME B16.22.

D. Cast brass or bronze recessed drainage pattern, ASME B16.23.

E. Soldered cast brass or wrought copper drainage pattern, ASME B16.29.

F. Bronze unions with ground joint seats, 125 lb, ASTM B62.

G. Brazed type, MSS SP-73.

2.4 CONNECTION MATERIALS

A. Solder: ASTM B32, alloy TC (95 percent Tin, 4.85 percent Copper 0.15 percent Selenium), lead free, certified to comply with ANSI/NSF 61.

B. Brazing: AWS A5.8/A5.8M, brazing filler metal classified as BCu4 or BCu5, with minimum melting point of 1300 degrees F. Use wrought fittings for brazing.

C. Do not use connection materials containing lead of any percentage.

2.5 ACCESSORIES

A. Bolting: Comply with ASTM B98/B98M.

B. Solder: Comply with ASTM B32.

C. Piping Supports:

1. Material: Copper.
2. As specified in Section 400507 “Hangers and Supports for Process Piping.”
3. Comply with MSS SP-58.

2.6 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

B. Owner Inspection:

1. Make completed piping and tubing components available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design and verify that new pipe and flange mate properly.

3.2 PREPARATION

A. Thoroughly clean pipe and fittings before installation.

3.3 INSTALLATION

A. Comply with ASME B31.3.

B. Run piping straight along alignment as indicated on Shop Drawings, with minimum number of joints.

C. Fittings:

1. Clean gasket seats thoroughly, and wipe gaskets clean prior to installation.
2. Install fittings according to manufacturer instructions.
3. Bolts:

a. Tighten progressively, drawing up bolts on opposite sides until bolts are uniformly tight.
b. Use torque wrench to tighten bolts to manufacturer instructions.

D. Provide required upstream and downstream clearances from devices as indicated on Shop Drawings.

E. Install piping with sufficient slopes for venting or draining liquids and condensate to low points.

F. Support exposed piping as specified in Section 400507 “Hangers and Supports for Process Piping”.

G. Provide expansion joints as specified in Section 400506 “Couplings, Adapters, and Specials for Process Piping”, and pipe guides as specified in Section 400507 “Hangers and Supports for Process Piping”, to compensate for pipe expansion due to temperature differences.

H. Dielectric Fittings: Provide between dissimilar metals.

I. Field Cuts: According to pipe manufacturer instructions.

3.4 TOLERANCES

A. Laying Tolerance: 5/8 inch.

3.5 FIELD QUALITY CONTROL

A. Inspection: Inspect for damage to pipe lining or coating and for other defects that may be detrimental as determined by Engineer.

1. Repair damaged piping or provide new, undamaged pipe.
2. After installation, inspect for proper supports and interferences.

B. Pressure Testing:

1. Test Pressure: Not less than 150 psig or 50 psi in excess of maximum static pressure, whichever is greater.
2. Conduct hydrostatic test for minimum two hours.
3. Filling:

    a. Fill section to be tested with water slowly and expel air from piping at high points.
    b. Install corporation cocks at high points.
    c. Close air vents and corporation cocks after air is expelled.
    d. Raise pressure to specified test pressure.

4. Observe joints, fittings, and valves under test.
5. Remove and renew cracked pipe, joints, fittings, and valves showing visible leakage and retest.
6. Leakage:

    a. Correct visible deficiencies and continue testing at same test pressure for additional two hours to determine if any leakage is present.
    b. Maintain pressure within plus or minus 5 psi of test pressure.
    c. If test of pipe indicates leakage, locate source of leakage, make corrections, and retest until leakage is eliminated.

© 2026 CDM Smith
All Rights Reserved

3.6 CLEANING

A. Keep pipe interior clean as installation progresses.

B. After installation, clean pipe interior of soil, grit, and other debris.

SECTION 400519 - DUCTILE IRON PROCESS PIPE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Ductile-iron pipe.
2. Ductile-iron, malleable-iron, and cast-iron fittings.
3. Accessories.
4. Delegated design.

B. Related Requirements:

1. Section 400506 “Couplings, Adapters, and Specials for Process Piping” for piping appurtenances.
2. Section 400507 “Hangers and Supports for Process Piping” for hangers, anchors, sleeves, and sealing of piping to adjacent structures.
3. Section 400551 “Common Requirements for Process Valves” for common product requirements for valves for placement by this Section.
4. Section 404642 “Cathodic Process Corrosion Protection” for passive cathodic protection for buried ferrous piping.

1.3 COORDINATION

A. Coordinate Work of this Section with piping and equipment connections specified in other Sections and indicated on Drawings.

1.4 ACTION SUBMITTALS

A. Product Data: Submit manufacturer information regarding pipe and fittings.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings:

1. Indicate layout of piping systems, including equipment, critical dimensions, sizes, and materials lists.
2. Include plans, elevations, sections, and attachment details.
3. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
4. Detail fabrication and assembly of.
5. Include diagrams for power, signal, and control wiring.

C. Product Schedule: Use same designations indicated on Drawings.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Influent Pump Station: Pumps, Valves, and Flowmeters.
2. Influent Pump Station; Buried and Exposed Pipe, and Connections to Existing Pipe.
3. Influent Pump Station connection to the wet well.

B. Manufacturer's Certificate: Prior to shipment of pipe, submit a certified affidavit of compliance from the pipe manufacturer stating that the pipe fittings, gaskets, linings and exterior coating for this project have been manufactured and tested in accordance with AWWA and ASTM standards and requirements specified herein.

C. Source Quality-Control Submittals: Indicate results of shop tests and inspections.

D. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

E. Qualifications Statements:

1. Submit qualifications for manufacturer, installer, and licensed professional.
2. Submit manufacturer's approval of installer.

F. American Iron and Steel (AIS): Submit certification indicating compliance with AIS requirements.

G. Welding certificates.

H. Certified Affidavit of Compliance: Prior to shipment of pipe. State that the pipe, fittings, gaskets, linings and exterior coatings for this project have been manufactured and tested in accordance AWWA and ASTM standards and requirements specified herein.

I. Product Test Reports: As required by the standard specifications to which the material is manufactured. Furnish in duplicate to the Engineer sworn certificates of such tests and their results prior to the shipment of the pipe.

J. Source quality-control reports.

K. Field quality-control reports.

L. Sample Warranty: For manufacturer's warranty.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping, valves and other appurtenances, connections, and centerline elevations.

B. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.8 QUALITY ASSURANCE

A. Materials (including linings) in Contact with Potable Water: Certified according to NSF 61 and NSF 372.

B. Hydrostatically test each length of ductile iron pipe at the point of manufacture to 500 psi for a duration of 10 seconds per AWWA C151. Furnish certified test results in duplicate to the Engineer prior to time of shipment.

C. Inspect and test by Manufacturer the ductile-iron pipe and fittings at the foundry as required by the AWWA C600, Hydrostatic Testing. Furnish in duplicate to the Engineer sworn certificates of such tests and their results prior to the shipment of the pipe.

D. Pipe and fittings to be installed under this Contract may be inspected at the plant for compliance with this Section by an independent testing laboratory selected by the Owner, at the Owner's expense.

E. Engineer will inspect the pipe and fittings after delivery. Products are subject to rejection at any time on account of failure to meet any of the specified requirements, even though accepted as satisfactory at the place of manufacture. Immediately mark pipe rejected after delivery and remove from the job site.

F. Permanently mark pipe and fittings with the following information:

1. Manufacturer name and trademark
2. Manufacturing date.
3. Size, type, class, or wall thickness.
4. Production Standard (AWWA, ASTM, etc.).

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' documented experience.

© 2026 CDM Smith
All Rights Reserved

1.10 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage. Photograph and provide written documentation of damaged materials.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Cover all openings to prevent entrance of dirt, water, and debris.
3. Protect piping and appurtenances by storing off ground
4. Limit stacking height to manufacturers specified maximum
5. Provide additional protection according to manufacturer instructions.

1.11 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

PART 2 - PRODUCTS

2.1 DUCTILE IRON PIPE AND FITTINGS

A. Piping:

1. Comply with AWWA C115, C150, and C151.
2. Thickness Class**:** As indicated on piping schedule.
3. Ductile Iron pipe as manufactured by U.S. Pipe and Foundry Company, Inc.; American Cast Iron Pipe Company; all divisions of the McWane Company or an approved equal who is a member of the Ductile Iron Pipe Research Association (DIPRA).

B. Fittings:

1. Material: AWWA C110, ductile iron.
2. Class: Same as that of connected piping.
3. Mechanical Joints:

a. Comply with AWWA C110 and AWWA C111.
b. Glands: Ductile iron with asphaltic coating.
c. Push-on Joints: Comply with AWWA C111.

4. Restrained Joints: Comply with AWWA C111.
5. Flanged Fittings: Comply with AWWA C110.

a. Assembly bolts: square headed carbon steel machine bolts with hexagon nuts per ANSI B18.2. Threads conform to ANSI B1.1. Bolt length: 1/8” to 5/8” protrusion from nut after torquing.
b. Steel flanges in conformance with AWWA C207, Class D, may be mated to iron valves, fittings, or other parts having either integral Class 125 iron flanges or screwed Class 125 companion flanges. When such construction is used, the raised face on mating flanges shall be removed.

6. Sleeve type couplings: Dresser Style 38 or 138 as manufactured by Dresser Industries, or equivalent products of Smith-Blair, Romac Industries, Ford Meter Box Co or approved equal.
7. Flanged coupling adaptors: Smith-Blair Type 913, or equivalent products of Klamflex Pipe Couplings (PTY) LTD, Robar Industries LTD or approved equal.

C. Cement-Mortar Lining:

1. Comply with AWWA C104.
2. Thickness: Double.
3. Wastewater Applications:

a. Lining material as defined on the Drawings.
b. ASTM C150 Type II cement mortar lining and asphaltic seal coat in accordance with AWWA C104.

D. Special Linings

1. Epoxy Lining:

a. Line ductile iron pipe and fittings with a ceramic-filled amine-cured epoxy, Protecto 401 by Induron.
b. Lining thickness of 40 mils minimum. Applicator approved by the coating manufacturer and applied in accordance with manufacturer's instructions and under controlled conditions at the applicator's shop or the pipe manufacturer's plant.
c. Submit a certified affidavit of compliance with manufacturer's instructions and requirements specified herein.

E. Exterior Coating:

1. Exposed Service: As specified in Section 099679 “Atmospheric Protection and Plant Service Areas Coatings”.
2. If required, coatings "hold-backs" to be provided at pipe and fitting ends for satisfactory installation for joint connections in the field.
3. Provide all necessary coating materials to perform field coating applications at joints compatible with or equal to the shop applied material.
4. Field repair of pipe with damaged coating receives prior approval of the Engineer. If, in the opinion of the Engineer coating damage is beyond repair, pipe to be replaced at the expense of the Contractor.
5. All flange bearing surfaces are uncoated.
6. Mechanically clean or brush blast all surfaces to have exterior coating applied to ductile iron surfaces. Chemical cleaning or wiping with solvent is not acceptable.

2.2 ACCESSORIES

A. Thermal Insulation:

1. As indicated on the pipe schedule**.**

B. Gaskets:

1. Full face type or ring type per AWWA C111 to provide positive sealing for the flanged ductile iron joints.
2. Thickness: 1/8-inch.
3. NSF61 certified for potable water applications.

2.3 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

B. Owner Inspection:

1. Make completed piping components available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design and verify that new pipe and flange mate properly.

3.2 PREPARATION

A. Thoroughly clean pipe and fittings before installation.

B. Surface Preparation: As specified in Section 099679 “Atmospheric Protection and Plant Service Areas Coatings”.

3.3 INSTALLATION

A. Buried Service Piping: As specified in Section 331116 - Site Water Utility Distribution Piping.

B. Exposed Service Piping:

1. According to ASME B31.3.
2. In compliance with manufacturer’s instructions.
3. Run piping straight along alignment as indicated on Shop Drawings, with minimum number of joints.
4. Clean each length prior to installation.
5. Support per Section 400507.
6. Do not use equipment flanges for support; support pipe separately.

C. Fittings:

1. According to manufacturer instructions.
2. Clean gasket seats thoroughly, and wipe gaskets clean prior to installation.
3. Tighten bolts progressively, drawing up bolts on opposite sides until bolts are uniformly tight; use torque wrench to tighten bolts to manufacturer instructions.
4. Flanged joints to be made using gaskets, bolts, bolt studs with a nut on each end, or studs with nuts where the flange is tapped. The number and size of bolts to conform to the same ANSI Standard as the flanges.
5. Provide required upstream and downstream clearances from devices as indicated on Drawings.

D. Make taps to ductile iron piping only with service saddle, tapping boss of a fitting or valve body, or equipment casting.

E. Install piping with sufficient slopes for venting or draining liquids and condensate to low points.

F. Support exposed piping as specified in Section 400507 - Hangers and Supports for Process Piping.

G. Provide expansion joints as specified in Section 400506 - Couplings, Adapters, and Specials for Process Piping, and pipe guides as specified in Section 400507 - Hangers and Supports for Process Piping, to compensate for pipe expansion due to temperature differences.

H. Disinfection: Disinfect potable water piping as specified in Section 331300 - Disinfecting of Water Utility Distribution.

I. Dielectric Fittings: Provide between dissimilar metals.

J. Insulated flanged joints:

1. Provide between dissimilar metals.

2. Flange insulation kits to include flange insulating gasket, flange bolt insulating sleeves, and bolt insulating washers.

K. Field Cuts: According to pipe manufacturer instructions. Cutting by abrasive saw only, leaving a smooth cut at right angles to the axis of the pipe. Damage to the lining repaired to the satisfaction of the Engineer. Seal Field cut ends approved epoxy coating in accordance with manufacturer's instructions.

L. Finish primed surfaces according to Section 099679 “Atmospheric Protection and Plant Service Areas Coatings.”

3.4 TOLERANCES

A. Deflection at joints not to exceed that recommended by the pipe manufacturer.

B. Supply and install fittings, in addition to those shown on Drawings, in areas where conflict exists with existing facilities.

3.5 FIELD QUALITY CONTROL

A. Inspection:

1. Inspect for damage to pipe lining or coating and for other defects that may be detrimental as determined by Engineer.
2. Repair damaged piping or provide new, undamaged pipe at no additional cost to the project.
3. After installation, inspect for proper supports and interferences.

B. Pressure Testing:

1. Test Pressure:

   a. As indicated on piping schedule.
   b. If not indicated on piping schedule, then not less than 200 psig, 50 psi in excess of maximum static pressure, or 150 percent of maximum operating design pressure, whichever is greater.

2. Conduct hydrostatic test for minimum two hours.
3. Filling:

   a. Fill section to be tested with water slowly and expel air from piping at high points.
   b. Install corporation cocks at high points.
   c. Close air vents and corporation cocks after air is expelled.
   d. Raise pressure to specified test pressure.

4. Observe joints, fittings, and valves under test.
5. Remove and renew cracked pipe, joints, fittings, and valves showing visible leakage and retest.
6. Leakage:

a. Correct visible deficiencies and continue testing at same test pressure for additional two hours to determine leakage rate.
b. Maintain pressure within plus or minus 5 psi of test pressure.
c. Leakage is defined as quantity of water supplied to piping necessary to maintain test pressure during period of test.
d. Compute maximum allowable leakage by following formula:

1) L = SD x sqrt(P)/C.
2) L = testing allowance in gph.
3) S = length of pipe tested in feet.
4) D = nominal diameter of pipe in inches.
5) P = average test pressure during hydrostatic test in psig.
6) C = 148,000.
7) If pipe under test contains sections of various diameters, calculate allowable leakage from sum of computed leakage for each size.

e. If test of pipe indicates leakage greater than allowed, locate source of leakage, make corrections, and retest until leakage is within allowable limits.
f. Correct visible leaks regardless of quantity of leakage.

3.6 CLEANING

A. Keep pipe interior clean as installation progresses.

B. After installation, clean pipe interior of soil, grit, and other debris.

SECTION 400523 - STAINLESS STEEL PROCESS PIPE AND TUBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Stainless steel pipe and fittings.
2. Stainless steel tube and fittings.
3. Accessories.

B. Related Requirements:

1. Sections of Division 40 “Instrumentation and Controls”, other than those specified herein, are specified under their respective Sections.
2. Section 400506 "Couplings, Adaptors, and Specials for Process Piping" for pipe penetrations, restrained joints, flexible connections, expansion joints and loops, and sleeve-type couplings.
3. Section 400551 "Common Requirements for Process Valves" for common product requirements for valves for placement by this Section.
4. Section 400507 “Hangers and Supports for Process Piping” for hangers, anchors, sleeves and sealing of piping to adjacent structures.

1.3 COORDINATION

A. Coordinate Work of this Section with piping and equipment connections as specified in other Sections.

1.4 PREINSTALLATION MEETINGS

A. Convene minimum one week prior to commencing Work of this Section.

1.5 ACTION SUBMITTALS

A. Product Data: Submit manufacturer information on pipe materials, tube materials, and fittings.

B. Shop Drawings:

1. Indicate piping layouts and schedules, with dimensions, fittings, expansion joints, locations of valves and appurtenances, joint details, wall penetration details, methods, types and locations of hangers and supports, and pertinent technical specifications for piping to be furnished.
2. Include data and information required for complete piping systems. Base dimensions on actual equipment to be furnished. Show types and locations of pipe hangers and/or supports on layouts for each pipe submittal. Since not all dimensions will be checked by Engineer, nor will every detail be reviewed by Engineer, Contractor will be responsible for accurate dimensioning of piping systems.

C. Cleaning Methods:

1. Include pre-cleaning, descaling, chemicals to be used, or mechanical descaling method, post-weld cleaning to restore corrosion resistance and final cleaning/passivation/pickling.
2. Include method and schedule for drying pipe so that it is ready for service as part of proposed cleaning method.
3. Include name and qualifications of firm that will be doing cleaning.
4. Include name and qualifications of independent firm that will be doing inspection of cleaned pipe.

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

E. Welder Certificates: Submit welders' certification of compliance with AWS D1.1/D1.1M, verifying qualification within previous 12 months.

1.6 DELEGATED DESIGN SUBMITTALS

A. Delegated Design Submittals: Where pipe sizing has been delegated as shown on plans, submit signed and sealed Shop Drawings with design calculations and assumptions for pipe sizing methods and calculations used.

1.7 INFORMATIONAL SUBMITTALS

A. Source Quality-Control Submittals: Indicate results of factory tests and inspections.

B. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

C. Qualifications Statements:

1. Submit qualifications for manufacturer, installer, and licensed professional.
2. Submit manufacturer's approval of installer.

1.8 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of valves, fittings, and appurtenances, connections, and invert elevations.

B. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

© 2026 CDM Smith
All Rights Reserved

1.9 QUALITY ASSURANCE

A. Furnish stainless steel pipe and fittings by a single manufacturer who is fully experienced, reputable, qualified and regularly engaged for the last 5 years in manufacture of materials to be furnished.

B. Permanently mark each length of pipe with manufacturer's name or trademark, and compliance with standards.

C. Materials in Contact with Potable Water: Certified according to NSF/ANSI 61 and NSF/ANSI 372.

D. Fabricator Qualifications: Factories, including mills, foundries, factories and machine shops, which hold a current ISO 9001 Certificate of Quality System Registration. Furnish documentation necessary to verify Supplier’s certification and registration.

E. Furnish work in new and unused condition. Include products and services from Suppliers having a successful record of manufacturing and servicing Work specified herein for a minimum of 10 years prior to Effective Date of Agreement.

F. Perform and document quality control (QC) and quality assurance (QA) procedures performed during manufacturing at factory; during loading of Work for transport at factory; during transport to Site; during unloading and storage of Work at Site; and during installation and startup at Site, all part of Work specified herein.

G. Owner and Engineer will perform independent testing of Work, herein referred to as “QA verification”, at any time during manufacturing at factory; during loading for transport at factory; during transport to Site; during unloading and storage at Site; and during installation and startup at Site. Owner will provide an industry specialist and Engineer to perform QA verification procedures. Allow unhindered access to Owner and Engineer, including access for still and video photography of Work.

H. Owner will provide an industry specialist and Engineer to perform QA verification procedures. QA Verification will include chemical analysis, examination, and testing as specified, following QA and QC procedures performed by Supplier and Contractor. Allow unhindered access to Engineer, including access for progress photographs and video documentation of work. Remove and replace, at no increase in Contract Price or Contract Time, defective Work, verified in non-compliance with acceptance criteria specified herein.

I. Where Defective Work is identified and rejected, based on QA verification, provide additional QA verification analyses, inspections and testing performed by Owner or Engineer on corrected Work.

J. In addition, reimbursement for subsequent QA verification inspections includes repeat QA verification analyses, testing and/or inspection related costs, including costs associated with personnel travel expenses described above; laboratory analysis; and repeat testing or inspection report review and analysis by Owner or Engineer.

K. Design, manufacture, deliver and install products in accordance with requirements of specified herein. Provide new and unused products specified herein from Suppliers having a successful record of manufacturing and servicing products specified herein for a minimum of 10 years.

L. Submit to Engineer, four copies of certified mill test reports (MTRs) for chemical analysis, mechanical properties including tensile, impact, and bend test results for materials used in manufacture of products specified herein. Verify MTRs identify products, for which material will be used, and information necessary to verify compliance with requirements specified herein.

M. If there are difficulties in operation of systems included under this Contract due to defective Work, correct defective Work and meet acceptance testing requirements.

N. Inspection by Owner or Engineer or failure to inspect does not relieve Contractor of his responsibility to provide materials and perform Work in accordance with Contract Documents.

1.10 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' documented experience.

B. Installer: Company specializing in performing Work of this Section with minimum three years' documented experience.

C. Welders: AWS qualified within previous 12 months for employed weld types.

D. Licensed Professional: experienced in design of specified Work and licensed at Project location.

E. Welding Qualifications: Qualify procedures according to AWS D1.1/D1.1M, "Structural Welding Code – Steel."

F. Pipe and Pressure-Vessel Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Protect piping and appurtenances by storing off ground.
3. Provide additional protection according to manufacturer instructions.

1.12 AMBIENT CONDITIONS

A. Minimum Conditions: Do not store or handle uninstalled lined pipes or fittings at temperatures below zero degrees F.

© 2026 CDM Smith
All Rights Reserved

1.13 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.14 WARRANTY

A. Special Warranty: Manufacturer and Installer agree to repair or replace components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: three years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 STAINLESS STEEL TUBE AND FITTINGS

A. Tube:

1. Type: Seamless.
2. Comply with ASTM A269/A269M.
3. Grade: Type 304/304L.

B. Seamless Stainless Steel Alloy Tube:

1. Install seamless stainless steel alloy tube, ¼-inch to 2½-inch diameter in designated size and wall thickness as scheduled and indicated on Drawings.
2. Provide seamless tube manufactured from the following alloys in accordance with designated ASTM standard:

a. ASTM A269, Grade S30403, (304L) austenitic stainless steel (ASME P-8), ID and OD; mechanically polished to a No. 2B finish, as a minimum.
b. Provide seamless annealed stainless steel alloy tube manufactured and/or distributed by:

1) Tioga Pipe Supply Company, Philadelphia, Pennsylvania.
2) Outokumpu Piping Products, Wildwood, Florida.
3) Rath Gibson, Janesville, Wisconsin.
4) Swagelok, Solon, Ohio.
5) Plymouth Tube, Warrenville, Illinois.
6) Bristol Metals (Brismet), Bristol, Tennessee.
7) Alaskan Copper Works, Seattle, Washington.

C. Fittings:

1. Threaded:

a. Comply with ASTM A182 and ASME B16.11.

b. Grade: Type 304/304L
c. Threads: Comply with ASME B1.20.1.

2. Butt-Welding Fittings:

a. Comply with ASTM A403/.
b. Grade: Type Type 304/304L

3. Socket-Welding Fittings:

a. Comply with ASTM A403.
b. Grade: Type Type 304/304L

4. Welded Stainless Steel Tube Fittings

a. Only use welded stainless steel tube fittings, 3 inch to 12 inch diameter with ASTM A778 light-wall extra-low-carbon stainless steel pipe,; designed and manufactured in accordance with ASTM A774; fitting dimensions in accordance with MSS SP-43.
b. Provide welded stainless steel tube fittings manufactured from the following alloys in accordance with designated ASTM standard:

1) ASTM A774, Grade TP304L (extra low carbon (<0.03%) alloy for welded fabrication) austenitic for tube manufactured from ASTM A778 Type 304L extra-low carbon light-wall austenitic stainless steel.
2) ASTM A774, Grade TP316L (extra low carbon (<0.03%) alloy for welded fabrication) for pipes manufactured from ASTM A778 Type 316L extra-low carbon light-wall austenitic stainless steel.

c. Provide low-pressure light-wall fittings for stainless steel pipe manufactured and/or distributed by one of the following:

1) Felker Brothers, Marshfield, Wisconsin.
2) Douglass Brothers, Portland, Maine.
3) Swepco Tube, Clifton, New Jersey.

5. Compression Tube Fittings and Adapters

a. Use compression fittings and adapters constructed of same material as connecting tube, ¼-inch to 2½-inch diameter, on stainless steel tube where specified and indicated on drawings.
b. Provide all threaded joints for medium pressure oil hydraulic tube fittings of SAE straight-thread O-ring end-seal type.
c. Provide compression type couplings between tubes, bends and adapters for oil hydraulics.
d. Provide one of the following compression fittings for stainless steel tube:

1) Tube fittings and adapters manufactured by Swagelok, Solon, Ohio.
2) Gyrolok fittings manufactured by Hoke, Spartanburg, South Carolina.
3) Tube fittings manufacture by Tube Fittings Division, Parker Hannifin Corporation, Columbus, Ohio.

4) Tube fittings manufactured by Brennan Industries, Solon, Ohio.

6. Flared 37 Degree Tube Fittings and Adapters

a. Use flared 37 degree fittings and adapters ¼-inch to 2-inch diameter on tube fittings where indicated on Drawings. Do not used on oil hydraulic systems. Provide dimensions in accordance with SAE J514 and threads in accordance with ASME B1.20.1.
b. Meet the following material standards:

1) ASTM A182, Grade F304/F304L (ASME P-8) (L – low alloy for welded fabrication) Austenitic for tubes manufactured from ASTM A269, Type 304/304L.

c. Provide flared fittings manufactured by one of the following::

1) Parker Hannifin Corporation, Columbus, Ohio.
2) Brennan Industries, Solon, Ohio.
3) Swagelok, Solon, Ohio.

7. Flared 45 Degree Tube Fittings and Adapters

a. Use f fittings and adapters ¼-inch to 2-inch diameter where specified and indicated on Drawings. Provide dimensions in accordance with SAE J513 or SAE J512 with threads in accordance with ASME B1.20.1 and bodies forged to ASTM A182.
b. Meet the following material standards:

1) ASTM A182, Grade F304/F304L (ASME P-8) (L – low alloy for welded fabrication) Austenitic for tubes manufactured from ASTM A269, Type 304/304L.

c. Provide flared 45 degree fittings from one of the following manufacturers:

1) Parker Hannifin Corporation, Columbus, Ohio.
2) Brennan Industries, Solon, Ohio.
3) Mueller Industries, Covington, Tennessee.

2.2 ACCESSORIES

A. Pipe-Thread Tape:

1. Material: PTFE.
2. Comply with ASTM D3308.

B. O-Ring Seals: EPDM.

C. Anti-seize Bolting Lubricants:

1. Install flange bolts using a nickel anti-seize lubricant capable of achieving required bolt torque and sealing stress and permitting future disassembly with minimal manual input.

2. Remove excess anti-seize compound by degreasing solvent prior to finish painting piping.
3. Anti-Seize Compound:

    a. Never-Seez Pure Nickel Special Lubricant manufactured by Bostik, Wauwatosa, Wisconsin.
    b. Loctite Heavy Duty Anti-Seize Lubricant Manufactured by Henkel Technologies, Rocky Hill, Connecticut.
    c. Chesterton 772 Premium Nickel Anti-Seize Compound manufactured by Chesterton Technical Products, Stoneham, Massachusetts.

4. Flange Bolts: Adequately degreased of all corrosion inhibiting slush oil and excess anti-seize lubricant prior to field application of prime and finish coatings.

2.3 SOURCE QUALITY CONTROL

A. Section 14000 “Quality Requirements”: Requirements for testing, inspection and analysis.

B. Provide shop inspection and testing of completed assembly.

C. Owner Inspection:

1. Make completed tubingcomponents available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

D. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.
3. Coordinate QC and QA testing of Work to be witnessed by Owner or Engineer in factory, such that they may be conducted on consecutive days and completed during a single trip. Notify the Engineer of scheduled factory QC and QA testing and inspections three (3) weeks, as a minimum, prior to first scheduled testing date.

E. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design, and verify that new pipe and flange mate properly.

3.2 PREPARATION

A. Ream tube ends and remove burrs.

B. Thoroughly clean pipe and fittings before installation.

3.3 INSTALLATION

A. Comply with ASME B31.3. Install pipe, fittings and specials true to alignment and rigidly supported. Do not exceed deflection at pipe joints recommended by *Supplier*. Support all pipe and appurtenances connected to equipment to prevent any strain on equipment and valves nozzles, and adjoining pipe flanges

B. Run piping straight along alignment as indicated on Shop Drawings, with minimum number of joints.

C. Fittings:

1. Clean gasket seats thoroughly, and wipe gaskets clean prior to installation.
2. Install according to manufacturer instructions.
3. Bolting:

    a. Tighten bolts progressively, drawing up bolts on opposite sides until bolts are uniformly tight.
    b. Use torque wrench to tighten bolts to manufacturer instructions.

D. Concrete encase pipe under concrete slabs. Wrap stainless steel pipe in a protective material, such as a petrolatum tape or coat pie as needed, prior to encasement.

E. Provide required upstream and downstream clearances from devices as indicated on Shop Drawings.

F. Install piping with sufficient slopes for venting or drainage of liquids and condensate to low points.

G. Provide expansion joints as specified in Section 400506 - Couplings, Adaptors, and Specials for Process Piping to compensate for pipe expansion due to temperature differences.

H. Dielectric Fittings: Provide between dissimilar metals.

I. Field Cuts: According to pipe manufacturer instructions.

J. Field welding of stainless steel is not permitted.

K. Joining preparation and finished welds: Under no circumstances may permanent backer-rings or other consumable inserts be used for field or shop welding of steel pipe. Non-consumable refractory inserts are allowed with Engineer’s approval.

L. Assemble joints between straight lengths of carbon steel pipe with full-penetration groove welds. Make full-penetration butt-welded field joints for pipe larger than 8 inch diameter using line-up clamps. Submit alternative methods to line-up clamps proposed with welding submittals for Engineer's approval.

M. Join socket-welded fittings, used with seamless mill grade stainless steel piping, by fillet welding as indicated on Drawings. Use socket welded fittings only on oil fluid power system piping.

N. Prepare pipe joints by a machining process without damage to pipe exterior. Cut ends smooth and at a right angle to axis of pipe and beveled where required in accordance with approved welding procedure specifications. Deburr pipe and tube as part of preparation of all joint configurations.

O. Rust spots and corrosion pits on new stainless steel pipe and fittings are not allowed. Verify pipe, tube and fittings are inspected by the Engineer and Contractor upon delivery and stored in a location that will prevent entry of contaminants prior to installation.

P. Protect pipe, tube, fittings and valves, and adhere to the following mandatory requirements, and others specified in paragraphs below:

1. Protect stainless steel materials from contact with carbon steel including but not limited to hoisting and rigging equipment, steel tables, storage racks and hand tools.
2. Do not bundle pipe and fittings using ferrous metal banding at factory or Supplier's facility.
3. Do not allow contact between wear surfaces of tools used for carbon steel fabrication and surfaces of stainless steel pipe, tubes and fittings. These tools include abrasive grinding and cutting wheels, wheel cutters and rollers, threading taps and dies, tube bending equipment and all other bearing edge tools.
4. Use manual or powered wire brush tools for surface repair and joint preparation manufactured from stainless steel. Brushes with carbon steel wire cannot be used for fabrication of stainless steel.
5. Shield stainless steel pipe, tube and fittings from all on-site carbon steel pipe and structural steel cutting and blasting operations.
6. Remove all exterior surface scratches; surface contamination by ferrous metal grinding kerf; contamination by paint markers and crayons etc.; and labels after installation.

Q. Verify engineer examines exterior surfaces of pipe, tube and fittings at Site for free iron contamination by ferroxyl test or other method. Clean all contaminated surfaces at Site by pickling using a lean spray-applied pickling cleaner suitable for large surfaces system. Follow pickling with passivation of entire treated surface by a neutralizing rinse. Provide one of the following spray-applied pickling solutions:

1. Avesta Classic Cleaner 401®, manufactured by Avesta Finishing Chemicals, Orchard Park, New York.
2. Antox® 75E Pickling Cleaner, manufactured by Chemetall US, New Providence, New Jersey.
3. Kytex® Brightener 123, manufactured/distributed by Harvard Chemical Research, Atlanta, Georgia.

R. Perform field cutting of stainless steel pipe by mechanical wheel cutter or abrasive saw, leaving a smooth cut at right angles to axis of pipe. Use new abrasive cutting wheels for stainless steel pipe and tube designed to prevent iron, sulfur or chlorine contamination to surface under preparation or repair, and surfaces of adjacent piping. Deburr pipe and tube as part of preparation for all joint configurations. Abrasive cutting wheels acceptable for use on stainless steel pipe and tube as follows:

1. Charger® cutting wheels manufactured by Norton/Saint-Gobain Abrasives, Worcester, Massachusetts.
2. Saitech Z-Tech® cutting wheels manufactured by United Abrasives/SAIT, Windham, Connecticut.
3. pecialist® cutting wheels manufactured by Flexovite, Angola, New York.

S. Perform field grinding of stainless steel pipe and tube, including root pass and enter-pass weld grinding using new grinding wheels. Use grinding wheels designed to prevent iron, sulfur or chlorine contamination to surface under repair or surfaces of adjacent piping. Abrasive grinding wheels acceptable for use on stainless steel pipe and tube as follows:

1. Norzon Plus® grinding wheels manufactured by Norton/Saint-Gobain Abrasives, Worcester, Massachusetts.
2. Saitech Pipeline® grinding wheels manufactured by United Abrasives/SAIT, Windham, Connecticut.
3. Flexon® ZA24S grinding wheels manufactured by Flexovite, Angola, New York.

T. Use wire wheels, to remove defects on pipe surface after installation, constructed of same material as pipe wall or Type 316 stainless steel for super austenitic and duplex stainless steel piping. Verify surface finish on pipe meets specified mill-applied surface finish or better.

U. Installation of Grooved Joint Couplings and Fittings:

1. Assemble steel grooved-joint couplings on piping systems in accordance with latest version of Manual I-100 “Field Installation Handbook” published by Victaulic Company, Easton, Pennsylvania.
2. Install coupling gaskets using Supplier’s standard lubricant compatible with elastomer gaskets. Complete lubrication of gasket exterior, gasket sealing lips, housings, and pipe ends prior to joining to prevent gasket pinching.
3. Tighten coupling nuts evenly by alternating sides until metal-to-metal contact occurs at bolt pads. For angle-bolt-pad couplings, even offsets must be present at bolt pads to obtain pipe-joint rigidity.

V. Bolting Procedure for Flanged Joints:

1. Assemble flanged pipe joints in accordance with gasket Supplier’s instructions and as specified herein. Utilize calibrated bolting equipment capable of applying a measured torque to flange bolts during assembly. Submit bolting patterns, procedures and bolting equipment data to Engineer prior to pipe fitting and bolting.
2. Use hydraulic cassette wrenches for assembly of flanged pipe joints requiring greater than 900 ft-lbs of assembly torque. Document each flanged joint assembly included in Work using “Flange Bolting Worksheet” at end of this Section. Do not use torque multipliers. Engineer reserves right to require documentation of any flange joint requiring less than 900 ft-lbs of bolt torque.

3. Calculate clamping forces and target assembly torque for assembly of all flanged pipe joints included in Work. Verify calculations take into consideration pipe diameter, gasket Supplier's recommended assembly stress; bolt material tensile and yield stress; gasket Supplier's recommended bolt stress; pipe service, design and test pressures. Verify calculations are stamped by a professional engineer.
4. Visually inspect and clean flange bolts, stud-bolts, nuts and washers prior to bolting. Lubricate bolts and nuts; if hardened washers are not used, lubricate flange surface around bolt holes. Remove excess lubricant on surfaces to receive protective coatings by cleaning and degreasing solvent prior to applying a coating system.
5. Hand-tighten all nuts and bolts, then tighten them to 10 to 20% of target torque. Do not exceed 20% of target torque, for initial torque. Tightened bolts according to pattern recommended by gasket Supplier. Do not reuse nuts removed during disassembly of existing or newly assembled joints. Dispose of used nuts in presence of Engineer.
6. Perform three rounds of bolt tightening on flanges having 4 to 8 bolts following hand tightening, first to 30 percent; then 60 percent; and finally, 100 percent of target torque calculated by Contractor.
7. Perform four rounds of bolt tightening for flanges having 12 bolts or more, following hand tightening, first to 20 percent; then 40 percent; then 80 percent, and then 100 percent of target torque calculated by Contractor.
8. Measure gap between flanges following application of 100 percent of target at every other bolt to confirm uniformity. Perform a final re-tightening to 100% of target torque 24-hours after 100 percent tightening at end of initial bolting sequence. Verify every bolt and stud-bolt has a minimum of three full threads exposed beyond nut following final tightening.
9. Fill out "Flange Bolting Worksheet", located at end of this Section, for all flanged joints on project. Identify joints in accordance with designation included in approved laying schedule. Submit form to Engineer at end of each workday, after 24-hour re-tightening sequence, for filing in project records.

W. Installation of Stainless Steel Tube:

1. Install tubing using compression fittings and adapters or by welding.

    a. Tubing to be Used with Compression Fittings: Bright annealed and electro-polished as specified above and protected from scratches and deformation during shipping, storage on site and assembly.

2. Minimize use of fittings by tube bending. Perform tube bending using manual or mechanized dies designed for use with annealed stainless steel tube.
3. Cut stainless steel tube to length using cutter-wheel type tube cutters. Debur cut tube ends prior to swaging or welding. For all edge tool components used for installation of stainless steel tube use only new or dedicated for use with stainless steel equipment.

X. Installation of Compression Tube Fittings

1. Install compression fittings for annealed stainless steel tubing in accordance with manufacturer's instructions. Remove all markings applied to tube and fittings during assembly by solvent cleaning after installation. General installation requirements below are based upon use of Swagelok tubing and serve as minimum requirement. Adhere to manufacturer's instructions during installation. Do not mix nuts and ferrules from different tube fitting manufacturers.

2. Swage compression fittings 1-inch diameter and smaller manually. Hand-tighten nut, and then turn another 1 and ¼ turns by a manual wrench to engage ferrule to tube wall. Compression ferrules for fittings larger than 1 inch diameter hydraulically swaged to tube by a hydraulic swaging tool in accordance with manufacturer's instructions. Apply manufacturer's standard lubricant to body threads and back of ferrule prior to swaging. Verify Engineer inspects fittings after initial assembly for proper pull-up with gap inspection gauges.
3. Install adapter fittings in accordance with requirements below for type of connecting joint, including SAE straight thread O-ring joints, standard tapered threaded joints, SAE hydraulic flanges and welded joints.
4. Do not use thread sealant with SAE straight O-ring threaded joints.
5. Do not use standard tapered threaded joints adapters or liquid thread sealants used for oil operated hydraulic fluid lines. In addition, do not use NPTF Dryseal threads for any adapters for use with any service.
6. Disassemble welded adapters prior to tack welding and re-lubricate prior to hydraulic swaging after welding. Remove all adjacent O-rings and other heat sensitive materials prior to welding and/or protected with heat sinks during welding.
7. Avoid disassembly of compression fittings after initial assembly as much as possible. If a compression joint must be disassembled, mark nut and fitting nut flats to use as a guide for proper pull-up after reassembly.

3.4 FIELD QUALITY CONTROL

A. Section 017300 "Execution": Requirements for testing, adjusting, and balancing.

B. Cleaning: After installation, clean completed lines with Oakite deoxidizer or similar deoxidizer as recommended by manufacturer to remove all foreign matter, construction stains or shop markings. Rinse cleaned lines with steam or hot water. Verify all cleaning chemicals are NSF/ANSI 60 approved.

C. Inspection:

1. Inspect for damage to piping or tubing that may be detrimental as determined by Architect/Engineer.
2. Repair damaged piping, or provide new, undamaged pipe.
3. After installation, inspect for required supports and anchoring, interferences, and damage to pipe, tube, or fittings.

D. Pressure Testing:

1. Test Pressure: Not less than 200 psig or 50 psi in excess of maximum static pressure, whichever is greater.
2. Conduct hydrostatic test for minimum two hours.
3. Filling:

    a. Fill section to be tested with water slowly and expel air from piping at high points.
    b. Install corporation cocks at high points.
    c. Close air vents and corporation cocks after air is expelled.
    d. Raise pressure to specified test pressure.

4. Observe joints, fittings, and valves under test.
5. Remove and renew cracked pipe, joints, fittings, and valves showing visible leakage and retest.
6. Leakage:

    a. Correct visible deficiencies and continue testing at same test pressure for additional two hours to determine leakage rate.
    b. Maintain pressure within plus or minus 5 psi of test pressure.
    c. Leakage is defined as quantity of water supplied to piping necessary to maintain test pressure during period of test.
    d. Compute maximum allowable leakage by following formula:

        1) L = SD x sqrt(P)/C.
        2) L = testing allowance, in gallons per hour.
        3) S = length of pipe tested, in feet.
        4) D = nominal diameter of pipe, in inches.
        5) P = average test pressure during hydrostatic test, in psig.
        6) C = 148,000.
        7) When pipe under test contains sections of various diameters, calculate allowable leakage from sum of computed leakage for each size.

    e. If test of pipe indicates leakage greater than allowed, locate source of leakage, make corrections, and retest until leakage is within allowable limits.
    f. Correct visible leaks regardless of quantity of leakage.

3.5 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.6 CLEANING

A. Keep pipe interior clean as installation progresses.

B. After installation, clean pipe interior of soil, grit, and other debris.

SECTION 400524 - STEEL PROCESS PIPE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Plastic-lined steel pipe.
2. Fittings.
3. Accessories.

B. Related Requirements:

1. Section 099679 “Atmospheric Protection and Plant Service Areas Coating” “”: Finishes as required by this Section.
2. Section 400506 “Couplings, Adapters, and Specials for Process Piping”: Pipe penetrations, restrained joints, flexible connections, expansion joints and loops, and sleeve-type couplings.
3. Section 400507 “Hangers and Supports for Process Piping”: Hangers, anchors, sleeves, and sealing of piping to adjacent structures.
4. Section 400551 “Common Requirements for Process Valves”: Common product requirements for valves for placement by this Section.

1.3 COORDINATION

A. Coordinate Work of this Section with piping and equipment connections specified in other Sections and indicated on Drawings.

1.4 ACTION SUBMITTALS

A. Product Data: Submit manufacturer information regarding pipe and fittings.

B. Shop Drawings: Indicate layout of piping systems, including equipment, critical dimensions, sizes, and material lists, locations of all expansion joints, supports, anchors, harnessing, valves, etc.

C. Complete schedule of all components included in the pipeline drawings, indicating the materials and schedule number of thickness of all pipe, the materials and class of all fittings and valves.

D. Details of pipe coating, wrapping, lining, and painting.

© 2026 CDM Smith
All Rights Reserved

1.5 DELEGATED DESIGN SUBMITTALS

A. Submit signed and sealed Shop Drawings with piping layout and with design calculations and assumptions for pipe sizing methods.

1.6 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

B. Welder Certificates: Submit welders' certification of compliance with AWS D1.1/D1.1M, verifying qualification within previous 12 months.

C. Source Quality-Control Submittals: Indicate results of factory tests and inspections and provide required certifications including certified materials test reports indicating physical and mechanical properties and heat treatment for all piping components.

D. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

E. Qualifications Statements:

1. Submit qualifications for manufacturer, installer, and licensed professional.
2. Submit manufacturer's approval of installer.

1.7 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping, valves and other appurtenances, connections, and centerline elevations.

B. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.8 QUALITY ASSURANCE

A. Permanently mark each length of pipe with manufacturer's name or trademark and indicate conformance to standards.

B. Materials in Contact with Potable Water: Certified according to NSF 61 and NSF 372.

C. Perform Work according to Project standards.

D. Maintain one of each standard affecting Work of this Section on Site.

E. Roll or permanently inscribe the manufacturer's name or trademark, the year of manufacture and the ASTM or API specification number on the pipe surface at the manufacturer's plant. Alternately, stencil the manufacturer's name or trademark, year of manufacture and ASTM or API specification number on the pipe surface. Pipe 1-1/2 inches and less in nominal diameter shall be bundled and tagged.

F. Utilize only certified welders, having current certificates conforming to the requirements of the ASME code to perform all welding on steel pipes. Welders to be qualified under the requirements of Section IX Welding Qualifications, of the ASME Boiler and Pressure Vessel Code.

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' documented experience.

B. Installer: Company specializing in performing Work of this Section with minimum five years' documented experience.

C. Welders: ASME qualified within previous 12 months for employed weld types.

D. Licensed Professional: Professional engineer experienced in design of specified Work and licensed in the State of New York.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Protect piping and appurtenances by storing off ground.
3. Provide additional protection according to manufacturer instructions.

1.11 AMBIENT CONDITIONS

A. Minimum Conditions: Do not store or handle uninstalled lined pipes or fittings at temperatures below zero degrees F.

1.12 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 STEEL PIPE AND FITTINGS

A. Sodium Hypochlorite Service Piping:

1. Comply with ASTM A106/A106M; Grade B.
2. Dimensions: Comply with ASME B36.10M.

B. Joints:

1. Description: Flanged.

C. Fittings:

1. Type:

a. Flanged.

2. Dimensions: Comply with ASME B36.10M.
3. Flanged Connections: All locations.
4. Flanged Fittings:

a. Van Stone flanges shall not be used with pinch valves, industrial butterfly valves; elastomer bellows style expansion joints or other piping system components having an elastomer liner (rubber seat) that is used as a gasket.
b. Forged Steel: Comply with ASTM A105/A105M.
c. Steel flanged fittings:

1) Forged steel slip-on flanges.
2) Class 125 and Class 250 fittings, ASME B16.5, 150 pound or 300 pound, except flanges that are flat faced.

d. Class 125 fittings, AWWA C207, Class B.
e. Cast steel flanged fittings to be assembled with forged steel flanges of the same pressure rating, conforming to ASME B16.5.
f. Facing and Drilling:

1) Comply with ASME B16.5.

g. Backing Flanges:

1) Material: Cast steel.
2) Comply with ASTM A216/A216M
3) Class: 150.
4) Type: Van stone.
5) Drilling: Comply with ASME B16.5.

h. Fasteners:

1) Bolts: Comply with ASTM A193/A193M hex head.

2) Nuts: Comply with ASTM A194/A194M; hex head.
3) Washers: Constructed of same material as bolts.

2.2 PLASTIC-LINED STEEL PIPE AND FITTINGS

A. PTFE-Lined Steel Pipe and Fittings:

1. As indicated on Drawings.
2. Maximum Design Pressure: 150 psig at 80 degrees F.
3. Maximum Operating Temperature: 100 degrees F.
4. Minimum Liner Thickness: 150 mils.
5. Lock liner to shell.
6. Gaskets: FKM.

2.3 FINISHES

A. Coat machined faces of flanges with temporary rust-inhibitive coating.

B. Prepare piping for field finishes as specified in Section 099679.

2.4 ACCESSORIES

A. Pipe-Thread Tape:

1. Material: PTFE.
2. Comply with ASTM D3308.

2.5 SOURCE QUALITY CONTROL

A. Testing:

1. Provide shop inspection and testing of completed pipe sections.
2. Conduct 15,000-V minimum electrostatic spark test on each plastic-lined pipe to ensure integrity of plastic liner.
3. Test thermal shock resistance of glass-lined pipe according to ASTM C600.

B. Owner Inspection:

1. Make completed pipe sections available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

E. Engineer reserves the right to perform shop inspections of the manufacture of the pipe. Provide at least 30 days' notice to the Engineer prior to the beginning of any work so that inspection may be arranged. Furnish all facilities required for the inspection of materials and workmanship in the shop.

1. Inspection may include, welding inspection, review of certified material test reports, traceability check, and witness of assembly and fit-up. Prior to manufacture, the pipe fabricator shall supply the following information on suppliers of plate, piping, and other components: Items(s) furnished, company name and address, contact name, telephone and fax number. The Engineer reserves the right to visit any or all of the suppliers and conduct inspections at their facilities.
2. The inspector has the authority to reject any material or work that does not meet the requirements of the Contract Documents.
3. Inspection at the shop is intended as a means of facilitating the work and avoiding errors. Shop inspection does not relieve the responsibility for furnishing proper materials or workmanship.
4. Engage inspectors to inspect welded connections and to perform tests and prepare test reports. Perform non-destructive testing as required by the specification under which the pipe is manufactured.
5. Correct or reweld and retest deficient welds to the specified requirements as determined by the Engineer and/or an independent testing lab.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Drawings.

B. Inspect existing flanges for nonstandard bolt-hole configurations or design and verify that new pipe and flange mate properly.

3.2 INSTALLATION

A. According to ASME B31.3.

B. Run piping straight along alignment as indicated on Drawings, with minimum number of joints.

C. Fittings:

1. Clean gasket seats thoroughly and wipe gaskets clean prior to installation.
2. Install fittings according to manufacturer instructions.
3. Bolts:

a. Determine torque per AWWA M11.
b. Tighten bolts progressively, drawing up bolts on opposite sides until bolts are uniformly tight.
c. Use torque wrench to tighten bolts to manufacturer instructions.
d. Project 1/4-inch beyond the nut when joint with gasket is assembled.

D. Provide required upstream and downstream clearances from devices as indicated on Drawings.

E. Install piping with sufficient slopes for venting or draining liquids and condensate to low points.

F. Support exposed piping as specified in Section 400507 “Hangers and Supports for Process Piping.” Where temporary supports are used during construction, provide sufficient strength and rigidity to prevent shifting or distortion of the pipe.

G. Provide expansion joints as specified in Section 400506 “Couplings, Adapters, and Specials for Process Piping”, and provide pipe guides as specified in Section 400507 “Hangers and Supports for Process Piping”, to compensate for pipe expansion due to temperature differences.

H. Dielectric Fittings: Provide between dissimilar metals.

I. When required, cut pipe by machine in a neat workmanlike manner without damage to the pipe. Cut ends to be smooth and at right angle to the axis of the pipe. Clean all steel pipe thoroughly before installation including smoothing and cleaning interior and exterior cut ends. All uncoated pipes to be placed on end and hammered to remove scale and loose particles. Repair lining damage to the satisfaction of the Engineer before the pipe is installed.

J. Welding of steel butt-welding fittings, steel fabricated fitting and steel pipe to be in strict conformity with the Code for Pressure Piping, ASME B31.1, Section 6 and its Supplements. Submit Certificates of qualifications of current issue, conforming to the requirements of the Code to the Engineer before proceeding with any pipe welding. Use backing rings of carbon steel with spacer nubs that strike-off or melt with the weld for all pipe welding butt joints unless otherwise specified.

K. Perform field welding of cement mortar lined steel pipe only where approved and in accordance with AWWA C206. Use flanged or other approved joints not approved for field welding.

1. Machine cut the ends of the lined pipe for pipe-to-pipe joints to provide an approximate bevel of 27-1/2 degrees. Ends may be chipped provided there is no damage to the cement lining, cleaned of scale, rust, oil and other foreign matter. Where fittings already having a bevel of 37-1/2 degrees are to be welded to pipe, pipe ends to be beveled to a 17-1/2 degree angle, making a total angle of bevel between joints of approximately 55 degrees. A 1/8-inch land to be provided where possible.
2. Pipe ends to be joined will be approximately 1/32 inch apart before tacking. Backing rings will not be used at welded joints in cement mortar lined pipe. Small tack welds to be made using a 1/8-inch electrode. The first bead or layer of welding laid by bridging across from bevel to bevel at the bottom of the groove just at the top of the land. A suitable crown reinforcement layer to be made on the top of the joint to finish off.
3. Direct current (DC) will be used for welding, with the base material on the negative side.
4. The first pass will be a stringer bead using a 1/8-inch electrode with a current of 80 to 90 amperes at 50 to 55 Volts. The second and succeeding passes to be woven beads using a 1/8-inch electrode and a current of 90 to 100 amperes at 55 to 58 Volts. All passes to be

made slowly and with care not to burn through the land or the shoulder into the lining of the pipe. The joint will not be hotter than 100 deg. F. For large size pipe, a 5/32-inch electrode may be used, provided the temperature of the joint is held within 100 deg. F.

5. No stress relieving of welded joints is necessary unless the pipe wall thickness warrants it. After the weld is completed, the joints in the lining will be filled with a special compound of a wet slurry mix of the same cement used for the lining. Where accessible from the end of the pipe, the welded joint is to be swabbed with cement using a paint brush thoroughly wetted with the cement slurry.
6. Defects causing leaks in welded joints will be repaired by welding without damaging the cement lining using procedures similar to that specified hereinbefore.

L. Finished welds to be examined as required by AWWA C206.

3.3 TOLERANCES

A. Circumferential deflection of all pipe in-place: not to exceed 2.0 percent of the pipe diameter.

B. Install pipe within tolerance of 5/8 inch.

3.4 FIELD QUALITY CONTROL

A. Inspection:

1. Inspect for damage to pipe lining or coating and for other defects that may be detrimental as determined by Engineer.
2. Repair damaged piping or provide new, undamaged pipe.
3. After installation, inspect for proper supports and interferences.

B. Pressure Testing:

1. As indicated in piping schedule.

C. Pressure Testing: According to ASME B31.3 and pipe schedule.

3.5 CLEANING

A. Keep pipe interior clean as installation progresses.

B. After installation, clean pipe interior of soil, grit, loose mortar, and other debris.

SECTION 400531 - THERMOPLASTIC PROCESS PIPE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. PVC pipe.
2. Polyethylene (PE) pipe and tube.
3. Fittings.
4. Accessories for plastic piping.

B. Related Requirements:

1. Section 400506 “Couplings, Adapters, and Specials for Process Piping”: Pipe penetrations, restrained joints, flexible connections, expansion joints and loops, and sleeve-type couplings.
2. Section 400507 “Hangers and Supports for Process Piping”: Hangers, anchors, sleeves, and sealing of piping to adjacent structures.

1.3 COORDINATION

A. Coordinate Work of this Section with piping and equipment connections specified in other Sections and indicated on Drawings.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's catalog information regarding pipe and fittings.

B. Shop Drawings: Indicate layout of piping systems, including equipment, critical dimensions, sizes, materials lists, location of all fittings, valves, and in-line accessories.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

D. Manufacturer’s recommended butt fusion welding procedures identifying all quality control checks during the fusion procedure including the minimum and maximum allowable bead formation during the heat soak process and the final weld roll back process for the various size pipes.

E. Source Quality-Control Submittals: Indicate results of shop tests and inspections.

F. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

G. Qualifications Statements:

1. Submit qualifications for manufacturer, installer, and licensed professional.
2. Submit manufacturer's approval of installer.

1.5 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping, valves and other appurtenances, connections, and centerline elevations.

1.6 QUALITY ASSURANCE

A. Permanently mark each length of pipe with manufacturer's name or trademark and indicate conformance to standards.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience.

B. Manufacturer: Company listed with the Plastic Pipe Institute as meeting the recipe and mixing requirements of the resin manufacturer for the resin used to manufacture each of the respective thermoplastic pipe systems.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Inspection:

1. Accept materials on Site in manufacturer's original packaging and inspect for damage.
2. Manufacturer's Packaging: Comply with ASTM D3892.

B. Storage: Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from puncture, abrasion, moisture, dust, and UV by storing in clean, dry location remote from construction operations areas.
2. Protect piping and appurtenances by storing off ground.
3. Provide additional protection according to manufacturer instructions.

1.9 AMBIENT CONDITIONS

A. Minimum and Maximum Temperatures: Do not install pipe when temperature is below 40 degrees F or above 90 degrees F if pipe is exposed to direct sunlight.

B. UV Protection: Provide pipe installed above ground or outside with UV protection.

1.10 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

PART 2 - PRODUCTS

2.1 PVC PIPE, TUBE, AND FITTINGS

A. PVC Pipe and Fittings:

1. Pipe and Fittings:

a. Comply with ASTM D1785, Class 12454.
b. Schedule: 80.
c. Fittings: ASTM D2467, Schedule 80, socket.

2. Fittings: ASTM D2467, Schedule 80, socket.

2.2 HDPE PIPE AND FITTINGS

A. HDPE Pipe and Fittings:

1. Pipe: ASTM D3035 / AWWA C901 for sizes up to 3” ASTM F714 / AWWA C906 for sizes 4” and greater
2. SDR: SDR 17.0, rated for a maximum 125 psig working pressure
3. Fittings:

a. Comply with AWWA C901 or C906 for size 4 inches or greater.
b. Type: Molded to comply with ASTM D3261.
c. Minimum pressure rating equal to or greater than the pipe to which they are joined.

4. Joints: Butt fusion or Flanged.
5. Materials:

a. PE 4710 high density polyethylene resin.
b. Comply with ASTM D3350.
c. Minimum Cell Classification: 445574-C-C.

6. Contractor is responsible for the design, fabrication, and support of the temporary bypass piping. Fitting types and connections by Contractors approved means and methods.

© 2026 CDM Smith
All Rights Reserved

2.3 ACCESSORIES

A. PVC Piping:

1. Flange Bolting:

a. Hex-Head Bolts: Stainless steel; ASTM F593 Grade 316.
b. Hex-Head Nuts: Stainless steel; ASTM F594 Grade 316.

2. Flange Gaskets:

a. Type: Full faced.
b. Material: EPDM.
c. Comply with ASME B16.21.

3. Push-On Joint Seals:

a. Material: EPDM.
b. Comply with ASTM F477.

4. Solvent Cement:

a. Comply with ASTM D2564.
b. Formulated for use with sodium hypochlorite and other caustic solutions.
c. Primers: Comply with ASTM F656, manufactured by the solvent weld cement manufacturer.

2.4 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed pipe sections.

B. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design and verify that new pipe and flange mate properly.

© 2026 CDM Smith
All Rights Reserved

3.2 PREPARATION

A. Thoroughly clean pipe and fittings before installation.

B. Cleaning: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. Comply with ASME B31.3 and B31.9.

B. Run piping straight along alignment as indicated on Shop Drawings, with minimum number of joints.

C. Fittings:

1. According to manufacturer instructions.
2. Gaskets:

a. Clean seats thoroughly.
b. Wipe gaskets clean prior to installation.

3. Tighten bolts progressively, drawing up bolts on opposite sides until bolts are uniformly tight; use torque wrench to tighten bolts to manufacturer instructions.

D. Provide required upstream and downstream clearances from devices as indicated.

E. Install piping with sufficient slopes for venting or drainage of liquids and condensate to low points.

F. Support exposed piping as specified in Section 400507 “Hangers and Supports for Process Piping”.

G. Provide expansion joints as specified in Section 400506 “Couplings, Adapters, and Specials for Process Piping”, and provide pipe guides as specified in Section 400507 “Hangers and Supports for Process Piping”, to compensate for pipe expansion due to temperature differences.

H. Field Cuts: According to pipe manufacturer instructions.

I. Joining:

1. Heat Joining: Comply with ASTM D2657.

a. Butt-fusion joints to be done by a factory-qualified joining technician as designated by the pipe manufacturer.
b. Field Samples: join two sample welds on each size of pipe to be installed using the same fusion welding equipment that will be used for completion of the entire work. These sample welds will be compared to the manufacturer’s sample previously submitted in accordance with Part 1.
c. Pipe joints with beads in excess of 3/16-in will not be approved by the Engineer.

2. Electrofusion: Comply with ASTM F1290.

3. Primers and Cleaners: Comply with ASTM F402.
4. PVC Solvent-Cemented Joints: Comply with ASTM D2855.

3.4 FIELD QUALITY CONTROL

A. Inspection:

1. Inspect for piping defects that may be detrimental as determined by the Engineer.
2. Repair damaged piping, or provide new, undamaged pipe.
3. After installation, inspect for proper supports and interferences.

B. Pressure Testing:

1. Test Pressure: Not less than 150 psig or 1.5 times the system's working pressure, whichever is greater.
2. Conduct hydrostatic test for minimum two hours.
3. Filling:

    a. Fill section to be tested with water slowly and expel air from piping at high points.
    b. Install corporation cocks at high points.
    c. Close air vents and corporation cocks after air is expelled.
    d. Raise pressure to specified test pressure.

4. Observe joints, fittings, and valves under test.
5. Remove and renew cracked pipe, joints, fittings, and valves showing visible leakage and retest.

3.5 CLEANING

A. Keep pipe interior clean as installation progresses.

B. Clean pipe interior of soil, grit, shavings, and other debris after pipe installation.

END OF SECTION 400531

SECTION 400532 – DOUBLE WALL CHEMICAL PIPE SYSTEM

PART 1 - GENERAL

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Double walled PVC pipe and fittings
2. Fittings and accessories for double-walled pipe system.

B. Related Requirements:

1. Section 331300 “Disinfecting of Water Utility Distribution”: Disinfection requirements for potable-water systems.
2. Section 400506 “Couplings, Adapters, and Specials for Process Piping”: Pipe penetrations, restrained joints, flexible connections, expansion joints and loops, and sleeve-type couplings.
3. Section 400507 “Hangers and Supports for Process Piping”: Hangers, anchors, sleeves, and sealing of piping to adjacent structures.
4. Section 400531 “Thermoplastic Process Pipe”: piping materials, fittings, and appurtenances for single-walled pipe connections.
5. Section 400551 “Common Requirements for Process Valves”: Common product requirements for valves for placement by this Section.
6. Division 03 – Concrete.

1.3 COORDINATION

A. Coordinate Work of this Section with piping and equipment connections specified in other Sections and as indicated on Drawings.

1.4 ACTION SUBMITTALS

A. Product Data:

1. Manufacturer's catalog information regarding pipe, fittings, gaskets, piping appurtenances and leak detection system.
2. Chemical compatibility chart demonstrating proposed products, including delivery pipe, carrier pipe, fittings, gaskets and associated materials which could be exposed to the process chemical, are compatible with the listed process chemicals for the specified operating conditions including concentration, pressure, and temperature.
3. Manufacturer's catalog information regarding pipe hangers and supports, demonstrating compatibility with the proposed piping system.

B. Shop Drawings:

1. Indicate layout of piping systems, including equipment, critical dimensions, sizes, materials lists, location of all fittings, valves, in-line accessories, and wall-penetrations.
2. Identify slope, elevations of all floor and wall penetrations, location of high and low points, location of expansion loops or joints, drain ports, and flushing connections.
3. Identify location of all low point leak detection switches, visual inspection ports, leak detection wiring, conduit and cable.
4. Provide wiring diagram and example HMI screens for all automated electronic leak detection system panels.

1.5 DESIGNATED DESIGN SUBMITTALS

A. Delegated Design Submittals: Submit signed and sealed Shop Drawings with design calculations and assumptions for pipe sizes and sizing methods.

1.6 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificates: Certify that products meet or exceed specified requirements.

1. NSF-61, NSF-51, food grade certification

B. Manufacturer’s recommended butt fusion welding procedures identifying all quality control checks during the fusion procedure including the minimum and maximum allowable bead formation during the heat soak process and the final weld roll back process for the various size pipes.

C. Manufacturer to provide a sample joint for each size pipe to be supplied that is 12-inches long and has two heat fusion welds that identifies the manufacturer’s minimum and maximum allowable bead thicknesses. Provide documentation that the sample was pressure tested to 150 psi or the specified pressure.

D. Source Quality-Control Submittals: Indicate results of factory tests and inspections.

E. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

F. Qualifications Statements:

1. Submit qualifications for manufacturer, installer, and licensed professional.
2. Submit manufacturer's approval of installer.

1.7 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping, valves and other appurtenances, connections, and invert and centerline elevations.

B. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

© 2026 CDM Smith
All Rights Reserved

1.8 QUALITY ASSURANCE

A. All plastic pipe and fittings of each type shall be furnished by a single manufacturer who is experienced in the manufacture of the items to be furnished; however, it shall not be a requirement that the pipe and fittings be manufactured by the same manufacturer, provided that the pipe and fittings are compatible in both compounding and size.

B. Design, fabricate and install double containment piping to meet ASME/ANSI B31.3 where applicable manufacturer shall provide thermal stress analysis demonstrating the ability of the double-containment piping system to handle the stated piping conditions with a restrained or a flexible design, as follows:

1. Flexible Design: System shall be a flexible design with provisions to allow inner and outer pipe ability to move independent of one another. Anchors will be selectively used to direct thermal expansion into expansion loops, and/or offsets, etc. Manufacturer or Design Engineer should be consulted for the proper location of anchors and expansion compensation design.

C. Permanently mark each length of pipe with manufacturer's name or trademark and indicate conformance to standards.

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' documented experience.

B. Installer: Company specializing in performing Work of this Section with minimum five years' documented experience and certified or otherwise approved in writing by manufacturer.

C. Licensed Professional: Professional engineer experienced in design of specified Work and licensed in State of Florida.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Inspection:

1. Accept materials on Site in manufacturer's original packaging and inspect for damage.
2. Manufacturer's Packaging: Comply with ASTM D3892.

B. Storage: Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from puncture, abrasion, moisture, dust, and UV by storing in clean, dry location remote from construction operations areas.
2. Protect piping and appurtenances by storing off ground.
3. Provide additional protection according to manufacturer instructions.

© 2026 CDM Smith
All Rights Reserved

1.11 AMBIENT CONDITIONS

A. Comply with requirements for ambient condition control facilities for product storage and installation.

B. Minimum and Maximum Temperatures: Do not install pipe when temperature is below 40 degrees F or above 90 degrees F if pipe is exposed to direct sunlight.

C. UV Protection: Provide pipe installed above ground or outside with UV protection.

1.12 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

PART 2 - PRODUCTS

2.1 GENERAL

A. Applicability:

1. Requirements: Sodium Hypochlorite Chemical Piping System: Contractor to begin double wall chemical pipe system as specified herein on the outside of the existing secondary chemical containment area, as shown on Drawings.

a. For requirements regarding single-walled plastic pipe within the secondary containment area, refer to Section 400531 “Thermoplastic Process Pipe.”

B. Unit Responsibility:

1. Single Source: Provide materials manufactured by a single “DC Piping System Supplier”. DC Piping System Supplier shall have the sole responsibility for the proper manufacturing, shipping, delivery, assembly, testing, and shall assume proper functioning of all pipe, fittings, accessories, controls, and appurtenances.

C. System Description

1. The equipment and materials specified herein are intended to be standard types of plastic pipe and fittings for use in transporting wastewater, water, air, and chemicals.
2. Design components of the plastic piping systems shall be designed for the following conditions:

a. System: Sodium Hypochlorite (SH) and Sodium Bisulfite (SB)

1) Fluids:

a) 10 - 15 percent Sodium Hypochlorite

b) 35 – 40 percent Sodium Bisulfite

2) Carrier Pipe Diameter: 0.5 inch and 1-inch, as Shown on Drawings.
3) Containment Pipe Diameter: 2 inch and 3 inch, as Shown on Drawings.
4) Material: Double-Contained PVC
5) Pressure: Atmosphere to 150 psig
6) Temperature: 40 to 100 degrees F.
7) Special Conditions: Pulsation from hose pumps.

2.2 DOUBLE WALL PVC PIPE AND FITTINGS

A. General:

1. For all underground applications. Transition from single-walled CPVC as indicated on the Drawings.
2. Manufacturer:

   a. Asahi America; Pro-Lock.
   b. GF+; Double-See.
   c. Ipex; Guardian.
   d. Spears Manufacturing.

3. Materials:

   a. Delivery Pipe: sch 80 PVC.
   b. Containment Pipe: sch 80 PVC.

B. Description:

1. Pipe:

   a. Comply with ASTM D1785, Class 12454.
   b. Schedule: 80.

2. Fittings:

   a. Flanges: Comply with ASME B16.5; rated for a maximum 150 psig working pressure.
   b. Socket Type: Comply with ASTM D2467, Schedule 80.

3. Joints: Socket welded.
4. Materials:

   a. Comply with ASTM D1785.
   b. Minimum Cell Classification: 12454

2.3 ACCESSORIES

A. PVC and CPVC Piping:

1. General:

    a. Use of clear (fully transparent) sch 80 PVC piping on the double-containment piping system is allowed only at the low point drip legs and drain connection fittings.
    b. For all aboveground applications of single-walled CPVC or other plastic pipe, refer to Section 400531.

2. Flange Bolting:

    a. Hex-Head Bolts: Stainless steel; ASTM Grade 316.
    b. Hex-Head Nuts: Stainless steel; ASTM Grade 316.

3. Flange Gaskets:

    a. Type: Full faced.
    b. Material: EPDM.
    c. Comply with ASME B16.21.

4. Push-On Joint Seals:

    a. Material: EPDM
    b. Comply with ASTM F477.

5. Solvent Cement:

    a. Comply with ASTM D2564.
    b. Formulated for use with sodium hypochlorite and other caustic solutions.
    c. Pipe and fittings 12-inch diameter and smaller: IPS 711 Weld-on Cement or Approved Equal.
    d. Heavy bodied, medium setting.
    e. ASTM 2564, 100 percent solvent and PVC resin. No fillers permitted.
    f. Universal plastic pipe solvent is not acceptable.
    g. Must be formulated and compatible for use with 12.5 percent strength sodium hypochlorite.

6. Primer:

    a. Staining solvent conforming to standard ASTM F656.
    b. Manufactured by solvent weld cement manufacturer.

7. Fittings:

    a. Provide force-transfer type fittings at all locations where it is necessary to lock the inner and outer pipes of the DC piping system or where the DC piping connects to single-walled pipe.

        1) Provide solid Dogbone™, or Design-Builder-approved Equal at all terminations of the outer containment pipe and at all other connections to single-walled pipe.

2) Provide Dogbone™ seals or Design-Builder-approved Equal, type fittings on either side of in-line valves located on double-walled pipe.
3) Provide annular Dogbone™, or Design-Builder-approved Equal, type fittings to lock inner and outer pipes together on buried portions.
4) Provide restraint Dogbone™, or Design-Builder-approved Equal, type fittings at pipe hanger locations to withstand the thermal end-load.

b. Provide expansion loops every 100 LF or as recommended by manufacturer, whichever is greater.
c. Provide outer wall adapter fittings at all low points for leak detection and drainage of the exterior containment pipe. See detail on Drawings.
d. All fitting materials shall be sch 80 PVC, manufactured and supplied by the DC pipe system manufacturer.

8. Carrier Pipe Supports at Fittings:

a. Match Carrier Pipe materials for Secondary Containment Supports at Fittings.
b. Designed for field assembly of carrier pipe fittings in secondary containment fittings using self-centering, locking support clips.
c. Carrier pipe fittings and secondary containment pipe fittings anchored together using support clips.
d. Support clips consist of male by female, solvent weld, socket fittings with centering legs.
e. Support clips must permit uninterrupted drainage along the invert of the secondary containment pipe.

9. Carrier Pipe Support Clips:

a. Carrier pipe supports to support and center the carrier pipe inside the secondary containment pipe.
b. Carrier pipe supports must permit uninterrupted drainage along the invert of the secondary containment pipe.
c. Provide carrier pipe supports at intervals recommended by the double containment system manufacturer.

10. Wear pads:

a. Provide wear pads made of EPDM rubber (non-metallic, UV resistant material) for installation between plastic pipe and metal pipe supports to avoid direct contact between metal and plastic pipe..
b. Example products: Walraven Bismat 5000; Unistrut “Cush-a-Clamp”; Unistrut P2600; or Equal.

11. Pipe Supports:

a. Type 316 stainless steel compliant with ASTM A240.
b. Comply with other requirements as per Section 400507.

© 2026 CDM Smith
All Rights Reserved

2.4 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed pipe sections.

B. Owner Inspection:

1. Make completed pipe sections available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design and verify that new pipe and flange mate properly.

3.2 PREPARATION

A. Ream pipe and tube ends, remove burrs, and bevel plain-end pipe.

B. Thoroughly clean pipe and fittings before installation.

C. Cleaning: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. Comply with ASME B31.3 and B31.9.

B. Run piping straight along alignment as indicated on Shop Drawings, with minimum number of joints.

C. Fittings:

1. According to manufacturer instructions.
2. Gaskets:

a. Clean seats thoroughly.
b. Wipe gaskets clean prior to installation.

3. Tighten bolts progressively, drawing up bolts on opposite sides until bolts are uniformly tight; use torque wrench to tighten bolts to manufacturer instructions.

D. Provide required upstream and downstream clearances from devices as indicated.

E. Install piping with sufficient slopes for venting or drainage of liquids and condensate to low points.

F. Support exposed piping as specified in Section 400507 “Hangers and Supports for Process Piping.”

1. Double-walled pipe shall not be in direct contact with metal brackets.
2. Provide rubber or EPDM wear pad between metal pipe supports and pipe.

G. Install buried piping with bedding and backfill as specified in Section 312333. Blocking under pipe is not permitted.

H. Provide expansion joints as specified in Section 400506 “Couplings, Adapters, and Specials for Process Piping”, and provide pipe guides as specified in Section 400507 “Hangers and Supports for Process Piping”, to compensate for pipe expansion due to temperature differences.

I. Disinfection: Disinfect potable-water piping as specified in Section 331300 ‘Disinfecting of Water Utility Distribution.”

J. Field Cuts: According to pipe manufacturer instructions.

K. Joining:

1. Heat Joining: Comply with ASTM D2657.

a. Butt-fusion joints to be done by a factory-qualified joining technician as designated by the pipe manufacturer.
b. Field Samples: join two sample welds on each size of pipe to be installed using the same fusion welding equipment that will be used for completion of the entire work. These sample welds will be compared to the manufacturer’s sample previously submitted in accordance with Part 1.
c. Pipe joints with beads in excess of 3/16-in will not be approved by the Design-Builder.

2. Electrofusion: Comply with ASTM F1290.
3. Connect to different pipe materials by means of flanges, specified adapters, or transition fittings.

4. Solvent Cement Welded PVC and CPVC Pipe:

    a. Join by means of socket fittings and solvent cement welding in conformance with ASTM D2855 and ASTM F402.
    b. Make solvent-cement welded joints in strict compliance with the manufacturer's/supplier's instructions and recommended procedures.

5. Primers and Cleaners: Comply with ASTM F402.
6. PVC Solvent-Cemented Joints: Comply with ASTM D2855.

3.4 FIELD QUALITY CONTROL

A. Inspection:

1. Inspect for piping defects that may be detrimental as determined by the Design-Builder.
2. Inspect pipe supports to confirm wear pads are properly located.
3. Repair damaged piping, or provide new, undamaged pipe.
4. After installation, inspect for proper supports and interferences.

B. Clean Water Pressure Testing:

1. Sequence:

    a. Conduct preliminary pressure tests of piping segments with clean potable water prior to burying pipe (outdoor segments) or making final connections. Test segment length not to exceed 200LF.
    b. Conduct system pressure tests for fully installed system – including pump suction piping to discharge point and associated single-walled pipe - with clean potable water prior to testing with applicable process chemical.

2. Test Pressure: Not less than 150 psig or 1.5 times the system’s working pressure, whichever is greater.
3. Conduct hydrostatic test for minimum two hours with clean potable water.
4. Filling:

    a. Fill section to be tested with water slowly and expel air from piping at high points.
    b. Install corporation cocks at high points.
    c. Close air vents and corporation cocks after air is expelled.
    d. Raise pressure to specified test pressure.

5. Observe joints, fittings, and valves under test.
6. Remove and renew cracked pipe, joints, fittings, and valves showing visible leakage and retest.
7. Leakage:

    a. Correct visible deficiencies and continue testing at same test pressure for additional two hours to determine leakage rate.
    b. Maintain pressure within plus or minus 5 psiof test pressure.
    c. Leakage is defined as quantity of water supplied to piping necessary to maintain test pressure during period of test.

d. Correct visible leaks and repeat test to verify no leaks at the required test pressures.

8. Repeat clear water hydrostatic test for fully-installed piping system – including both single-walled and double-walled piping located from the pump discharge to injection point.
9. Conduct a field check of the operating pressures measured during clean water testing:

    a. Adjust system valving to normal positions for standard operation and adjust PRVs and PCVs to pressure setpoints set forth in these Contract Documents.
    b. Run chemical feed pumps one at a time on clean water and measure operating pressures for each fully-installed chemical delivery pipe (includes single-walled pipe on either end of the double-walled pipe). Compare to setpoints.
    c. Report results to Design-Builder via submittal. Confirm operating pressure setpoints for PRVs and PCVs with Design-Builder prior to start-up testing.

C. Secondary Containment Pneumatic Testing:

1. Medium: Instrument Grade Air or Nitrogen.
2. Test Pressure: 5 psig maximum.
3. Duration: 2 hours.
4. Maximum Allowable Pressure Drop: 0.1 psig over 2 hours.
5. Maintain 10 psig, minimum, in primary containment pipe during testing of secondary containment pipe.
6. Test Safety: As specified in Section 40 05 01 for Pneumatic Pressure Testing.
7. Conform to double containment pipe system manufacturer's compressed gas testing procedures.

D. Process Chemical Start-up Testing:

1. Sequence: After demonstrating no leakage of process piping, and measured operating pressures during the clean water pressure test, proceed to test the fully installed chemical delivery piping system with the applicable process chemical to confirm no leakage.
2. Flush piping with clean potable water and expel air from high points. Close air vents and corporation cocks after air is expelled prior to initiating pumping of process chemicals.
3. Confirm all drain valves and flushing connections are fully closed.
4. Test pressure shall be 80 psi as measured at the pump discharge or 100 psig the system's measured working pressure (from the clean water test), whichever is greater. Adjust PRV setpoints at injection points to achieve target test pressure.
5. Conduct test for minimum two hours with applicable process chemical.
6. Filling:

    a. Chemical delivery pipelines should be full of potable water at the start of this test.
    b. Initiate pumping of appropriate process chemical. Confirm process chemical is being discharged at injection point prior to starting test duration.

7. Observe joints, fittings, and valves under test.
8. If leakage is noted, stop test. Remove and renew cracked pipe, joints, fittings, and valves showing visible leakage and retest.
9. Unless testing results indicate otherwise, restore PRV and PCV pressure setpoints to those specified in Contract Documents upon the conclusion of field testing.

© 2026 CDM Smith
All Rights Reserved

10. The Owner will furnish up to 800 gallons of each chemical to Contractor for the purpose of field testing. Contractor is responsible to reimburse Owner for additional quantities.

3.5 CLEANING

A. Keep pipe interior clean as installation progresses.

B. Clean pipe interior of soil, grit, shavings, and other debris after pipe installation.

END OF SECTION 400532

© 2026 CDM Smith
All Rights Reserved

SECTION 400551 - COMMON REQUIREMENTS FOR PROCESS VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Common requirements for valves.
2. Common requirements for valve actuators.
3. Valve tags.
4. Valve Schedule.

B. Related Requirements:

1. Section 055000 “Metal Fabrications” for miscellaneous metalwork and fasteners specified by this Section.
2. Section 220523 “General-Duty Valves for Plumbing Piping” for miscellaneous plumbing valves as required by Project.
3. Section 330110.58 “Disinfection of Water Utility Piping Systems.”
4. Section 400507 “Hangers and Supports for Process Piping” for product and execution requirements for valve supports specified by this Section.
5. Section 400548 “Vibration and Seismic Controls for Process Piping” for product and execution requirements for vibration and seismic control specified by this Section.
6. Section 400557 “Actuators for Process Valves and Gates.”

1.3 COORDINATION

A. Coordinate Work of this Section with individual process valve specifications.

1.4 PREINSTALLATION MEETINGS

A. Convene minimum one week prior to commencing Work of this Section.

1.5 ACTION SUBMITTALS

A. Valve Schedule:

1. Submit valve schedule populated with all Division 40 process valves specified for this project. Include all information shown on the Sample Valve Schedule included in this project.
2. Approval of valve schedule submittal to precede all individual valve submittals. All subsequent individual valve submittals to include the approved valve tag number or group on the submittal cover sheet.

B. Valve Tags:

1. Materials, dimensions and thickness of tags, materials and gauge of cable and splicing hardware.
2. The color palette for Owner selection.
3. Full scale drawing of sample with lettering dimensions and scribe depth.
4. Valve tag lettering provided with Valve Schedule above.

C. Power Actuator Data:

1. Sizing calculations

   a. Provide fluid pressure and velocity sizing basis.
   b. Provide maximum valve torque based on disc shape and flow direction.
   c. Clearly indicate safety factors and mechanical ratios of any intermediate gearing.

2. Maximum output torque of actuator and intermediate gearing.
3. Details of actuator mounting, including orientation of actuator and intermediate gearing.
4. Dimensional drawing of actuator assembled on valve.
5. Pneumatic/Hydraulic pressure requirements, electrical power supply, plumbing connection sizes and locations.
6. Wiring diagram, control wiring and protocol.
7. Valve cavitation limits for positioning, modulating and control valves mated to power actuator.

D. Shop Drawings: Valve and actuator model number and size, valve parts list, materials of each part including material standard designation (ASTM or other), position indicators, limit switches, actuator mounting.

E. Provide certified hydrostatic test data, per manufacturer's standard procedure or MSS-SP-61 for all valves.

1.6 DELEGATED DESIGN SUBMITTALS

A. Submit signed and sealed Shop Drawings with design calculations and assumptions for sizing of control valves.

1.7 INFORMATIONAL SUBMITTALS

A. Manufacturer Instructions: Submit installation and operation instructions for each component including valve, actuator, gearbox, and any included instrumentation.

B. Source Quality-Control Submittals: Indicate results of integrators facility tests and manufacturers factory tests and inspections.

C. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

D. Manufacturer Certification of Installation: Certify that equipment has been installed according to manufacturer instructions.

E. Qualifications Statement:

1. Submit qualifications for manufacturer and licensed professional.

1.8 QUALITY ASSURANCE

A. Maintain clearances as indicated on Drawings.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

C. Mate valves to actuators at manufacturer's or integrator's facility. Fully test assembled product and certify ready for installation prior to shipment to the job site.

1. Only in special cases for extremely large assemblies where installation requires disassembly, may actuators be mounted to the valves in the field.

D. Materials in Contact with Potable Water: Certified to NSF 61 and NSF 372.

E. Furnish affidavit of compliance with testing and manufacturing standards referred in this specification and the individual valve specifications.

F. Provide the services of a qualified and factory-trained service representative of the manufacturer to provide installation inspection and check out, and operational and maintenance instruction, for each type of the following equipment for the following durations:

Equipment	Valve Sizes	Installation Inspection	O and M Instruction
480 volt electric actuators	N/A	1 day	1 day
230 volt electro-hydraulic actuators	N/A	1 day	1 day
Pressure regulating valves	10-in and up	1 day	1 day
Gate valves	12-in and up	1 day	1 day
Knife gate valves	12-in and up	1 day	1 day
Surge relief valves	10-in and up	1 day	1 day
Cone valves	12-in and up	1 day	1 day
Combination Air Valves	4-in and up	1 day	1 day
Vacuum Breaker/Air Release Valves	2-in and up	1 day	1 day

G. Obtain Manufacturer's Certification of Proper Installation for Specified valves and valve assemblies.

H. Perform Work according to State of New York standards.

I. Maintain 1 copy of each standard affecting Work of this Section on Site.

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing valves and actuators with minimum ten years' documented experience.

B. Licensed Professional: Professional engineer experienced in design of specified Work and licensed in the State of New York.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Deliver factory mated power actuated valves on rigid wooden skids, fully braced and strapped to prevent damage to valve, actuator or coupling system.

C. Store materials according to manufacturer instructions.

D. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Protect valve ends from entry of foreign materials by providing temporary covers and plugs.
3. Provide additional protection according to manufacturer instructions.

1.11 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to materials ordering or any fabrication.
2. Indicate field measurements on Shop Drawings.

1.12 WARRANTY

A. Furnish one-year manufacturer's warranty for valves and actuators.

PART 2 - PRODUCTS

2.1 VALVES

A. Description: Valves, operator, actuator, handwheel, chainwheel, extension stem, floor stand, worm and gear operator, operating nut, chain, wrench, and other accessories as required.

B. Provide all valves of the same type by same manufacturer

C. Valve Ends: Compatible with adjacent piping system and as indicated on valve schedule.

D. Operation:

1. Close by turning clockwise.
2. Cast directional arrow on valve or actuator with OPEN and CLOSE cast on valve in appropriate location.

E. Valve Marking and Labeling:

1. Marking: Comply with MSS SP-25.
2. As indicated in valve schedule.
3. Labeling (valve tags):

a. Fiberglass reinforced plastic, ASTM D709, 70 mil thick, 2 1/2-inch diameter or 2 1/2-inch by 1 ¼-inch.
b. Lettering 1/16-inch thick of silk screening or other permanent embedment of subsurface printed graphics, permanently sealed.
c. Colors of lettering and backing as selected by Owner.
d. Two, 1/4-inch clear opening 316 stainless steel grommets at each end, center of hole 3/8-inch from tag edge.
e. 3/32-inch 316 SS cable and splice hardware.

F. Valve Construction: As Specified in Valve Sections.

G. Do not use Van Stone flanges with pinch valves, industrial butterfly valves; elastomer bellows style expansion joints or other piping system components having an elastomer liner (rubber seat) that is used as a gasket.

2.2 VALVE ACTUATORS

A. Provide actuators in accordance with the valve schedule included on the Drawings.

B. Provide mechanical position indicators for power actuated and gearbox actuated valves.

C. Comply with AWWA C541 (Pneumatic and Hydraulic actuators) and C542 (Electric Motor Actuators) as applicable.

D. Provide chain actuators for shutoff valves mounted greater than 7 feetabove operating floor level.

E. Gear and Power actuators as specified in Section 400557.00 “Actuators for Process Valves and Gates”.

2.3 INSULATION

A. As indicated in pipe schedule.

2.4 FINISHES

A. Valve Coating: Comply with AWWA C550.

B. Factory finishes are included in individual valve sections.

C. Stainless Body Valves: Do not coat.

D. Do not coat flange faces of valves unless otherwise specified.

2.5 SOURCE QUALITY CONTROL

A. Testing: Test valves according to manufacturer's standard testing protocol, including hydrostatic, seal, and performance testing.

B. Owner Inspection:

1. Make completed valve manufacture available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that piping system is ready for valve installation.

B. Fully examine valves for debris, damage and interior finish blemishes prior to installation. Do not install valves with soiled interior or any visible damage to seats, discs or interior finish.

C. Identify any piping, plant or equipment clearance issues prior to installation, bring to Engineer’s attention via job meetings, submittal process or request for information process.

© 2026 CDM Smith
All Rights Reserved

3.2 INSTALLATION

A. Install valves, actuators, extensions, valve boxes, and accessories according to manufacturer instructions.

B. Inspect valve interiors before line closure for the presence of debris. At the option of the Engineer, internal inspection of valve and appurtenances may be required any time that the likelihood of debris is a possibility. Clean connecting pipes prior to installation, testing, disinfection and final acceptance.

C. Disinfect valves installed in potable water lines with approved pipeline disinfection process.

D. Rigidly support valves to avoid stresses on piping.

E. Coat studs, bolts and nuts with anti-seizing lubricant.

F. Dielectric Fittings: Provide between dissimilar metals.

G. Clean field welds of slag and splatter to provide a smooth surface.

H. Mate, adjust and fully test gearboxes, electric, hydraulic and pneumatic actuators to valves at manufacturer's or integrator's facility.

1. Only in special cases for extremely large assemblies where installation requires disassembly may actuators be mounted to the valves in the field. These circumstances require preinstallation meetings.

I. Do not install stems vertically downward.

J. Unless otherwise indicated on the Drawings:

1. Install Gate, Globe, Ball valves with stem vertical in the 12 o'clock position.
2. Install Plug valves with stem horizontal and plug opening to the top of the body unless position will not allow proper actuator access, in which case stem may be vertical in the 12 o'clock position.
3. Install Butterfly valves 12 inch and smaller with stem horizontal or vertical in the 12 o'clock position,
4. Install Butterfly valves 14 inch and larger with the stem horizontal unless position will not allow proper actuator access, in which case stem may be vertical in the 12 o'clock position.
5. Install Control valves in horizontal pipelines with top works vertically upward.

K. Install all brackets, extension rods, guides, the various types of operators and appurtenances as indicated. Before properly setting these items, check all drawings and figures which have a direct bearing on their location.

L. Inspect all materials for defects in construction and materials. Clean debris and foreign material out of openings, etc. Verify valve flange covers remain in place until connected piping is in place. Verify operability of all operating mechanisms for proper functioning. Check all nuts and bolts for tightness. Repaired or replace valves and other equipment which do not operate easily or are otherwise defective.

M. Where installation is covered by a referenced standard, install and certify in accordance with that standard, except as herein modified. Also note additional requirements in other parts of this Section.

N. Unless otherwise noted, provide joints for valves and appurtenances utilizing the same procedures as specified under the applicable type connecting pipe joint. Install valves and other items as recommended by the manufacturer. Verify manufacturers' torqueing requirements for all valves.

O. Coordinate direction of flow through offset type and shaped butterfly valve discs with the mated actuator torque capacity.

P. Rotate valve operators and indicators to display toward normal operation locations. Consult with Engineer prior to installing valves with handwheels to confirm final position of handwheel.

Q. Vertically center floor boxes, valve boxes, extension stems, and low floor stands over the operating nut, with couplings as required.

1. Adjust elevation of the box top to conform to the elevation of the finished floor surface or grade at the completion of the Contract.
2. Support boxes and stem guides during concrete placement to maintain vertical alignment.

R. Install brass male adapters on each side of valves in copper-piped system and solder adapters to pipe.

S. Install 1-inch gate valves with cap for drains at main shutoff valves, low points of piping, bases of vertical risers, and equipment.

T. Install valves with clearance for installation of insulation and to allow access.

U. Provide access where valves and fittings are not accessible.

V. Pipe Hangers and Supports: As specified in Section 400507 “Hangers and Supports for Process Piping”.

W. Comply with Division 40 - Process Interconnections for piping materials applying to various system types.

X. Install insulation as indicated in pipe schedule.

3.3 FIELD QUALITY CONTROL

A. Valve Field Testing:

1. Test for proper alignment.
2. If specified by valve Section, field test equipment to demonstrate operation without undue noise, vibration, or overheating.
3. Engineer will witness field testing.
4. Functional Test:

a. Prior to system startup, inspect valves and actuators for proper alignment, quiet operation, proper connection and satisfactory performance.
b. After installation, open and close all manual valves in the presence of the Engineer to show the valve operates smoothly from full open to full close and without leakage.
c. Cycle valves equipped with electric, pneumatic or hydraulic actuators 5 times from full open to full closed in the presence of the Engineer to exhibit operation without vibration, jamming, leakage, or overheating.
d. Operate pressure control and pressure relief valves in the presence of the Engineer to show they perform their specified function at some time prior to placing the piping system in operation and as agreed during construction coordination meetings.

5. Field test pipe lines in which the valves and appurtenances are to be installed. During these tests, adjust, remove or replace defective valve or appurtenance, or otherwise make acceptable to the Engineer. Test regulating valves, strainers, or other appurtenances to demonstrate conformance with the specified operational capabilities. Correct deficiencies, replace device or otherwise made acceptable to the Engineer.

SECTION 400553 - IDENTIFICATION FOR PROCESS PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Nameplates.
2. Tags.
3. Stencils.
4. Pipe markers.
5. Ceiling tacks.
6. Labels.
7. Lockout devices.

B. Related Requirements:

1. Section 400551 “Common Requirements for Process Valves”: Basic materials and methods for valves.

1.3 PREINSTALLATION MEETINGS

A. Convene minimum one week prior to commencing Work of this Section.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's catalog literature for each specified product.

B. Shop Drawings:

1. Indicate list of wording, symbols, letter size, spacing of labels, and color-coding for mechanical identification and valve chart and schedule.
2. Indicate valve tag number, location, function, and valve manufacturer's name and model number.

C. Samples: Submit two tags for each size to be used on Project.

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

E. Manufacturer Instructions: Submit detailed instructions on installation requirements, including storage and handling procedures.

F. Qualifications Statement:

1. Submit qualifications for manufacturer.

1.5 SUSTAINABLE DESIGN SUBMITTALS

A. Manufacturer's Certificate:

1. Certify that products meet or exceed specified sustainable design requirements.
2. Materials Resources Certificates:

a. Certify source and origin for salvaged and reused products.
b. Certify recycled material content for recycled content products.
c. Certify source for regional materials and distance from Project Site.

B. Product Cost Data:

1. Submit cost of products to verify compliance with Project sustainable design requirements.
2. Exclude cost of labor and equipment to install products.
3. Provide cost data for following products:

a. Salvaged, refurbished, and reused products.
b. Products with recycled material content.
c. Regional products.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of tagged valves; include valve tag numbers.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Extra Stock Materials: Furnish two containers of spray-on adhesive.

B. Tools: Furnish special crimpers and other devices required for Owner to reinstall tags.

1.8 QUALITY ASSURANCE

A. Piping Color Scheme and Lettering Size: Comply with ASME A13.1.

B. Perform Work according to State of New York standards.

C. Comply with recommended water treatment plant color coding from the latest version of Ten State Standards unless otherwise requested by Owner.

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' documented experience.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Provide additional protection according to manufacturer instructions.

PART 2 - PRODUCTS

2.1 NAMEPLATES

A. Manufacturers:

1. Craftmark Pipe Markers.
2. Kolbi Pipe Marker Co.
3. Pipemarker.com (Brimar Industries, inc.),
4. Seton Identification Products.

B. Description: Laminated three-layer plastic with engraved black letters on light, contrasting background color.

2.2 TAGS

A. Plastic Tags:

1. Manufacturers:

a. Brady ID.
b. Craftmark Pipe Markers.
c. Kolbi Pipe Marker Co.
d. Marking Services, Inc.
e. R&R Identification Co.
f. Seton Identification Products.

2. Description:

a. Laminated three-layer plastic with engraved black letters on light, contrasting background color.
b. Minimum Tag Size and Configuration: 2 inches; diameter.
c. Provide with brass hooks suitable for attaching the tag to the valve operator.
d. Stamp or etch tags with the valve number and information on the valve schedule coded in a system provided by the Owner.

B. Metal Tags:

1. Manufacturers:

a. Brady ID.
b. Craftmark Pipe Markers.
c. Kolbi Pipe Marker Co.
d. Marking Services, Inc.
e. Pipemarker.com (Brimar Industries, Inc.).
f. R&R Identification Co.
g. Seton Identification Products.

2. Description:

a. Stainless-steel construction; stamped letters.
b. Minimum Tag Size and Configuration: 2 inches; diameter with finished edges.
c. Provide with brass hooks suitable for attaching the tag to the valve operator.
d. Stamp or etch tags with the valve number and information on the valve schedule coded in a system provided by the Owner.

C. Information Tags:

1. Manufacturers:

a. Brady ID.
b. Seton Identification Products.

2. Description:

a. Clear plastic with printed text DANGER and message consisting of material information.
b. Minimum Tag Size: 3-1/4 by 5-5/8 inches.
c. Furnish grommet and self-locking nylon ties.

3. Tag Chart: Typewritten, letter-size list of applied tags and location, plastic laminated.

2.3 STENCILS

A. Manufacturers:

1. Kolbi Pipe Marker Co.
2. Marking Services, Inc.
3. Pipemarker.com (Brimar Industries, Inc.),

4. R&R Identification Co.
5. Seton Identification Products.

B. Description:

1. Quality: Clean-cut symbols.
2. Letters:

OUTSIDE DIAMETER OF PIPE	SIZE OF LETTERS
3/4-in to 1-1/4-inch	1/2-inch
1-1/2-in to 2-inch	3/4-inch
2-1/2-in to 6-inch	1-1/2-inch
8-in to 10-inch	2-1/2-inch
Over 10-inch	3-inch

C. Stencil Paint:

1. Description: Manufacturer's standard.

2.4 PIPE MARKERS

A. Plastic Pipe Markers:

1. Manufacturers:

a. Brady ID.
b. Craftmark Pipe Markers.
c. Marking Services, Inc.
d. R&R Identification Co.
e. Seton Identification Products.

2. Description:

a. Factory-fabricated, flexible, and semi-rigid plastic.
b. Preformed to fit around pipe or pipe covering.
c. Larger sizes may be of maximum sheet size, with spring fastener.
d. Letter sizes per Paragraph 2.3B.
e. Color shall be white or black depending on background color.

B. Plastic Tape Pipe Markers:

1. Manufacturers:

a. Brady ID.
b. Craftmark Pipe Markers.
c. Kolbi Pipe Marker Co.
d. Marking Services, Inc.
e. Pipemarker.com (Brimar Industries, Inc.).

f. Seton Identification Products.

2. Description:

a. Flexible, 3.5 mil vinyl film tape with pressure-sensitive adhesive backing and printed markings.
b. Letter sizes per Paragraph 2.3B.
c. Color shall be white or black depending on background color.

C. Plastic Underground Pipe Markers:

1. Manufacturers:

a. Kolbi Pipe Marker Co.
b. Marking Services, Inc.
c. Pipemarker.com (Brimar Industries, Inc.).
d. Rhino Marking and Protection System.
e. Seton Identification Products.

2. Description:

a. Brightly colored, continuously printed plastic ribbon tape.
b. Minimum Size: 6 inches wide by 4 mils thick.
c. Manufactured for direct burial service.
d. Letter sizes per Paragraph 2.3B.

2.5 CEILING TACKS

A. Manufacturers:

1. Marking Services, Inc.
2. R&R Identification Co.
3. Seton Identification Products.

B. Description:

1. Material: Steel.
2. Head:

a. Color-coded.
b. Diameter: 3/4 inch.

2.6 LABELS

A. Manufacturers:

1. Brady ID.
2. Seton Identification Products.

B. Description:

1. Material: Aluminum.
2. Minimum Size: 1.9 by 0.75 inches.
3. Adhesive backed, with printed identification and bar code.

2.7 LOCKOUT DEVICES

A. Lockout Hasps:

1. Manufacturers:

a. Brady ID.
b. Master Lock Company, LLC.

2. Description:

a. Material: Anodized aluminum.
b. Furnish hasp with erasable label surface.
c. Minimum Size: 7-1/4 by 3 inches.

B. Valve Lockout Devices:

1. Manufacturers:

a. Brady ID.
b. Master Lock Company, LLC.

2. Description:

a. Material: Plastic.
b. Furnish device to restrict access to valve operator and to accept lock shackle.

PART 3 - EXECUTION

3.1 PREPARATION

A. Degrease and clean surfaces to receive adhesive for identification materials.

B. Stencil Painting: Prepare surfaces as specified in Section Manufacturer’s standard.

3.2 INSTALLATION

A. According to manufacturer instructions.

B. Apply stencil painting as specified in Section Manufacturer’s standard.

C. Install identifying devices after completion of coverings and painting.

D. Install plastic nameplates with corrosion-resistant mechanical fasteners or adhesive.

E. Labels:

1. Install labels with sufficient adhesive for permanent adhesion and seal with clear lacquer.
2. For unfinished covering, apply paint primer before applying labels.
3. Titles:

   a. Locate a maximum 26 feet apart.
   b. Locate directly adjacent to pipeline breaches on each side wall.
   c. Locate adjacent to each side of the valve regulator, flow meter, strainer, cleanout and all pieces of equipment.
   d. Identify the contents by complete name at least once in each room or space and thereafter may be labeled by generally recognized abbreviations.

F. Tags:

1. Identify valves in main and branch piping with tags.
2. Install tags using corrosion-resistant chain.
3. Number tags consecutively by location.

G. Install underground plastic pipe markers 6 to 8 inches below finished grade, directly above buried pipe.

H. Piping:

1. Identify piping, concealed or exposed, with plastic pipe markers.
2. Identify service, flow direction, and pressure.
3. Install in clear view and align with axis of piping.
4. Locate identification not to exceed 20 feet on straight runs, including risers and drops, adjacent to each valve and tee, at each side of penetration of structure or enclosure, and at each obstruction.

I. Ceiling Tacks:

1. Provide ceiling tacks to locate valves above T-bar-type panel ceilings.
2. Locate in corner of ceiling panel closest to equipment.

SECTION 400557 - ACTUATORS FOR PROCESS VALVES AND GATES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Following types of actuators for linear, multi-turn, and quarter turn valves and gates:

1. Manual actuators.
2. Electric motor actuators.

B. Related Requirements:

1. Section 055000 “Metal Fabrications” for miscellaneous metalwork and fasteners as required.
2. Section 400507 “Hangers and Supports for Process Piping” for hangers, anchors, sleeves, and sealing of piping to adjacent structures.
3. Section 400551 “Common Requirements for Process Valves” for common product requirements for valves for placement by this Section.

1.3 DEFINITION

A. Where the term “valve” alone is used in this Section, it applies to both valves and gates as the corresponding text context dictates.

1.4 COORDINATION

A. Section 400551 “Common Requirements for Process Valves” for valve schedule requirements.

B. Coordinate Work of this Section with installation of valves, gates, and accessories.

1.5 PREINSTALLATION MEETINGS

A. Convene minimum one week at site prior to commencing Work of this Section.

1.6 SUBMITTALS

A. Product Data: Manufacturer information for actuator with model number and size indicated.

B. Shop Drawings:

1. Parts list, materials, sizes, position indicators, limit switches, actuator mounting, wiring diagrams, control system schematics with external interfaces on assembly drawings.
2. Actuator Shop Drawings with respective valve and gate submittal.

C. Manufacturer's Certificate: Products meet or exceed specified requirements.

D. Manufacturer Instructions: Special procedures and placement requirements.

E. Source Quality-Control Submittals: Results of factory tests and inspections and provide required certifications.

F. Field Quality-Control Submittals: Results of Contractor-furnished tests and inspections.

G. Qualifications Statements:

1. Qualifications for manufacturer and installer.
2. Manufacturer's approval of installer.

1.7 CLOSEOUT SUBMITTALS

A. Project Record Documents: Documentation of actual locations and types of actuators.

1.8 QUALITY ASSURANCE

A. Valve Actuators in NEC Locations: Comply with NFPA 70.

B. Minimum NEMA Enclosure Classification:

1. Non-submergence Installations: NEMA 4X.
2. Submergence Installations: NEMA 6P/IP68.

C. Perform Work according to State of New York Department of Transportation standards.

D. Maintain a copy of each standard affecting Work of this Section on Site.

E. Single Source Requirements:

1. Furnish electric motor actuators in the scope of the project by the same manufacturer. Coordinate this requirement with actuated valves and gates included in scope of vender furnished equipment.
2. Furnish actuators, floor stands, stem guides, stems, extensions, and accessories for slide gate assemblies by slide gate manufacturer.

F. Mate actuators to equipment at equipment manufacturers or integrators facility.

1. Test assembled product. Certify ready for installation prior to shipment to job site.
2. For extremely large assemblies requiring disassembly for installation, the actuator may be disassembled for shipment and remounted in the field.

© 2026 CDM Smith
All Rights Reserved

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' experience.

B. Installer: Company specializing in performing Work of this Section with minimum five years' experience.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Furnish temporary end caps and closures on piping and fittings and maintain in place until installation.
3. Provide additional protection according to manufacturer instructions.

1.11 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.12 WARRANTY

A. Manufacturer’s Special Warranty: Submit standard written warranty against manufacturing defects for manual and electric-motor actuators.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL

A. Refer to valve and gate schedule for actuator type, accessories, and sizing information.

B. Provide clockwise closed actuation unless otherwise noted on the valve and gate schedule.

C. Supply chain actuators for manual valves located 7 feet or higher above finished floor.

© 2026 CDM Smith
All Rights Reserved

2.2 ACCESSORIES

A. Floor Stands:

1. Materials:

a. Stand: Cast iron or fabricated steel**.**
b. Stem Bushing: Sintered bronze.
c. Position Indicator: Bronze.

2. Height to input shaft or handwheel: 32 inch.
3. Base Mounting Requirements:

a. Concrete Floor Mounting: Type 316 stainless-steel anchor bolts.
b. Face of Basin or Offset Mounting: Heavily reinforced, adjustable wall bracket with required anchor hardware using Type 316 stainless steel.

4. Actuator Mounting Requirements:

a. Manual Actuator: Cast iron handwheel on top of floor stand with dual ball type thrust bearings, grease fitting on bearing bowl, hardened machined alloy bronze lift nut (for rising stem). Where manual effort is greater than 40 lb rim pull with 2 feet diameter wheel, provide geared actuator with a handwheel or crank.

1) Handwheel casting to include the word “OPEN” and an arrow indicating the direction of operation.

b. Gearbox or Direct Powered Actuator: Through bolt holes matched to actuator or gearbox bolting pattern.

5. Non-rising stem position indicator: Mechanical indicator connected to and driven by stem extension and cast position marks on floor stand with the word “OPEN” cast at the top of the travel, and a field mounted aluminum “CLOSED” tag supplied with drive rivets, installed based on number of valve turns.
6. Rising Stem Position Indicator: Permanent markings on transparent stem covers.

B. Stem Covers: Fracture-resistant clear polycarbonate stem covers for rising stems. Closed top with position indicator markings.

C. Extension Stems and Stem Guides:

1. Extension stems and couplings to actuate recessed, buried, below slab valves and gates via operating nut or floor stand mounted actuator.
2. Stem Extensions and Stem Couplings: Alloy steel, hardware of Type 316 stainless steel unless specified otherwise in the respective slide gate specification.
3. Stem and Stem Couplings: Rated for five times the maximum input torque capacity of the actuator.
4. Adjustable, Cast Iron Wall Bracket Type Stem Guides: Include bronze bushing.
5. Spacing: 10 feet spacing or at spacing calculated by manufacturer to prevent buckling with a safety factor of 2 based on design thrust, shaft material and shaft size.

D. Torque Tubes:

1. Supply where shown on the Drawings or Valve and Gate Schedule.
2. Supported by/mated to valve bonnet/yoke.
3. Sized by supplier for the required actuator torque.
4. Drilled specifically for valve and actuator bolt pattern.
5. Internal extension keyed or shaped specifically to mate to valve shaft and fabricated of Type 316 stainless steel.
6. Internal extension designed for axial adjustment for mating purposes.

2.3 MANUAL ACTUATORS

A. Operating Nuts:

1. 2 inch cast iron AWWA design.

   a. Painted Carbon Steel Tee Handle Operator: 2 inch AWWA nut socket end extension length for nut actuated valves where nuts are recessed in valve boxes.
   b. Tee Extension Length: Determine based on nut height as shown on Drawings with handle height approximately 3 feet above operating surface.

2. Operating Nuts Recessed on Concrete: Cast iron floor box with cover and tee handle operator with 2 inch AWWA nut socket end.
3. Nut Operated Non-Rising Stem Buried Valves: Cast iron bonnet skirts, extension pipes valve box and cover. Stem extensions with AWWA nut end to elevation shown on the Drawings or scheduled.
4. Lever type handle on manually operated 4-in and 6-in diameter ductile iron body ball valves and 4-in eccentric plug valves and smaller.

B. Manual Handwheel Actuators:

1. Comply with AWWA C504.
2. Provide manual handwheels actuators for 16-in diameter resilient gate valves and smaller.
3. Provide manual handwheel actuators for knife gate valves 16-in and smaller.
4. Maximum Handwheel Pull: 40 lbs.
5. Handwheel Material: Cast of ductile iron.
6. Handwheel Diameter for Gate Valves Sizes:

   a. For 6-in Valve: 12”
   b. For 8-in Valve: 14”
   c. For 10-in Valve: 16”
   d. For 12-in Valve: 18”
   e. For 14-in Valve: 20”
   f. For 16-in Valve: 22”

7. Handwheel Diameter for Knife Gate Valves:

   a. For 6-in thru 10-in Valves: 16”
   b. For 12-in thru 16-in Valves: 20”

C. Gear-Assisted Manual Valve Actuators:

1. Comply with AWWA C504.
2. Provide gear assisted manual valve actuators for plug valves 6-in and larger.
3. Provide gear assisted manual valve actuators for knife gate valves 18-in and larger.
4. Maximum Handwheel Pull: 40 lbs.
5. Handwheel Material: Cast or ductile iron.
6. Handwheel Diameter for Knife Gate Valves:

    a. For 18-in thru 24-in Valves: 12”

7. Housings: Cast or ductile iron.
8. Worm or helical gear type.
9. Gears: Hardened steel, machine cut and mated.
10. Bearings: Permanently lubricated bronze.
11. Input and Output Shafts: Sealed with greased, waterproof machine shaft seals.
12. Filled with waterproof grease and designed for submerged service where scheduled.

D. Chain Wheels:

1. Supply for manual valves 3 inch diameter or larger mounted 7 feet and greater above operating floor level.
2. Type: Sprocket rim with chain and floating chain guide.
3. Chain Wheel and Guides Materials: Cast iron with hot-dip galvanized chain.
4. Chain Length: Extend to5-1/2 feet above operating floor level.
5. Chain Storage: Include where chains may interfere with personnel egress, made with high-strength thermoplastic polymer in safety orange color.

    a. Basis-of-Design: Trumbull, Model ‘Chain Up’ as manufactured by Trumbull Manufacturing. Inc., or equal.

6. Chain Wall Hooks: Include where feasible to prevent chain from impeding personnel egress.

E. Direct Manual Slide Gate Actuators:

1. Small Gates not Requiring Gear Reduction to Achieve Rim Pull Requirements: Yoke or floor stand mounted handwheel with dual ball type thrust bearings, grease fitting on bearing bowl, hardened machined alloy bronze lift nut.

F. Gear-Assisted Manual Slide Gate Actuators:

1. Provide manually actuated slide gates where direct mount actuators cannot meet rim pull requirements and design safety factors.
2. Include power actuators where torque requirements dictate.
3. Comply with AWWA C504.
4. Yoke mount for self-contained gates and floor stand mount for non-self-contained gates.
5. Accessories specified hereinabove where pertinent to the application.
6. Handwheel or crank style operator with maximum rim or crank pull of 40 lbs

    a. Crank operators of cast iron construction with revolving brass grip.

b. Handwheel casting to include the word “OPEN” and an arrow indicating the direction of operation.

7. Gear Boxes:

a. Bevel or parallel shaft as required by installation geometry.
b. Fully enclosed cast or ductile iron housings.
c. Suitable for pedestal or yoke (bench) mounting.
d. Mechanical seals on input shafting.
e. Shafting fully supported with anti-friction ball or roller bearings throughout.
f. Precision machined high strength bronze lift nuts.
g. Precision cut steel gears.
h. Input Shafts: Type 316 stainless steel.
i. AWWA drive nut for removable crank, wheel or portable power operator to be 2 inches
j. Single or compound reduction as required to achieve rim pull requirements.
k. No damage to gearbox components with 100 lbs rim pull.
l. Coordinate with gate stem design such that catastrophic failure occurs at stem nut prior to stem buckling.

8. Tandem gear drives where indicated on Gate Schedule. Tandem drives include parallel gear boxes, Type 316 stainless-steel interconnecting shafting, and flexible couplings furnished by the manufacturer.

2.4 ELECTRIC MOTOR ACTUATORS

A. General:

1. Where specified on the Valve and Gate Schedule.
2. Comply with AWWA C542.
3. Actuators for Valves 3 inches and Smaller: 120 Volt, 1 Phase, 60 Hertz power supply.

a. Actuators for Valves Larger than 3 inches and for slide gates and weir gates: 480 Volt, 3 Phase, 60 Hz power supply.

B. 120 Volt Power Actuators:

1. Actuators to have reversing motor, reduction gearing, local position indicator, position limit switches, provision for manual override, 100 to 1000 in-lbs torque range and motor thermal and electronic control protection.
2. Enclosure:

a. Cast aluminum or steel alloy.
b. Powder coated or fusion bonded epoxy finish.
c. NEMA 4X.

3. Power Train:

a. Self-locking planetary epicyclical gear design.
b. Hardened steel gears with bronze bearings.

c. Housing Penetrations: Seal with mechanical seals.
d. Housing: Equip with space heaters.
e. Mounting System: ISO 5211.

4. Actuator for Open/Close/Jog Reversing Service: Proportional/modulating service where required in the equipment specifications or Instrumentation Drawings.
5. Motors:

a. Design for valve actuation service.
b. Insulation: Class F.
c. Split phase capacitor protection.
d. Duty Cycle: 40 percent at 100 degrees F for open/close duty, and 100 percent for modulating duty.
e. 90-Degree Travel Time: 10 to 20 seconds depending on actuator size.
f. Actuator Switches: Have two SPDT 15 Amp rated switches for remote open/close valve position indication.

6. Products: Subject to compliance with requirements, provide one of the following or equal:

a. Series 92 as manufactured by Asahi/America.
b. EPM-6 by Hayward.
c. P Series as manufactured by Promation Engineering, Inc.
d. Or equal.

C. 480 Volt Power Actuators:

1. General: 3 phase 60 hz supply rated, self-contained, totally enclosed with motor, integral reversing starters, local controls, reduction gearing, limit switch gearing, limit switches, control power transformer, torque switches, bored and keyed drive sleeve for non-rising stems, declutch lever, auxiliary handwheel, and local position indication.
2. Separately seal motor and control compartments with space heaters in limit switch, motor, and control compartments.
3. Suitable for indoor and outdoor use, fully functional in ambient temperature range from 40 to 140 degrees F at 100 percent relative humidity.
4. Size to guarantee full travel, seating and unseating torque or thrust as specified by the valve or gate manufacturer.
5. Size to provide torque required to operate valve or gate at 90 percent of nominal voltage.
6. Design Travel Rate:

a. As indicated on valve and gate schedule, and if not so indicated:

1) Gate Valves and Slide Gates: 12 inches per minute.
a) Motors shall be limited to 7.5 HP regardless of travel speed.
2) Globe Valves: 4 inches per minute.
3) Quarter Turn Valves: 30 seconds per 1 foot of throat diameter.

7. Enclosure:

a. Cast iron construction.
b. NEMA 4X for watertightness from pressure hose.

c. NEMA 6 for submergence up to 6 feet for 30 minutes.
d. NEMA 6P for submergence up to 15 feet for 72 hours.
e. IP 68-8 for submergence up to 26 feet for 96 hours per EN 60529.
f. NEMA 7 for Class 1, Division 1 & 2, Groups C & D hazardous environment.
g. Operate successfully a minimum of 10 full cycles under submersion.
h. External Fasteners: Type 316 stainless steel.
i. Include anti-condensation heater, suitable for continuous operation with alarm output to indicate heater failure.

8. Motors:

a. High-starting torque; low stall torque, low inertia, designed and built by actuator manufacturer.
b. Embed thermistor in each motor winding for thermal protection.
c. Insulation: Class F, with a duty rating of at least 15 minutes at 40 degrees F ambient temperature.
d. Electrical disconnection by means of plug and socket. Allow motor removal without loss of lubricant.
e. Hardware to ensure motor runs with correct rotation for required direction of valve travel regardless of power supply connection sequence.

9. Motor Protection:

a. De-energize without damage in the event of a stall condition when attempting to move a jammed valve.
b. De-energize in the event of an over-torque condition.
c. Imbed a minimum of three thermal devices in motor windings to de-energize the motor in case of overheating.
d. Lost phase protection algorithm.

10. Gear Train:

a. Grease filled, O-ring sealed in cast or ductile iron gear case.
b. Suitable for operation in any orientation.
c. Hardened, machine cut steel gears, and precision machined alloy bronze worm gear.
d. Reduction gearboxes as specified in Paragraph “Gear-Assisted Manual Valve Actuators.”

11. Manual Operation:

a. Handwheel which does not rotate during motor operation.
b. Output contact with declutch mechanism to indicate manual operation.
c. Utilize actuator worm shaft/worm wheel to maintain self-locking gearing and to facilitate changeover from motor to manual operation when the actuator is under load. Do not use designs that bypass actuator worm gear or break valve load at worm gear.
d. Automatic return from manual to motor operation upon starting motor.
e. Manual operation capable with seized motor.

12. Position and Torque Calibration:

    a. Sensing by absolute encoder using hall effect sensors. Incremental encoders requiring batteries to retain settings upon loss of power are not acceptable. Settings stored in permanent non-volatile memory.
    b. Torque and travel adjustment parameters:

        1) Position Setting Range: 10 to 5,000 turns, with resolution of 2.81 degrees and accuracy to 5.0 degrees of actuator output.
        2) Torque Setting: 40 to 100 percent of rated torque.

    c. Torque switch bypass for the torque sensing system to inhibit torque switch trip during unseating or during starting in mid-travel against high inertia loads.

13. Wiring and Terminals:

    a. Tropical grade insulated stranded cable of appropriate size for the control and 3-phase power.
    b. Include a removable plug and socket head for termination of all external wiring. Include actuators without plug and socket terminal connections having power and control disconnect switches for ease of maintenance and safety.

14. Controls:

    a. Microprocessor: Based with mechanically and electronically interlocked reversing contactors for Open/Close duty and solid-state contactors for modulating duty.
    b. Local/Off /Remote Selector Switch and Open/Stop/Close Pushbuttons: Mount on actuator face with red and green indication lights for open/close and amber for fault.
    c. Remote On/Off Service: Actuator to accept one remote signal to open and a second remote signal to close.
    d. Modulating Service: When in remote mode, actuator to accept a 4 to 20 mA DC position control signal and position valve 0 to 100 percent of travel in proportion to control signal.
    e. Monitoring Relays: Remotely indicate fault signal for indication of power failure, phase failure, thermal switch tripped, torque switch tripped between travel stops, and Local-Off-Remote selector switch position.
    f. Gear Actuated Position Transmitter: On modulating duty actuator that is a two-wire device, produce 4 to 20 mA DC signal proportional to 0 to 100 percent travel.
    g. Transmitter: Have easily accessible zero and span adjustment potentiometers.
    h. DC Power Supply: Integral with operator and powered from 110-volt AC internal transformer. Positioner board to provide repeatable accuracy to 0.25 percent of span and have separate trim pots for zero, span, and dead band adjustment.

15. Position Indication: Continuous mechanical dial indication of valve and gate position in step with the actuator at all times in both the hand wheel and motor operation. For modulating applications, graduations on mechanical dial position indicator to be 0 to 100 percent scale.
16. Limit Switches:

    a. Adjustable type to trip at any point between fully opened and fully closed.

b. Mid-travel Switches: Provide as noted in valve and gate schedule.
c. Do not allow set position to be lost if over travel occurs in either manual or electric modes of operation.
d. Two independent and fully adjustable rotary type position limit switches each with 15 Amp DPDT contacts for remote open/close position indication.

17. Torque Switches: Actuator with adjustable torque switches and be responsive to load encountered in either direction of travel.
18. Terminal Compartment:

a. Separate from the inner electrical components of actuator with a watertight seal.
b. Three threaded cable entries.
c. Stud-type Terminals: Embed in a terminal block of high tracking-resistance compound.
d. Three-phase Power Terminals: Shroud from control terminals by means of an insulating cover.

19. Remote Control Stations:

a. For actuators located below the operating floor, located more than 7 feet above the operating floor, or where indicated on the drawings, provide a UL Listed remote control station at the operating floor level with the same enclosure rating as the actuator.
b. Include a Local/Off/Remote selector switch, Open/Stop/Close pushbuttons and Open/Close indicating lights.

1) Local/Off/Remote selector to include padlock mount for the Off position.

c. Include auxiliary contacts for remote indication of switch position.

20. Manufacturers: Provide products by one of the following or equal.

a. IQ/IQM as manufactured by Rotork, Plc.
b. Limitorque QX/MX as manufactured by Flowserve Corporation.
c. EIM TEC2000 as manufactured by Allied Valve, Inc.
d. AUMA SA/SAR as manufactured by AUMA Riester GmbH & Co. KG.

2.5 SOURCE QUALITY CONTROL

A. Factory Testing:

1. Shop inspect and test completed assemblies.
2. Factory performance test each actuator and supply individual test certificates. Submit test certificates prior to shipment of valve actuators. Test equipment to simulate a typical valve and gate load, and record the following parameters:

a. No load current.
b. Current at maximum torque setting.
c. Stall current.
d. Torque at maximum torque setting.

e. Stall torque.
f. Test voltage and frequency.
g. Flash test voltage.
h. Actuator output speed.

B. Owner Inspection:

1. Make completed actuator assembly available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify field dimensions are as indicated on Shop Drawings.

3.2 INSTALLATION

A. Install products plumb, square, and true according to manufacturer’s published installation instructions.

B. Securely mount actuators using brackets or hardware specifically designed for attachment to valves/gates.

C. Extend chain actuators to 5-1/2 feet above operating floor level.

3.3 FIELD QUALITY CONTROL

A. After installation, inspect for proper supports and interferences according to manufacturer’s requirements and Section 400551 “Common Requirements for Process Valves”.

B. Repair damaged coatings with material equal to original coating.

© 2026 CDM Smith
All Rights Reserved

3.4 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Perform adjustments during normal occupancy hours.

3.5 DEMONSTRATIONS

A. Train Owner's maintenance personnel to adjust, operate, and maintain actuators.

1. Time Duration: Allow four hours during a single day.

SECTION 400559.23 - STAINLESS STEEL SLIDE GATES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Stainless steel slide gates.

B. Related Requirements:

1. Section 400523 “Common Work Results for Process Valves” for powered lifting devices.
2. Section 400557 “Actuators for Process Valves and Gates.”

1.3 DEFINITIONS

A. Operating Head: Distance from centerline of gate to maximum water level of channel.

1.4 ACTION SUBMITTALS

A. Product Data: Manufacturer's product information for system materials and component equipment.

B. Shop Drawings:

1. System materials and component equipment.
2. Description of materials cross-referenced to a sectional drawing listing material by trade name and ASTM reference number.
3. Certified shop and installation drawings showing details of construction, dimensions and anchor bolt locations.
4. Installation and anchoring requirements, fasteners, and other details.
5. Descriptive literature, bulletins and/or catalogs of the equipment.
6. The weight of each component.
7. Description of surface preparation and shop prime painting of gates and accessories.
8. Gate identification number, location, service, type, size, design pressure, operator details, stem details, and loads.
9. Listing of forces transmitted to floor stands if applicable.

© 2026 CDM Smith
All Rights Reserved

1.5 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificate: Products meet or exceed specified requirements.

B. Manufacturer's Instructions: Detailed instructions on installation requirements, including storage and handling procedures.

C. Source Quality-Control Submittals: Results of shop and factory tests and inspections.

D. Field Quality-Control Submittals: Results of Contractor-furnished tests and inspections.

E. Manufacturer Reports:

1. Certify that equipment has been installed according to manufacturer's instructions.
2. Document activities on Site, adverse findings, and recommendations.

F. Qualifications Statements:

1. Submit qualifications for manufacturer and licensed professional.

1.6 DELEGATED DESIGN SUBMITTALS

A. Delegated Design Submittals: Submit signed and sealed Shop Drawings with design calculations and assumptions for seating pressure.

B. Copy of PE License of Engineer of Record.

1.7 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of installed slide gates and components.

B. Operation and Maintenance Data: Submit maintenance instructions for equipment and accessories.

1.8 MAINTENANCE MATERIAL SUBMITTALS

A. Spare Parts:

1. Furnish one set of manufacturer's recommended spare parts.

B. Tools: Furnish special wrenches and other devices required for Owner to maintain equipment. Provide special tools and spare parts required for normal operation and maintenance of the equipment.

C. O&M Manual: two copies of manufacturer's operation and maintenance manuals.

1. Include required cuts, drawings, equipment lists, descriptions, etc. to instruct operating and maintenance personnel unfamiliar with such equipment.
2. Include trouble shooting data and full preventive maintenance schedules.

D. Factory Representative: Provide one day to instruct representatives of the Owner on proper operation and maintenance of the equipment.

1.9 QUALITY ASSURANCE

A. Materials in Contact with Potable Water: Certified to NSF Standard 61 and NSF Standard 372.

B. Perform Work according to standards set by authorities having jurisdiction.

C. Maintain a copy of each standard affecting Work of this Section on Site.

1.10 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer's instructions.

C. Protect materials from physical damage, moisture and dust by storing in clean, dry location remote from areas involved in construction operations.

1. Provide additional protection according to manufacturer's instructions.

1.12 EXISTING CONDITIONS

A. Field Measurements: Verify field measurements prior to fabrication. Document field measurements on Shop Drawings.

1.13 WARRANTY

A. Furnish three-year manufacturer's warranty for slide gates.

B. Furnish five-year manufacturer's warranty that clear plastic stem covers will not crack, discolor, or become opaque.

PART 2 - PRODUCTS

2.1 PERFORMANCE AND DESIGN CRITERIA

A. Seating pressure:

1. Three feet of water.
2. Measurement: From maximum water surface to centerline of gate.

B. Minimum Vertical Loading: 50 percent of force on the gate from operating head acting on horizontal centerline of gate, multiplied by effective gate area, plus weight of slide and stem.

C. Gate Reinforcement: As required for deflection not greater than 1/360 of span.

D. Operating Head:

1. Safety Factor: Design gate to operate under specified operating head with safety factory of five.

2.2 STAINLESS STEEL SLIDE GATES

A. Manufacturers:

1. Golden Harvest, Inc.
2. Whipps
3. Waterman Industries.

B. Description:

1. Comply with AWWA C561.
2. Self-contained stainless steel slide gate, with extended frame, yoke, lifting stem attached to yoke, lift and lift support, stem, stem guide, and stem block.
3. Size: As indicated on Drawings.
4. Operating Head: fourteen feet.
5. Closure: Conventional.
6. Opening: Upward.

C. Gates: Type 304 stainless steel, self-contained type with disc arranged to lower or raise to open and with guides designed to mount on the face of or embedded in concrete.

1. Disc or Sliding Member: Type 304 and the stainless steel plate reinforced with "U" or angle-shaped stainless steel members welded to the plate not more than 16 inch apart.

a. Deflection: 1/360 of span of the gate under the design head.
b. Reinforcing Ribs: Extend into guides so they overlap seating surface of the guide.
c. A Specially Molded Resilient Seal:

1) Mounted on bottom of embedded unit discs or on the edge of the disc to provide flush bottom closure.
2) Seal Shape: Produce a seating surface with minimum width of 3/4 inch and extend into secondary slot of the guide.
3) Vertical Seal Face: In contact with seating surface of guide providing a proper seal at the corners.

d. Reinforcements, Retainer and Bolts: Same material as disc.

e. The invert of embedded unit frames to have an angle welded to the lower ends of the guides forming a seating surface for a resilient seal mounted on the disc. Angle to be the same material as the guides.

2. Minimum Thickness: 1/4 inch.
3. Configuration: Removable.

D. Guides: Type 304 stainless steel construction, designed for maximum rigidity, weighing a minimum of 3 lbs per foot.

1. Holes for anchor bolts every 18 inches for face mounted units or embedding keyways for embedded units.
2. Guides to extend beneath opening a sufficient amount to support the disc in fully down or open position for downward opening gates.
3. Weld angle to guides across the invert of the opening on face-mounted gates and up both sides of all gates.
4. Provide a rigid sealing system comprising of low friction high abrasion resistant self-adjusting seals of UHMWPE fitted on frame with compression resilient cord seals to ensure forced contact between seal and face of slide.
5. Arrange seal so it deflects 1/16 inch minimum. Angle, strips and bolts to be the same material as the guides.
6. Where guides extend above operating floor, they must be sufficiently strong, so no further reinforcing is required.
7. Where required, the yoke supporting the operating bench stand will be formed by two angles welded at top of the guides providing a one-piece rigid frame.

E. Yokes: Structural steel. Bolted to gate frame.

1. Arrangement: Disc and stem to be removable without disconnecting the yoke.

F. Seats: Impacted into dovetail slots and held in position without use of screws or other fasteners.

1. Maximum Clearance between Seating Faces: 0.004 inch when gate is fully closed.

G. Wedges: Machined brass blocks with angled faces and secured with a stud bolt to prevent slippage during operation.

1. Wedge Types: Side, top, and bottom.

H. Frames: One-piece configuration.

1. Mounting: Channel wall.
2. Material: Type 304 stainless steel.
3. Furnish continuous embed or mounting flange.
4. Thickness: 1/4 inch.
5. Seats: Ultra-high-molecular-weight polymer.
6. Bottom Flush Closure: Resilient seal securely attached to frame along invert.

I. Lifting Nut: Brass.

1. Grease fitting.

2. Polymer bearing pads above and below lifting nut.

J. Lifting Stem: Type 304 stainless steel for the entire length.

1. Tensile Strength: 60,000 psi.
2. Diameter: Of sufficient size at base of thread to lift the weight of the gate, offset the resistance of the gate to the maximum unbalanced head and fully allow for starting impact.
3. Transmit in compression at least two times the rated output of the crank operated floor stand with a 40 effort on the crank.
4. Stems More Than One Section: Joined by stainless steel couplings pinned and bolted to the stems.
5. Threaded and Keyed Couplings of Same Size: To be interchangeable.
6. Bronze Stop Collars: On the stem preventing over closing of the gate.
7. Minimum Diameter: 1-1/2 inch to withstand twice the rated output of the operator.
8. Slenderness Ratio (l/r): Less than 200.
9. Stem Guides: Provide as recommended by manufacturer. High nickel content cast iron, bronze brushed, mounted in a high nickel content cast iron bracket. Adjustable in two directions and spaced at sufficient intervals to adequately support the stem. Spacing not to exceed 10 feet.
10. Configuration: Rising. Removable.
11. Thread: Machine cut threads, Acme type, double lead. Cut threads are not acceptable.
12. Fully lubricated.
13. Maximum Number of Turns: 16 per foot of travel.
14. Stem Covers: Provide rising stem gates with clear fracture resistant polycarbonate covers.

    a. Will not discolor or become opaque for a minimum of 5 years after installation.
    b. Capped, vented, and of a length to allow full travel of gate.
    c. Bottom end mounted in a housing or adapter plate for easy field mounting.
    d. Indicator markings showing gate position.

2.3 FINISHES

A. Stainless-Steel Surfaces: Mill finish.

2.4 ACCESSORIES

A. Hardware: Type 304 stainless steel. Conform to ASTM A193/A194 and F593/F594 unless otherwise specified.

B. Attaching Bolts and Anchor Bolts: Type 304 stainless steel. Furnished by slide gate manufacturer.

C. Nameplates: Per Section 460553, “Identification for Water and Wastewater Equipment.”

2.5 SOURCE QUALITY CONTROL

A. Shop inspection and testing of completed assemblies.

B. Owner Inspection: Make completed clarifier equipment available for inspection at manufacturer's factory prior to packaging for shipment. Notify Owner seven days before inspection is allowed.

C. Owner Witnessing: Allow witnessing of factory inspections and test at manufacturer's test facility. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance: When fabricator is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at fabricator's facility conforms to Contract Documents.

1. Specified shop tests are not required for Work performed by approved fabricator.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify facilities are ready to receive slide gates.

3.2 PREPARATION

A. Clean surfaces according to manufacturer's instructions.

3.3 INSTALLATION

A. Install slide gates according to manufacturer's instructions.

B. Ensure products are installed plumb, true, and free of warp or twist.

C. Locate operators to avoid interference with handrails and other Work.

D. Gate Installation: Under the supervision of the gate manufacturer’s factory representative.

1. Factory Representative: Furnish services for one day. Who has complete knowledge of proper installation, startup and operation of cast iron slide gates. Inspect the final installation and supervise a test of the equipment.

E. If there are difficulties in operation of the equipment due to the manufacturer's fabrication or Contractor's installation, additional service will be provided at no cost to the Owner.

F. Guides: Surface and Flange Mounted.

1. Install guides with expansion anchors.
2. Position guides at elevation as indicated on Drawings.

G. Guides: Recessed.

1. Cut slot in concrete to receive guides.

2. Position guides at elevation as indicated on Drawings.
3. Grout guides in place according to manufacturer's instructions.

H. Sealant:

1. Apply 1/8 inch thick layer of elastomeric sealant to back of frame.
2. Tighten nuts snug until sealant begins to flow beyond frame.
3. Remove excess sealant.
4. Cure sealant for minimum seven days.
5. Tighten nuts to their final positions.

I. Lubricants: Oil and grease as required for initial operation.

3.4 FIELD QUALITY CONTROL

A. Inspection: Verify gate and components alignment, smooth operation, with no binding or scraping.

B. Testing per AWWA C561:

1. Leakage Under 20 feet of Seating Head: 0.05 gpm/ft. of seating perimeter
2. Leakage Under 20 feet of Unseating Head: 0.2 gpm/ft. of seating perimeter
3. After installation, field test slide gates ensuring items of equipment are in compliance with Specifications, including leakage requirements.
4. Leakage tests shall be performed for a minimum 24 hour duration unless otherwise approved by the Engineer.
5. For units failing to meet specified requirements, make necessary change and retest units. If unit remains unable to meet test requirements to Engineer’s satisfaction, it will be replaced with a satisfactory unit at no additional cost to Owner.

C. Manufacturer Services: Manufacturer's representative experienced in installation of products furnished per this Section for a minimum of one day on Site for installation, inspection, field testing, and instructing and training Owner's personnel in maintenance of equipment.

D. Equipment Acceptance: Adjust, repair, modify, or replace components failing to perform as specified and re-inspect.

1. Make final adjustments to equipment under direction of manufacturer's representative.

E. Furnish physical checkout and installation certificate from equipment manufacturer's representative attesting equipment has been properly installed and is ready for startup and testing.

F. Submit the equipment manufacturer's Certificate of Field Testing.

G. Submit the equipment manufacturer's Certificate of Functional Testing.

3.5 ADJUSTING

A. Adjust slide gates to provide smooth operation.

© 2026 CDM Smith
All Rights Reserved

3.6 DEMONSTRATION

A. Demonstrate equipment operation, routine maintenance, and emergency repair procedures to Owner's personnel.

3.7 ATTACHMENTS

A. Slide Gate Schedule:

1. SG-1:

a. Description: Influent Channel, Gate SG-1.
b. Material: Stainless steel.
c. Size: 5 by 12 feet. – Field verify dimensions.
d. Operating Head: 14 feet.
e. Stem Configuration: Rising.
f. Closure: Bottom flush.
g. Opening: Upward.
h. Operator: Motor Actuated with manual handwheel.
i. Area Classification: Class 1, Div 1
j. Motor Power: 480v/3pH/60 Hz
k. Additional Requirements:

1) Gate and actuator construction must be coordinated so that the gate can be opened when subjected to a seating pressure of 1.5 feet above the gate centerline.
2) Gate must seat watertight with allowable leakage specified above when experiencing a seating pressure of 2 feet above the bottom of the gate.

SECTION 400561 - GATE VALVES (OWNER-SUPPLIED)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Solid wedge, resilient-seated gate valves.

B. Refer to the Valve Schedule for Gate Valves that are to be supplied by the Owner as part of a pre-purchase agreement under separate contract.

C. Related Requirements:

1. Section 220523 “General-Duty Valves for Plumbing Piping”: Miscellaneous plumbing valves as required by Project.
2. Section 400551 “Common Requirements for Process Valves”: Basic materials and methods related to valves commonly used for process systems.
3. Section 400557 “Actuators for Process Valves and Gates”.

1.3 DEFINITIONS

A. Outside screw and yoke (OS&Y) valve: A valve in which the operating screw is driven by a threaded nut that is built into the handle.

1.4 SUBMITTALS

A. As specified in Section 400551 “Common Requirements for Process Valves”: Submittal requirements for compliance with this section.

1.5 QUALITY ASSURANCE

A. Test valves in accordance with AWWA C500, C509, C515.

B. Provide Installation Inspection and Operator Training per Section 40 05 51 “Common Requirements for Process Valves”.

C. Provide testing and inspection certificates.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 SOLID WEDGE, RESILIENT-SEATED GATE VALVES

A. Manufacturers:

1. M&H Valve.
2. Mueller
3. J&S Valve.
4. American R/D Valve.

B. Description:

1. Wastewater service.

a. Valve shall have full port nominal port diameter unobstructed when in full open position.
b. Valve shall be rated for solids-laden wastewater service.

2. As specified in Section 40 05 51 “Common Requirements for Process Valves”.
3. Comply with AWWA C509 and C515.
4. Working Pressure: 250 psig at 248 deg. F.
5. End Connections: ASME B16.1, ASME B16.5, and ASME B16.42, flanged.
6. Body: No recesses in valve body.
7. Suitable for horizontal orientation as per process drawings equipped with scrapers. Rollers or sliders as required.

C. Operation:

1. As specified in Section 40 05 51 “Common Requirements for Process Valves”.
2. Stem: Non-Rising. Stem diameters and the prescribed number of turns to open shall be not less than the applicable requirements of Table 8 of ANSI/AWWA C515.
3. Refer to Valve Schedule for operation.

a. Motor Actuated.

1) Provide electric actuators for gate valves >24” according to project drawings and valve schedule.
2) Where shown in valve schedule and drawings, include extended stems and floor stands.
3) See Section 400557 “Actuators for Process Valves and Gates” for electric actuator requirements.
4) Electric actuators shall be provided as a matched assembly from the valve vendor to ensure correct torque and opening speeds are met.

b. Handwheel.

D. Materials:

1. Wedge: ASTM A126, cast iron or ASTM A536, ductile iron, fully encapsulated with synthetic rubber bonded and vulcanized in accordance with ASTM B429, Method B. Mechanically attached seats, exposed iron on the wetted wedge, double-disc construction, metal solid-wedge construction, and metal plow-style designs are not permitted.
2. Body and Disc: ASTM A126, cast iron or ASTM A536, ductile iron.
3. Stem, Stem Nuts, Glands, and Bushings: Type 316 stainless steel.
4. Connecting Hardware: Type 316 stainless steel.

E. Finishes:

1. As specified in Section 40 05 51 “Common Requirements for Process Valves”.
2. Body, Internal and External, Including Bonnet: AWWA C550, Epoxy, 12-mil minimum thickness.
3. Gate: ASTM D2000 EPDM encapsulated or ASTM D429 Method B Bonded and vulcanized.

2.2 SOURCE QUALITY CONTROL

A. As specified in Section 400551 “Common Requirements for Process Valves”.

B. Testing: Test gate valves according to AWWA C509 and C515.

C. UL and FM approved.

PART 3 - EXECUTION

3.1 EXAMINATION

A. As specified in Section 400551 “Common Requirements for Process Valves” for compliance requirements.

B. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

C. Operate valves in position from fully open to fully closed. Examine guides and seats made accessible by such operations.

D. Examine threads on valve and mating pipe for form and cleanliness.

E. Do not attempt to repair defective valves; replace with new valves.

3.2 INSTALLATION

A. According to AWWA C500, C509, and C515.

B. As specified in Section 400551 “Common Requirements for Process Valves.”

C. Locate valves for easy access and provide separate support where necessary.

D. Install valves in horizontal piping with stem above center of pipe or in accordance with contract drawings.

E. Install valve tags. Comply with requirements in Section 400553 “Identification for Process Piping” for valve tags.

3.3 FIELD QUALITY CONTROL

A. Inspection:

1. Inspect for damage to valve lining or coating and for other defects that may be detrimental as determined by Engineer.
2. Repair damaged valve or provide new, undamaged valve.
3. After installation, inspect for proper supports and interferences.

B. Pressure Testing: As indicated in piping schedule.

C. Pressure test valves with piping.

3.4 CLEANING

A. Keep valve interior clean as installation progresses.

B. After installation, clean valve interior of soil, grit, loose mortar, and other debris

SECTION 400561.43 - KNIFE GATE VALVES (OWNER-SUPPLIED)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

1. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Bonneted resilient seat design knife gate valves.

B. Resilient Seat Knife Gate Valves are to be supplied by the Owner as part of a pre-purchase agreement under separate contract. This specification is included for reference.

C. Related Requirements:

1. Section 400557.00 “Actuators for Process Valves and Gates.”
2. Section 400551 “Common Requirements for Process Valves” Administrative requirements and basic materials and methods related to valves commonly used for process systems.

1.3 SUBMITTALS

A. As specified in Section 400551 “Common Requirements for Process Valves” Submittal requirements for compliance with this Section.

1.4 QUALITY ASSURANCE

A. Test valves in accordance with AWWA C520.

B. Provide Installation Inspection and Operator Training per Section 400551.

C. Provide testing and inspection certificates.

PART 2 - PRODUCTS

2.1 BONNETED METAL SEAT KNIFE GATE VALVES – Tag Type KGV3, VPKGV3

A. Manufacturers:

1. Pratt Figure F193
2. Hilton Model H-200-BV-T304.
3. Fabri-Valve F134R.

B. Description:

1. Normal Working Pressures: 15 - 35 psig.
2. Minimum Rated Working Pressure: 75 psig.
3. Maximum Fluid Temperature: 120 deg. F.
4. Design:

   a. Pressure-retaining bonnet that fully encloses the gate.
   b. Rising stem or non-rising stem per drawings and valve schedule
   c. Bonnet rated at the same pressure as the valve body; internal gate packing or gate wiper not permitted.
   d. Bi-directional shutoff resilient seat ring.
   e. 2 inch flush and drain ports same material as the wetted parts.
   f. 3/4 inch flush and drain ports same material as the wetted parts.
   g. Type 304 SS body cladding and face rings fully welded to the carbon steel body – "floating" body liners not permitted.
   h. Stainless steel welding pickled and passivated per ASTM A380, A967.
   i. Valves 20 inches and larger, provide hardened gate support strips for valve gates oriented on edge.
   j. Valves shall have nominal full port internal diameter which shall be unobstructed when in full open position.

5. Packing:

   a. Provide packing gland at the top of the bonnet to achieve a tight seal around the stem.
   b. Design Yoke to support the operator without any movement or twisting at the stall thrust capability of the operator
   c. Packing: replaceable without disassembling the valve or removing the valve from the pipeline.

6. Stem:

   a. Rolled Acme threads.
   b. Where shown in drawings, provide extended stem and floor stand

7. Seats:

   a. Fluoroelastomer seating, with 304 stainless steel ring raised seat face.
   b. Bi-Directional Resilient Seats for bubble tight shutoff from both directions.

8. End Connections:

   a. Raised face flanged:

      1) ANSI 125/150 drilling.
      2) Machine groove flange faces to comply with MSS SP-6.

3) Thread flange bolt holes.

9. Actuator:

a. Electric Actuator

1) Provide electric actuators for knife gate valves >24" according to project drawings and valve schedule.
2) Where shown in valve schedule and drawings, include extended stems and floor stands.
3) See Section 400557 "Actuators for Process Valves and Gates" for electric actuator requirements.
4) Electric actuators shall be provided as a matched assembly from the valve vendor to ensure correct torque and opening speeds are met.

b. Handwheel

1) For knife gate valves >= 24"
2) Chainwheel operators required for 24" knife gate valves as shown in project drawings. See Section 400557 "Actuators for Process Valves and Gates" for chainwheel requirements.
3) Handwheel sized to seat and unseat the knife gate valve at the specified operating pressure with a maximum rim pull of 40 lb.
4) If necessary to achieve 40 lb rim pull, provide a bevel gear operator.

a) Fully enclosed and permanently lubricated, with a sealed housing to prevent contamination.
b) Meet the requirements of 400551 - Common Requirements for Process Valves.
c) Provide a stem cover to protect the stem when the valve is in the open position.

C. Materials:

1. Body: Fabricated carbon steel
2. Gate: Type 316 stainless steel
3. Connecting Hardware: Fabricated steel
4. Stem: Type 316 stainless steel

a. Stem nut: acid resistant bronze.

5. Yoke: Carbon steel
6. Packing Gland & Bolts: Type 316 stainless steel

a. Nuts: naval bronze.

7. Wear Strip: UHMW with EPDM o-ring resilient seat
8. Gate Wiper: UHMW

D. Finishes:

1. As specified in Section 400551 “Common Requirements for Process Valves”.
2. Provide standard factory finish coating.

2.2 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

B. As specified in Section 400551 “Common Requirements for Process Valves”.

PART 3 - EXECUTION

3.1 EXAMINATION

A. As specified in Section 400551 “Common Requirements for Process Valves”: Submittal requirements for compliance with this Section.

3.2 INSTALLATION

A. As specified in Section 400551 “Common Requirements for Process Valves.”

B. According to Manufacturer’s Instructions.

END OF SECTION 400561.43

SECTION 400562 - PLUG VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Eccentric plug valves.

B. Related Requirements:

1. Section 220523 “General-Duty Valves for Plumbing Piping”: Miscellaneous plumbing valves as required by Project.
2. Section 400551 “Common Requirements for Process Valves”: Basic materials and methods related to valves commonly used for process systems.
3. Section 400557 “Actuators for Process Valves and Gates”: Requirements for actuators.

1.3 SUBMITTALS

A. As specified in Section 400551 “Common Requirements for Process Valves”: Submittal requirements for compliance with this Section.

1.4 QUALITY ASSURANCE

A. Test valves in accordance with AWWA C517.

B. Provide Installation Inspection and Operator Training per Section 400551.

C. Provide testing and inspection certificates.

PART 2 - PRODUCTS

2.1 ECCENTRIC PLUG VALVES – Tag Type PV1

A. Manufacturers:

1. DeZurik.
2. M&H Valve
3. Clow Valve Company; a subsidiary of McWane, Inc.
4. Henry Pratt Company; a Mueller brand.

5. Kennedy Valve Company; a division of McWane, Inc.
6. Val-Matic Valve & Manufacturing Corp.

B. Description:

1. As specified in Section 400551 “Common Requirements for Process Valves.
2. Type”:

    a. Offset disc type
    b. Non-lubricated
    c. Serviceable (able to be repacked) under full line pressure
    d. Eccentric.
    e. Capable of sealing in both directions at the rated pressure
    f. Unobstructed flow path when open
    g. Drop tight shut-off to the full valve rating with pressure on either side of the plug.

3. Body:

    a. 30,000-psi tensile strength
    b. Top entry, bolted bonnet
    c. Body shall be cast with integral piping connections

4. Plug:

    a. To be removable without removing the valve from the line.
    b. To have an integral upper and lower shaft:

        1) seals on the upper and lower journals to prevent entrance of solids into the journals.

    c. One piece for all valves.

5. Bearings:

    a. Permanently lubricated.

6. Working Pressure: 150 psig at 70 deg. F.

    a. At the above rated minimum working pressures, certified by the manufacturer as permitting zero leakage for a 5-minute duration with full pressure applied in either direction.

7. Maximum Process Fluid Temperature: 100 deg. F.
8. Ports:

    a. Minimum Port Area: 80 percent of nominal pipe area for valves 20 inches and smaller; 70 percent for valves larger than 20 inches.

9. Seats:

    a. Full 360 degree seating by contact of a resilient seating material on the plug mating with welded-in seating surface in the body.

b. Screw in body seats not acceptable.
c. Resilient and of the continuous interface type having consistent opening and closing torques.
d. Non-jamming in the closed position.

10. Stem Bearings: Self-lubricating.
11. Stem Seals:

a. Type: V-ring.
b. Externally adjustable and repackable without removing the bonnet from the valve, or self adjusting.

12. Packing and Gland: Accessible and externally adjustable.
13. End Connections:

a. Flanged: Comply with ASME B16.1 and B16.42.

C. Operation:

1. As specified in Section 400551 “Common Requirements for Process Valves”.
2. A suitably sized steel actuator mounting bracket shall be provided to provide an air gap between the actuator and the valve stem seal. Under no circumstance shall the gear box be mounted directly to the top body flange such that leakage could directly enter the gear box.
3. Provide adjustable limit stops for both opening and closing and a clearly marked position indicator.
4. 4 Inches and Smaller: Manual, provided with its own securely attached lever.
5. Greater Than 4 Inches: Worm gear manual operators with handwheel.
6. Furnish chain wheel operators for valves mounted over **7** feet above floor.
7. Where shown on the process drawings, provide electric actuators in accordance with 400557 “actuators for Process Valves and Gates”.

D. Materials:

1. Body:

a. Ductile iron, ASTM A536
b. Lining: Epoxy, as recommended by valve manufacturer for service conditions.

2. Plug:

a. Ductile iron, ASTM A536, Grade 65-45-12
b. Lining: Resilient coating, as recommended by valve manufacturer for service conditions.

3. Seats: Stainless steel 316SS.
4. Stem: Type 316 stainless steel.
5. Stem Bearings: Stainless steel.
6. Seals: PTFE**.**
7. Connecting Hardware: Type 316 stainless steel

E. Finishes: As specified in Section 400551 “Common Requirements for Process Valves”.

2.2 ROUND, FULL PORT PLUG VALVES – Tag Type PV2

A. Manufacturers:

1. VAG/GA ECO Centric.
2. Pratt Ballcentric.
3. Milliken.

B. Round full port plug valves shall be equal in all respects as Tag Type PV1 except plug shape shall provide for a round, 100% open area viewing the open valve from the end.

2.3 SOURCE QUALITY CONTROL

A. As specified in Section 400551 “Common Requirements for Process Valves”.

B. Testing: Hydrostatic Test Per ANSI B16.1 and B16.5.

C. Submit an affidavit of compliance stating that the valves have been manufactured and tested in accordance with AWWA C504-00, Section 5.2.4 and specifically list all exceptions.

PART 3 - EXECUTION

3.1 EXAMINATION

A. As specified in Section 400551 “Common Requirements for Process Valves”: Submittal requirements for compliance with this Section.

3.2 INSTALLATION

A. According to AWWA C517.

B. Horizontal Piping: Stem horizontal, Plug opening to crown of body.

C. Vertical Piping: Plug at top when closed.

D. Plugs: On top when open and on pressure side when closed.

SECTION 400563 - BALL VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Two-piece brass body ball valves.
2. Thermoplastic ball valves.

B. Related Requirements:

1. Section 220523 “General-Duty Valves for Plumbing Piping”: Miscellaneous plumbing valves as required by Project.
2. Section 400551 “Common Requirements for Process Valves”: Basic materials and methods related to valves commonly used for process systems.

1.3 SUBMITTALS

A. As specified in Section 400551 “Common Requirements for Process Valves”: Submittal requirements for compliance with this Section.

1.4 QUALITY ASSURANCE

A. Test valves in accordance with AWWA C504, API 598, MSS SP61 as applicable for types listed herein.

B. Provide Installation Inspection and Operator Training per Section 400551.

C. Provide testing and inspection certificates.

PART 2 - PRODUCTS

2.1 TWO-PIECE BRASS BODY BALL VALVES 3-INCH AND SMALLER- Tag Type BV3

A. Manufacturers:

1. Apollo Valve.

2. Milwaukee Valve.
3. NIBCO Inc.

B. Description:

1. Standard: MSS SP-110
2. SWP Rating: 150 psi.
3. CWP Ratings for Valves NPS 1/4 to NPS 2: 600 psi.
4. CWP Ratings for Valves NPS 2-1/2 to NPS 4: 400 psi.
5. Body Design: Two-piece.
6. Body Material: Forged Brass.
7. Ends: Threaded or soldered joint.
8. Seats: PTFE.
9. Stem Material: 316 Stainless steel.
10. Stem Extension Sleeve Material: Aluminum to extend operating handle past pipe insulation.
11. Ball Material: 316 Stainless steel.
12. Port: Full.
13. Packing Material: PTFE.
14. Operator: Steel lever with zinc plating and vinyl grip.

2.2 THERMOPLASTIC BALL VALVES

A. Manufacturers:

1. Hayward Flow Control.
2. George Fischer
3. ASAHI,
4. Spears.

B. Description:

1. Working Pressure: 150 psig at 70 deg. F.
2. Maximum Process Fluid Temperature: 100 deg. F.
3. Ports: Full size.
4. End Connections:

a. Flanged: Comply with ASME B16.5
b. Union.

C. Operator: Hand lever

D. Materials:

1. Body and Ball: PVC, ASTM D1784 or CPVC, ASTM D1784. Material to match piping.
2. Seats: PTFE.
3. Seals: EPDM.

All Rights Reserved

2.3 SOURCE QUALITY CONTROL

A. As specified in Section 400551 “Common Requirements for Process Valves”.

B. Testing: Test ball valves according to AWWA C507.

PART 3 - EXECUTION

3.1 INSPECTION

A. As specified in Section 400551 “Common Requirements for Process Valves”: Submittal requirements for compliance with this Section.

3.2 INSTALLATION

A. According to AWWA C507.

B. As specified in Section 400551 “Common Requirements for Process Valves”.

SECTION 400565.13 - CONE VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Cone valves, to be used as check valves on the discharge line for the six influent pump station pumps.

B. Related Requirements:

1. Section 400551 "Common Requirements for Process Valves" for administrative requirements and basic materials and methods related to valves commonly used for process systems.
2. Section 406196 “Process Control Descriptions” for pump control logic during start-up and shut-down.
3. Section 432341 “End Suction Solids Handling Pumps”.

1.3 COORDINATION

A. Coordinate Work of this Section with piping and equipment connections as specified in other Sections and as indicated on Drawings.

1.4 SUBMITTALS

A. Product Data: Cone valves.

B. Shop Drawings: Drawings showing installation arrangement of major component assemblies.

C. Source Quality-Control Reports: For cone valves.

D. Qualifications Statement: For manufacturer.

1.5 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of piping, valves and other appurtenances, connections, and centerline elevations.

© 2026 CDM Smith
All Rights Reserved

1.6 QUALITY ASSURANCE

A. Manufacturers Qualifications: Company specializing in manufacturing products specified in this Section with minimum 10 years' documented experience.

B. Valve, electro-hydraulic actuator, and controls are to be furnished as a fully integrated assembly by the valve manufacturer. The valve manufacturer shall be responsible for actuator sizing, system integration, assembly, factory testing, operation, and warranty of the complete valve-actuator-control system in accordance with AWWA C522.

1. Certified test reports to be provide upon request.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Protect valves and appurtenances by storing off ground.
3. Provide additional protection according to manufacturer instructions.

1.8 WARRANTY

A. Furnish five-year manufacturer's warranty for cone valves.

PART 2 - PRODUCTS

2.1 CONE VALVES

A. Manufacturers.

1. Ross Valves

a. Model Ross RCV.

2. DeZURIK, Inc.

a. Willamette AWWA Rotary Cone Valves – Model VMC.

B. Description:

1. Manufactured in accordance with AWWA C522.
2. Conical Plug Type, consisting of:

a. A valve body having waterway inlet and outlet diameters equal to the nominal size of the valve.
b. A fully skirted conical plug having a clear waterway diameter equal to the nominal size of the valve.
c. A cover to enclose the plug in the body.
d. A valve operating mechanism mounted on the cover.
e. A flange body housing with flanged inlet and outlet waterways and flange opening.

1) Provide flange opening with removable plug.

3. Designed for use in horizontal pipeline as indicated on the Drawings.

4. Suitable for pump start-up, shutdown, and throttling service without significant cavitation or excessive vibration. The valve shall operate in the fully opened and in throttling positions without noticeable drifting or vibration of the plug and shall be free of backlash or loose connections in the operating mechanism, linkage, and shaft connections.

5. Operation:

a. Axial motion to unseat the plug; then
b. Rotary motion to open/close the valve; then
c. Axial motion to reseat the plug.
d. During rotation of the plug, provide clearance between the plug and body seat rings at all times so that no contact occurs.

6. Size: As indicated on Drawings.
7. Process Fluid: Screened raw sewage.
8. Maximum Working or Rated Pressure: 150 psig

C. Cone Valve Construction:

1. Body:

a. Materials: Ductile iron; ASTM A536 Grade 65-45 12.
b. Body Flange:

1) Comply with ASME B16.1.
2) Class: 125
3) Flange face: [Flat].

c. Seat: Four Seat Plug.
d. Seats and Seat Rings: Monel.

1) Electrically fused to valve body.
2) Mating seat electrically fused to conical plug.

2. Valves:

a. Provide sleeve-type bearings.

1) Plug Bearings: Stainless Steel, ASTM A756

2) Minimum Bearing Compressive Strength: 2000 psi

b. Provide high strength 17-4PH stainless steel operating shaft.
c. Provide Chevron/V-type packing at shaft seal at head cover.
1) Allow for packing removal via stainless steel or manganese bronze packing gland.
2) Capable of being repacked after the valve is installed.
d. Provide mechanical stops on both ends of the operating mechanism to prevent over travel.

3. All valve components weighing more than fifty pounds shall be provided with lifting eye bolts.
4. Provide inspection opening ample in size to facilitate ease of inspection.
5. Covered access ports shall be provided for lubrication purposes.

D. Cone or Plug:

1. Material: Ductile iron; ASTM A536 Grade 65-45-12.
2. Configuration:

a. Full port plug type.
b. Conical.
c. Replaceable without removing valve from piping.

3. Trunnions:

a. Integrally cast.
b. Body & Head Cover Bushings: Bronze; ASTM B584.
c. Pivot Bearing: Bronze, ASTM B271/B271M.
d. Dowel or taper pin: AISI 420 stainless steel

E. Head Cover:

1. Materials:

a. Material: Ductile iron; ASTM A536 Grade 65-45-12.
b. Inner and Outer Seals: As recommended by manufacturer.

F. Design Criteria

1. Location: Main Equipment Building (B) El. 15.50
2. Application: Influent pump cone check valves
3. Tag #s: Pump #s P1-P6
4. Type of units: Self-contained, rotary actuators
5. Number of units: 6
6. Voltage/phase/HZ: 230V/3ph/60hz
7. Opening time: Between 10 and 30 seconds. Reference Section 406196 “Process Control Descriptions”.
8. Closing time:
a. Normal: Between 10 and 30 seconds, adjustable up to 180 seconds.
b. Loss of power: 10 seconds.
c. Reference Section 406196 “Process Control Descriptions”.

9. Rated torque output: (based on valve OEM)
10. Fail-safe Requirement: Fail closed on loss of power in approximately 10 seconds.
11. Manual override: Hand-pump/Handwheel/drill-drive
    a. All hand pump components shall be Type 316 stainless steel.
    b. A 2" nut shall also be provided to manually operate the valve via electric drill or in similar fashion.
    c. Any manual directional valve shall be stainless steel and/or bronze.
12. Cables and Tubing: 100 Feet or Less
13. Area Classification: Unclassified
14. Requirements for supports for the valves, actuators, piping, and accessories to be coordinated with the delegated design. See Section 400507 "Hangers and Supports for Process Piping".

G. Actuation:

1. Description: Lift, rotate, and lower valve.
2. Shaft and Guides Rods: Stainless steel, 17-4.
3. Linkage: Steel.
4. Lifting Nut: Bronze.
5. Valve Position Indicator:
    a. Include electric limit switches to indicate full valve closure and opening.
    b. Provide non-contact magnetostrictive linear position transducers integrated within the hydraulic cylinder or other approved equal technology to provide continuous feedback on valve position.
    c. Mechanical pointer shall be included on the valve to indicate the position of the valve plug at all times during plug rotation.

H. Actuator:

1. Electric-hydraulic actuator.
2. Provide as a complete assembly that includes a hydraulic actuator, electronics enclosures, motor drive, power supply, dedicated programmable microprocessor controller, field wiring terminals, interconnecting control components, door-mounted HMI, and cables connecting the aforementioned components.
3. Manufacturer:

    a. REXA,
    b. Dezurik,
    c. Or approved equal.

4. Speed: Refer to Design Criteria listed herein.
5. Finishes: manufacturer's standard.
6. Hydraulic Specifications:

    a. Consists of a linear, double-acting hydraulic cylinder connected to the cross head of the cone valve.
    b. Capable of being mounted as shown in the Contract Documents.
    c. Provide sufficient force throughout the entire stroke to overcome breakaway/seating friction and process dynamics.
    d. Design to operate at a standard internal hydraulic operating pressure of 2,000 psi, but will only generate the amount of internal psi required to transfer hydraulic

volume into force capable of overcoming the torque required to move the valve as required at any given moment.

e. Contains pressure limiting devices that allow the user to limit the internal pressure build-up of the hydraulics to 2,200-2,300 psi maximum, and field adjustable to lower values, in order to protect the internals of the hydraulics.

f. Hydraulic actuators that operate at a constant, standard internal pressure greater than 3,000 psi will not be accepted.

g. Actuator shall be rated for continuous-duty open-close and modulating service without restrictions on operating frequency, duty cycle, or number of starts and stops. Actuators requiring thermal cool-down periods or starts-per-hour limitations will not be accepted..

h. Hydraulic Fluid

1) The system shall be designed to use a premium grade; petroleum based hydraulic fluid with minimum flash point of 300 deg F. Hydraulic fluid shall be DTE 24 as manufactured by Exxon Mobil or approved equal. Design temperatures shall be 40 to 115 deg F. The oil shall contain oxidation and rust inhibitor and shall have excellent resistance to foaming with ready release of entrapped air. The hydraulic fluid shall provide a high level of wear protection for high-pressure, high-output hydraulic pumps and shall provide freedom from deposit formation.

2) The hydraulic fluid shall be specifically suited for use in conjunction with all components furnished as part of the hydraulic actuator in accordance with the recommendations of the manufacturers of the various equipment components.

3) The hydraulic fluid shall be as specified by the Hydraulic Power Unit manufacturer. The manufacturer shall submit a statement in writing that wetted parts of the hydraulic system are suitable for extended operation with the hydraulic fluid.

4) Hydraulic filtration to be provided where recommended by the actuator manufacturer.

i. Fail-Safe-Action – As defined below

1) Upon loss of primary power, the actuators shall fail-closed via a charged accumulator system. Accumulator will be dedicated to each valve application, isolated from the normal hydraulic circuit and only activated upon a fail-safe condition.

j. Manual Override: Means shall be provided to manually operate the cone valve in the event of loss of electrical power.

k. Employ a hydraulic circuit that is double-acting, transferring oil from one side of the operating cylinder to the other during normal operation.

1) Oil shall not be transferred to or removed from a reservoir when the actuator makes a position change.

2) Centralized hydraulics employing active reservoirs (used during normal operation) will not be acceptable.

3) Systems that use accumulator-based hydraulics for normal operation shall not be allowed: accumulators shall be used solely for fail-safe operation.

4) Spring-opposed based hydraulic systems will not be allowed.

l. The hydraulic power drive/module assembly must consist of a drive train apparatus containing a bi-directional gear pump and a hydraulic circuit regulating equal volumes of oil flow into and out of the hydraulic cylinder.

1) Provide dual action circuit, acting as a check valve in one direction and throttling valve for the hydraulic pump in the opposite direction.
2) The valves shall direct flow from the pump to cause the actuator to stroke in the direction indicated by the controller.

m. The hydraulic power drive/module assembly must also contain a motor that is directly coupled to the pump within the hydraulic manifold.

1) The motor shall only operate when a valve position change is required. Continuously running motors are not acceptable.
2) Motors shall be of a brushless servo or stepper motor design.
3) Induction motors will not be acceptable.

n. During normal operation, when the motor/pump is stopped, the hydraulic circuit must be closed, securely locking the actuator in place.

o. A pressurized oil expansion chamber integral to the hydraulic manifold with an indicator button to show oil level shall be provided as part of the hydraulic assembly.

1) The expansion chamber shall be isolated from the normal hydraulic circuit by suction check valves and only be used for thermal expansion and contraction of oil in the closed-loop system.
2) The expansion and contraction of oil in the closed-loop system.
3) The expansion chamber shall be under a minimum of 20 psi positive pressure to eliminate atmospheric ingress.
4) A thermostatically controlled cartridge heater shall be included in the hydraulic manifold assembly in order to maintain appropriate oil viscosity in the event ambient temperatures should fall below 40° F.
5) Heaters supplied are only allowed for the purposes of maintaining oil viscosity and shall not be employed as condensation heaters. Condensation heaters are not allowed.

p. Hydraulic seals shall be rated for ~ 1 million full stroke cycles (~ 10 million “dither” cycles defined as <1.0% step changes) before recommended replacement for preventative maintenance.

1) Hydraulic actuators designed for lower duty cycles with recommended seal upgrades for services less than 50,000 full stroke cycles are not allowed.

q. Hydraulic lines shall be hard piped with 316SS per ASTM A269. All tube fittings shall be 316SS. All tube connections shall be straight thread with an O-ring seal.

1) Hydraulic line design and routing shall be a designated design provided by the manufacturer.
2) Installation shall be done by Contractor.

7. Electrical Specifications

   a. Actuators shall be 230V 3ph power.

8. Quality Assurance

   a. The actuators specified under this Section shall be furnished by a single manufacturer with a minimum of 5 years of experience designing and manufacturing actuators in the North American municipal market. Assemble, test, and ship the actuator with the valve as a unit.
   b. The manufacturer shall show evidence of satisfactory operation of 5 separate installations of the same model actuators similar in size & scope, including emergency close functionality, that have been operating for 5 years minimum in a wastewater treatment plant.
   c. Installations that do not meet the minimum duration or that are from other industries will not be accepted as experience. References shall be given, upon request.
   d. Actuators must be supplied as a complete assembly from a single manufacturer, whereby said supplier has a dedicated manufacturing space & process within their facility for providing said product to the field.
   e. Documentation to prove out a dedicated manufacturing process for said product that has existed for 5+ years shall be provided.
   f. Actuators made solely of buy-out sub-assemblies that are not regularly assembled as part of a standard product offering by said supplier will not be accepted.
   g. The actuator must adhere to ANSI/ISA-96.06.01-2014.
   h. The actuator supplier must be ISO 9001 certified and provide documentation to confirm.
   i. Product manuals shall be provided during the submittal phase to confirm said product is a regularly manufactured system.

9. Coordination
   a. The cone valve manufacturer shall procure, mount, test, warranty and ship the cone valves and hydraulic actuators as a unit. The cone valve manufacturer will facilitate all start-up, training and support required for operation of the valve system. The valve manufacturer shall do all necessary coordination with the hydraulic actuator OEM necessary to accomplish this and shall provide the ability for a factory witness test of the valve./actuator.
   b. The cone valve manufacturer and actuator manufacturer shall both provide written confirmation that all torque requirements necessary for design and sizing of the actuator were coordinated. Report the maximum operator torque and maximum allowable stem/seating torques both with and without manufacturers' recommended safety factors in submittals.
   c. The cone valve and actuator manufacturers shall coordinate requirements for hardware to mount the actuator to the valve.
   d. The actuator shall be connected to the valve at the valve OEM, where the actuator will be used to move the valve for any required valve testing. The valve OEM shall not connect the actuator to the valve until a certified technician employed directly by the actuator manufacturer is on-site at the valve OEM to oversee the proper connection of the actuator to the valve. The actuator technician must be on-site for minimum of one full day for each valve.

e. The actuator OEM shall also send a technician to the installation site to oversee and commission the installation of the actuators. Start-up of these actuators shall not commence until the technician is on-site. The actuator technician must be on-site for minimum of one full day for each valve.

I. Finishes: As specified in Section 400551 "Common Requirements for Process Valves."

J. Accessories:

1. Fasteners: stainless steel.

2.2 SOURCE QUALITY CONTROL

A. Testing:

1. Hydrostatically test valve at twice rated pressure for 30 minutes without leakage.
2. Test valve according to AWWA C522.
3. Perform an operational test per AWWA C522.
4. Cone valve shall be pressure tested at 150 psig. The test pressure shall be maintained for a minimum of ten minutes. Acceptable hydrostatic test limits include the absence of visual external body leakage and the structural integrity of the valve body, plug, and associated mechanisms during all hydrostatic tests
5. Cone valve shall be pressure tested at the working pressure. Internal leakage past the closed valve with the working pressure applied alternately to either side of the plug shall not exceed 0.4 fluid ounce per minute per inch of nominal valve size per AWWA C522-22

B. Inspection: Ensure that body and plug seat properly when closed, and are drip tight per AWWA C522.

C. Owner Inspection:

1. Make completed valve assembly available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

D. Owner Witnessing:

1. Allow witnessing of factory inspections and tests at manufacturers' factories.
2. Notify Owner at least seven days before inspections and tests are scheduled.

E. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Thoroughly clean valve before installation.

B. Clean surfaces to remove loose rust, mill scale, and other foreign substances.

3.3 INSTALLATION

A. According to manufacturer instructions.

B. Dielectric Fittings: Provide between dissimilar metals.

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Inspection:

1. Inspect for damage to valve lining or coating and for other defects that may be detrimental as determined by Architect/Engineer.
2. Repair damaged valve or provide new, undamaged valve.
3. After installation, inspect for proper supports and interferences.

C. Pressure Testing: Pressure test valves with piping.

D. Conduct Functional and Acceptance Testing in conjunction with Section 432341 “End Suction Solids Handling Pumps”.

E. Manufacturer's Field Services: Furnish the services of a qualified representative of each of the various manufacturers as required herein.
1. Representatives shall inspect the installation of equipment, field test the equipment, make any necessary adjustments, field calibrate the equipment upon completion of the installation of each actuator and valve, and place it in initial operation. In addition, the representative shall instruct the operating personnel in the operation, calibration, trouble-shooting, and maintenance of the equipment.
2. Reports: Submit a report from the manufacturer of each visit to the site. Reports shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, training, instruction, and all other pertinent information.

F. Tests

1. After installation of the cone valve systems and all appurtenances, subject the units to a field running test under actual operating conditions as required herein and in the Contract Documents.
2. Test cone valves, and hydraulic cylinder actuators in accordance with the approved testing plan, and including the following. The field tests shall be witnessed by the engineer.
    a. Have each actuator open and close the valve through the full range of travel at least four times.
    b. Automatic switch to standby pump operation following duty pump failure.
    c. Emergency close in 10 seconds or less during loss of power.
    d. Demonstrate ability to operate the gate using the accumulator, hand pump or portable operator.
    e. The field tests shall demonstrate that all equipment, controls and monitoring operate as specified and within the allowable leakage rates.
    f. Field test the manual overrides to demonstrate that they can seat and unseat each cone valve

3.5 CLEANING

A. Keep valve interior clean as installation progresses.

B. After installation, clean valve interior of soil, grit, and other debris.

SECTION 400567.36 - PRESSURE-REGULATING VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Pressure-reducing valves for:

a. Seal water panel at Influent Pump Station.

B. Related Requirements:

1. Section 099679 “Atmospheric Protection and Plant Service Areas Coatings”: Coating and touchup of shop-primed surfaces with primer.
2. Section 400507 “Hangers and Supports for Process Piping”: Anchors and supports.
3. Section 400551 “Common Requirements for Process Valves”.
4. Section 400582 “Solenoid Valves for Process Service”

1.3 COORDINATION

A. Coordinate with installation of process piping and equipment connections as specified in other Sections and as indicated on Drawings.

1.4 SUBMITTALS

A. Comply with Section 400551 “Common Requirements for Process Valves”.

B. Product Data: Submit manufacturer catalog information.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

D. Manufacturer Instructions: Submit special procedures and setting dimensions.

E. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

F. Qualifications Statement:

1. Submit qualifications for manufacturer.

© 2026 CDM Smith
All Rights Reserved

1.5 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of pressure-regulating valves.

1.6 QUALITY ASSURANCE

A. Materials in Contact with Potable Water: Certified to NSF Standards 61 and 372.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' documented experience.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Section 400551 “Common Requirements for Process Valves”.

B. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

C. Store materials according to manufacturer instructions.

D. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Furnish temporary end caps and closures on piping and fittings and maintain in place until installation.
3. Provide additional protection according to manufacturer instructions.

1.9 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.10 WARRANTY

A. Furnish two-year manufacturer's warranty for pressure reducing valves.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 PRESSURE-REDUCING VALVES – Tag Type PRV

A. Manufacturers:

1. Ross Valve Manufacturing Co., Troy, NY (Series EP or Series T);
2. Golden Anderson Company (GA Industries), Mars, PA (Model 43-D);
3. Approved equal.

B. Description:

1. Normally open valves to maintain constant downstream pressure regardless of changing flow rate or varying inlet pressure.
2. Type: Direct acting, pressure balanced, spring-loaded, globe body.

C. End Connections:

1. Threaded, ASME B1.20.1.

D. Performance and Design Criteria:

1. Flow Rate:

a. Maximum: Per seal manufacturer.
b. Minimum: Per seal manufacturer.

2. Upstream Pressure:

a. Maximum: 110 psig.
b. Minimum: 60 psig.

3. Set Point Downstream Pressure:

a. Per seal manufacturer.
b. Range: Field adjustable from near zero to 110 percent.

E. Materials:

1. Body: Bronze or brass.
2. Seat: Buna-N or polyurethane.
3. Trim: Stainless steel.
4. Stem, Nut, and Spring: Bronze or stainless steel.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design and verify that new pipe and flanges mate properly.

3.2 PREPARATION

A. Thoroughly clean end connections before installation.

B. Close pipe and equipment openings with caps or plugs during installation.

C. Cleaning: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. According to manufacturer instructions and local code requirements.

B. Install with nameplate and test cock accessible.

3.4 FIELD QUALITY CONTROL

A. After installation, inspect for interferences and proper supports.

B. Testing:

1. Hydrostatic: Test each assembled valve, except control piping, hydrostatically at 1-1/2 times rated working pressure for minimum five minutes.
2. Leakage:

    a. Test each valve for leakage at rated working pressure against closed valve.
    b. Test Duration: Minimum 15 minutes.
    c. Permitted Leakage: Zero.

3. Perform functional test on each valve to verify specified performance.

C. Repair damaged coatings with material equal to original coating.

3.5 CLEANING

A. Keep interior of valves clean as installation progresses.

3.6 DEMONSTRATION

A. Demonstrate equipment startup, shutdown, routine maintenance, and emergency repair procedures to Owner's personnel.

END OF SECTION 400567.36

SECTION 400567.39 - PRESSURE-RELIEF VALVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Spring-loaded pressure-relief valves.
2. Note: Weight-loaded pressure-relief valves and hydrostatic pressure-relief valves will not be accepted.

B. Related Requirements:

1. Section 400551 – Common Requirements for Process Valves

1.3 COORDINATION

A. Section 013100 “Project Management and Coordination”: Requirements for coordination.

B. Section 013513.24 “Special Procedure for MOPO and Construction Sequence”

C. Coordinate Work of this Section with installation of influent pumps and piping.

1.4 SUBMITTALS

A. Section 013300 - Submittal Procedures: Requirements for submittals.

B. Section 400551 – Common Requirements for Process Valves.

C. Product Data: Submit manufacturer catalog information.

D. Shop Drawings: Indicate materials, size, accessories, and other details.

E. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

F. Manufacturer Instructions: Submit special procedures and setting dimensions.

G. Source Quality-Control Submittals: Indicate results of factory tests and inspections and provide required certifications.

H. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

I. Qualifications Statement:

1. Submit qualifications for manufacturer.

J. American Iron and Steel (AIS): Submit certification indicating compliance with AIS requirements.

1.5 CLOSEOUT SUBMITTALS

A. Section 017700 “Closeout Procedures”: Requirements for submittals.

B. Project Record Documents: Record actual locations of pressure-relief valves.

1.6 QUALITY ASSURANCE

A. Materials in Contact with Potable Water: Certified to NSF Standards 61 and 372.

B. Perform Work according to State, Local, and County standards.

C. Maintain one copy of each standard affecting Work of this Section on Site.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' documented experience.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Section 400551 – Common Requirements for Process Valves.

B. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

C. Store materials according to manufacturer instructions.

D. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Furnish temporary end caps and closures on piping and fittings and maintain in place until installation.
3. Provide additional protection according to manufacturer instructions.

© 2026 CDM Smith
All Rights Reserved

1.9 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.10 WARRANTY

A. Section 017700 “Closeout Procedures”: Requirements for warranties.

B. Furnish five-year manufacturer's warranty for pressure-relief valves.

PART 2 - PRODUCTS

2.1 PRESSURE-RELIEF VALVES, SPRING LOADED– Tag Type PRV2

A. Manufacturers:

1. DeZURIK APCO: Model 3000A
2. Golden Anderson: 624-D
3. Ross: SWR
4. Substitutions: Or Equal.

B. Description:

1. Size: As indicated on Drawings
2. Spring opposed, angle-pattern design with adjustable relief pressure and locking nut.
3. Performance and Design Criteria:

a. Flow Capacity: 4.3 mgd (estimated).
b. Open Pressure Setting: 40 psig.
c. Pressure Setting Available Range: 20 psig.
d. Closure time: 2 seconds minimum (adjustable).

4. Materials:

a. Body: Ductile Iron.
b. Trim: Type 316 stainless steel.
c. Spring: ASTM A125 steel and isolated from process flow.
d. Seat: EPDM, NPR.
e. Lining: Fusion-bonded epoxy.

5. End Connection: Flanged

2.2 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

B. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

3.2 PREPARATION

A. Thoroughly clean end connections before installation.

B. Cleaning: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. According to manufacturer instructions and local code requirements.

B. Repair damaged coatings with material equal to original coating.

C. Section 400551 – Common Requirements for Process Valves

D. Installation Standards: Install Work according to State, Local, and County standards.

3.4 FIELD QUALITY CONTROL

A. Testing: Test each valve for leak tightness at 75 percent of set point according to API 2000.

B. After installation, inspect for interferences and proper supports.

C. Repair damaged coatings with material equal to original coating.

3.5 CLEANING

A. Keep interior of valves clean as installation progresses.

3.6 DEMONSTRATION

A. Demonstrate equipment startup, shutdown, routine maintenance, and emergency repair procedures to Owner's personnel.

SECTION 400576 – HOT TAPPING VALVES AND LINE STOPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes

1. Hot-tapping in-service pipelines.
2. Temporary and permanent line stopping/plugging pipelines.
3. Delegated design.

B. Related Requirements:

1. Section 013513.24 for “Special Procedure for MOPO and Construction Sequence”
2. Section 015000 for “Temporary Facilities and Controls”
3. Section 017419 for “Construction Waste Management and Disposal”
4. Section 024119 for “Selective Demolition”

1.3 SCOPE OF WORK

A. This section covers the mandatory requirements for hot tapping and line stopping (plugging) on pipelines that cannot be removed from service or have construction sequencing constraints that require hot tapping the pipeline during construction. An installation narrative and detailed sequence of construction is described in the following paragraphs. More detailed descriptions of the field installation requirements are included in Part 3.

B. In the text that follows, a “tapping valve” shall be defined as the gate valve that will remain in the line after the work of this section is complete.

C. Preparation and installation of equipment and materials for line stopping shall be in accordance with the Sequence of Construction specified in Section 013513.24, Special Procedures for Maintenance of Plant Operation and Sequence of Construction. Installation of line stopping shall be weather constrained as defined in Specification Section 013513.24.

D. Hot tapping and line stopping shall be used to temporarily plug the existing 48-inch cast iron/ductile iron discharge headers for the influent pumps at two locations, as shown on the drawings, to facilitate removal of the existing pumps, piping, and valves and installation of new pumps, piping, and valves. The two hot taps and line stops will be conducted at separate times, in accordance with Specification Section 013513.24.

E. While they are in place, line stops at each location shall be monitored 24/7 by the Line Stop Contractor.

F. The pipeline locations to be tapped and plugged are in the lower level of the Main Equipment Building Influent Pump Station. The Contractor shall field verify the existing clearances and identify/confirm any other room and equipment dimensions and distances required for preparing an installation plan for hot tapping and line stopping. It is preferred that the tapping equipment be located in the lower level of the influent pump station. The results of the field verification shall be submitted to the Engineer.

G. It is part of the responsibilities of the Contractor to field verify the outside diameter of the existing pipe, and any ovality, or other abnormal dimensional characteristics measured in the pipe, that must be accounted for in the design and fabrication of the hot tap/line stop fitting. The results of the field verification shall be submitted to the Engineer.

H. Prior to performing any work, the Contractor shall determine the wall thickness of the existing cast iron or ductile iron pipe at the tap locations by using ultrasonic testing as described in Section 3.01.A. The results of the testing shall be submitted to the Engineer.

I. The line-stop shall be accomplished utilizing a powered mechanical tapping and plugging system. The system shall consist of a line stop fitting, to be attached to the pipeline, until the pipeline is demolished; gate valve and blind flange cover; sandwich-style temporary tapping gate valves; a powered wet tapping machine; adapter head having the proper joint configuration required to mate with the tapping valve; The line stop shall be accomplished using an inflatable plug system with launch cylinder and inflation ram. The components of the hot tapping and line stopping system shall be designed for a pipeline operating pressure of 35-psi.

J. Tapping machine shell cutters and coupon-retaining pilot drills shall be fitted with removable or permanently-mounted carbide teeth, each installed specifically for this project, having a sharp durable edge. The shell cutter and teeth shall be treated with cutting lubricant to permit efficient cutting and removal of the pipe coupon without binding or seizing. The wet tap operation shall permit the continuous operation of the existing pumping units during the removal of the pipe coupon.

K. All temporary valves, piping, couplings, dewatering, coring, rigging and other necessary work required for successful plugging of the pipeline shall be furnished and installed by the Contractor.

1.4 PRESINSTALLATION MEETINGS

A. Retain "Preinstallation Conference" Paragraph below if Work of this Section is extensive or complex enough to justify a conference.

B. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include detail drawings, material descriptions, dimensions of individual components and profiles, and finishes for all components.
2. Include design pressure rating of the line stop fitting, tapping machine, and line stop equipment.

B. Shop Drawings:

1. Indicate existing pipelines.
2. Indicate proposed installation of the line stop.

    a. Indicate proposed method of supporting existing pipeline if required.

3. Installation plans.

    a. Step-by-step description of installation of tapping and line-stop fittings.
    b. Detailed procedures for inserting, maintaining, and removing line-stops.

4. Certification indicating the design pressure rating of the line stop fitting, tapping machine, and line stop equipment.

C. Product Schedule: For.

1. (2) 48” x 18” bolt-on line stop fitting
2. (2) 18” taps and tapping valves for line stop
3. (2) single line stops on (2) 48” cast iron, screened wastewater lines
4. (2) 8-12” valves for draining and re-filling the forcemains
5. Any additional items required for a fully installed system not mentioned here.

1.6 DELEGATED DESIGN SUBMITTALS

A. Delegated-Design Submittal: For Line Stops; Section 014000 “Quality Requirements” for additional delegated design requirements.

B. Qualifications Statement: Submit qualifications for licensed professional.

1.7 QUALIFICATIONS

A. The Contractor shall employ a specialty subcontractor to perform the wet tap and line stop work. Subcontractor must have demonstrated experience of 10 years with tapping and line stopping work and provide a detailed reference list including at least five (5) successfully performed minimum 18 inches diameter hot taps on a minimum 48” cast iron or ductile iron pipe, including line plugging of pipe, performed under a pressure of 50 psi. The subcontractor’s qualifications including at least 5 projects of similar size pipe, pipe material and complexity must be submitted for approval prior to proceeding with the initiation of any portion of this work. This is also a requirement of the bid.

1. Field Technician Qualification

    a. Hot Tap – Field Technician Qualifications: Hot tap technician actually operating the machinery shall have, as a minimum, a three (3) year continuous employment

history with the Subcontractor and have performed at least 2 hot taps on similar size pipe and pipe material. Subcontractor shall be required to furnish employment history for this technician along with a safety and other operational training summary. In no case shall a technician without proper supporting documentation and qualifications be permitted to work on the job site.

b. Hot tapping field technicians must have as a minimum:

1) 40 hours HAZWOP safety training
2) 10 hours OSHA construction training
3) Technician's safety training records must be provided to the Engineer prior to the start of field operations

2. Field Performance Qualifications

a. Subcontractor must have demonstrated experience of 10 years with tapping and line stopping work and provide a detailed reference list including at least five (5) successfully performed minimum 18 inches diameter hot taps on a minimum 48" cast iron or ductile iron pipe, including line plugging of pipe, performed under a pressure of 50 psi.

b. Reference List Must Include:

1) Project owner for whom the Work was performed
2) Contact name, phone number and email address
3) Date of the field operation
4) Location of the field operation
5) Header size of the operation
6) Operating pressure of the operation
7) Operating temperature of the operation
8) Product used

1.8 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Line Stops and hot-tapping valve assemblies, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

B. Qualification Data: For manufacturer.

C. Retain "Welding certificates" Paragraph below if retaining "Welding Qualifications" Paragraph in "Quality Assurance" Article.

D. Product Certificates: For each type of assembly.

E. Requirements in first paragraph below are for test reports for products on which tests are performed either by independent testing agencies or by manufacturers in their own labs. Retain first option if testing is likely to be performed in manufacturer's facilities and witnessed by a qualified testing agency; retain second option if testing is performed by the testing agency.

F. Retain "Preconstruction Test Reports" Paragraph below if specifying preconstruction testing in "Preconstruction Testing" Article as Contractor's responsibility.

G. Source quality control reports.

H. Field quality control reports.

I. Sample Warranty: For manufacturer's warranty.

1.9 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For hot-tapping valve to include in operation and maintenance manuals.

1.10 QUALITY ASSURANCE

A. Delegated Design Engineer: Licensed professional engineer experienced in design of specified Work and licensed in the jurisdiction of the project location.

B. Retain one of two "Installer Qualifications" paragraphs below.

C. Installer Qualifications: Employ a specialty subcontractor to perform the wet tap and line stop work.

D. Section 014000 "Quality Requirements" covers general requirements for testing agency qualifications including defining "NRTL" and "NVLAP." Retain one of two "Testing Agency Qualifications" paragraphs below if referring to standard specifications and practices that focus directly on the kinds of materials and testing involved.

E. Retain "Welding Qualifications" paragraphs below if shop or field welding is required. If retaining, also retain "Welding certificates" Paragraph in "Informational Submittals" Article.

F. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code – Steel."

G. Pipe and Pressure-Vessel Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Do not disassemble factory assembled parts and components for shipment unless written permission received from Engineer.

B. Inspection: Accept materials on Site in Manufacturer’s original packaging and inspect for damage. As necessary, provide inspection report to Manufacturer identifying any damage and rework necessary prior to installation.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Provide additional protection according to Manufacturer’s instructions.

3. Protect unpainted finished iron and steel surfaces to prevent rust and corrosion.
4. Protect finished surfaces of exposed flanges with wood or equivalent blank flanges.
5. Protect bearings against formation of rust in accordance with bearing manufacturer's recommendations. Apply lubricant or corrosion inhibiting treatment during transportation, storage, handling, installation, and lapse of time prior to start-up. Intermittently manually rotate equipment prior to start-up to ensure distribution of lubricant/protection.

D. Retain this article only if providing detailed requirements that apply to Work of this Section and that supplement general provisions in Division 01.

1.12 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace each line-stop permanent assembly that fail(s) in materials or workmanship within specified warranty period.

1. Warranty Period: 3 year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, provide one of the following:

1. JS Barry Industries, Manchester, NH.
2. TDW Services, Inc., Tulsa, OK.
3. Or an approved equal.

B. Initial Investigations

1. Prior to the placement of material orders for this portion of the project, the Contractor will be required to obtain certain job site data to facilitate the proper manufacture of components needed to complete the work of this section on an operating outfall pipe under pressure.

    a. All job site data listed herein and required by the contractor to perform the work of this section will be submitted to the Engineer a minimum of 90 days prior to the required mobilization of the specialty fittings, equipment, and tapping and line stop technicians to the work site. The Engineer will review the required data and return approved documents to the General Contractor within 30 calendar days.
    b. Prior to fabrication of materials required for the hot tapping and/or line stopping process, the contractor will perform field investigations to determine, the actual conditions of the existing cast iron pipe at the location where the work is to take place and to develop the tapping and line plugging plan and implement the plan.

C. Steel Reinforcing Tapping Saddles for Welded Steel Branches

1. Provide reinforcing saddles for tapping saddles where access is limited.

2. Tapping branches 3-inch diameter and larger to be per ASTM A324, WPD carbon steel reinforcing saddles and meet the requirements of ASME B31.3 and MSS-SP-97.

D. Resilient Wedge Tapping Valves

1. Construct the reinforcing saddles of A106, Grade B or ASTM A516 Grade 70 forged steel.
2. Provide valves that meet the requirements of AWWA C509 or AWWA C515
3. Provide iron body, solid resilient wedge gate.

    a. Compose valve body, bonnet, stuffing box, and disc of grey iron or ductile iron.
    b. Provide stainless steel bolts and nuts for the stuffing box and bonnet.
    c. Working water pressure: 150 PSI minimum.
    d. Flanged valves:

        1) Face-to-face dimension per ANSI B16.10
        2) Flanges per ANSI B16.1

4. Non-rising stem gate valves:

    a. Provide stems made of bronze or stainless steel.
    b. Provide at least one thrust washer above and below the stem collar to reduce operating torque.
    c. Factory lubricate thrust collar.
    d. Use permanent lubricant for long term ease of operation.
    e. Provide O-ring sealed stuffing box, one ring below and two rings placed above the stem thrust collar.
    f. Isolate thrust collar and o-rings from waterway and outside contamination.
    g. Design non-rising stem such that if excessive input torque is applied, stem failure occurs above the stuffing box at such a point as to enable the operation of the valve with a pipe wrench or other readily available tool.
    h. Fully encapsulate valve wedge and guide lugs in rubber material.
    i. Provide cast iron hand wheel with permanent labeling of “OPEN” and an arrow showing opening direction counter-clockwise.
    j. Coat valve interior and exterior ferrous surfaces with fusion bonded epoxy per AWWA C550.
    k. Hydrostatically test all valve bodies to twice the rated working water pressure.
    l. Seat test valves bi-directionally at the rated working pressure.

        1) Seat leakage not to exceed one fluid ounce per inch of valve diameter per hour.

5. Determine if valves specified have a bore large enough to accept the shell cutters for the tapping machine.
   Fire-test-response characteristics in first two paragraphs below are generally included to ensure compliance with regulatory requirements. Place characteristics here if they are applicable to all products in this Section and their performance, once installed, is part of a fire-rated assembly. Place characteristics in individual product descriptions if each product has different characteristics and performance, or locate overall criteria, including test methods and listing requirements, here and product-specific performance values in

each product description. Never use terms such as "fire-hazard classification" or others implying some degree of fire-risk assessment.

E. Bolts and Nuts

1. Flange nuts.

a. Manufactured of ASTM A194 grade 2H steel.
b. Course thread, class 2A fit per ANSI B16.2.
c. Square or hexagonal dimensions per ANSI B18.2.1.

2. Flange bolts.

a. Install using nickel anti-seize compound.
b. Degrease of protective oils and excess anti-seize compound prior to field application of coating system.

F. Non-Insulation Flange Gaskets

1. Compressed non-asbestos aramid fiber.

a. 1/8 inch thick.
b. Ring-type configuration with interior and exterior dimension as required by pipe size.
c. Adhesive-backed gaskets are acceptable.

G. Insulation Flange Gaskets and Accessories

1. Dielectric insulating gaskets.

a. Furnish as kit, including:

1) Dielectric gasket.
2) Mylar bolt sleeves with a dielectric strength of 4000 volts/mil minimum.
3) Phenolic resin insulating washers with a dielectric strength of 400-500 volts/mil

b. Install where flanged joints transition from steel to ductile or gray iron.
c. Install where exposed piping transitions to buried piping.
d. Install as shown on Drawings.

2. Insert requirements for mill testing and inspecting for compliance with specified fabrication tolerances.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Perform an initial field inspection of the pipe under the supervision of the Engineer to verify the location of the line stop.

© 2026 CDM Smith
All Rights Reserved

B. Determine the condition of the existing pipeline and exact dimensions (outside diameter, ovality, wall thickness, or other abnormal dimensional characteristics) prior to shop fabrication of the line stop fitting. Accurate measurement of the pipe dimensions may require insulation and lead paint removal.

C. On steel, gray, cast iron, and ductile iron pipe, verify the actual thickness of the pipe wall at the location of the tap by ultrasonic thickness testing.

1. Testing to be performed by an ASNT Level II NDE Inspector.

D. Contractor to provide either 3/76/230 or 3/38/480 electrical supply within 50 ft of electric/hydraulic unit placement and electric/hydraulic unit must be located within 50 ft of tap location.

E. Contractor to confirm pipe sizing, material, and classification.

F. The contractor is responsible for ensuring the bolt-on line stopping fitting (to remain on the line) meet any applicable code requirements.

G. The contractor is to supply man-lift/staging to reach line stopping locations.

H. Contractor to provide rigging/assistance for all tapping/line stopping equipment from the service vehicle to the tapping location, mounting of the tapping/line stopping equipment at the job location, and back to the service vehicle when the project is complete.

I. Contractor to provide any support/reinforcement to existing piping to support total weight of fitting/equipment/valve.

J. Contractor to provide support for line stopping equipment while it is in use (supporting the neck of the fitting and/or launch cylinder)

K. Contractor to backfill/equalize pressure on the drain side of the line after work is complete and prior to flow being reinitiated within the system.

L. Valve placement needs to take place on a section of pipe free of any welds, joints, fittings, etc. It is not recommended to perform a tap over an existing weld on a pipe (damage to the pipe and tapping machinery can occur).

M. Contractor to provide 110V/15Amp electricity and ½” water supply within 100 feet of tapping/line stopping locations.

N. Contractor to provide a controlled means to drain and verify the effectiveness of the intended outcome of the line stop(s).

O. Contractor to confirm there is no leakage in the drain side of the pipeline prior to disassembling the pipe. Contractor to provide a means to control any leakage through the line stop once the drain side of the line pipe is disassembled.

© 2026 CDM Smith
All Rights Reserved

3.2 INSTALLATION

A. Install line stop as indicated by manufacturer. If fitting is installed by welding, notify the Engineer at least 48-hours prior to performing the work to allow time to schedule NDE examination of welds by Owner's inspection consultant.

1. While in place, monitor line stops 24 hours a day until the pipe is ready to be put back in service, before removal.
2. After the tapping saddle is successfully inspected and prior to the installation of the tapping valve, conduct a leakage test using the 1-in diameter outlet connection included in the nozzle section of the hot tap/line stop fitting.
3. Carry out the leakage test using water at a pressure of 40 psi for ½ hour.

    a. Notify the Engineer prior to allow witness of the leakage test.

B. After a successful leakage test, install the tapping valve and tapping machine.

C. Design the tapping machine cutting components (shell cutter and pilot drill) to provide a clean cut at the pipe wall, and retain the cut coupon for removal.

D. Upon approval from the Engineer, perform the tap and withdraw the cutter.

SECTION 400578.21 - AIR RELEASE VALVES FOR WASTEWATER SERVICE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Air release valves for wastewater treatment facilities.

B. Related Requirements:

1. Section Manufacturer’s standard: Preparing, priming, and painting surfaces, including field-applied and equipment finishing.
2. Section 400507 “Hangers and Supports for Process Piping”: Anchors and supports.
3. Section 400551 “Common Requirements for Process Valves”: Typical product and installation requirements for valves specified in this Section.
4. Section 404213 “Process Piping Insulation”: Insulation applied to process piping systems.

1.3 COORDINATION

A. Coordinate Work of this Section with installation of process piping.

1.4 PREINSTALLATION MEETINGS

A. Section 400551 “Common Requirements for Process Valves”.

1.5 SUBMITTALS

A. Product Data: Submit manufacturer catalog information.

B. Shop Drawings: Indicate on assembly drawings materials, dimensions, weights, and end connections.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

D. Manufacturer Instructions: Submit special procedures and setting dimensions.

E. Source Quality-Control Submittals: Indicate results of tests and inspections and provide required certifications.

F. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

G. Manufacturer Reports: Certify that equipment has been installed according to manufacturer instructions.

H. Qualifications Statements:

1. Submit qualifications for manufacturer and installer.
2. Submit manufacturer's approval of installer.

I. American Iron and Steel (AIS): Submit certification indicating compliance with AIS requirements.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of air release valves.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' experience.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Furnish temporary end caps and closures on piping and fittings and maintain in place until installation.
3. Provide additional protection according to manufacturer instructions.

1.9 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.10 WARRANTY

A. Furnish standard manufacturer's warranty for air release valves.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 AIR RELEASE VALVES FOR WASTEWATER SERVICE – Tags ARV-0050-1 through ARV-0050-6

A. Manufacturers:

1. DeZURIK (APCO) 4” Model 400
2. Or Equal.

B. Description:

1. Stems and Bodies: Long-float type to minimize clogging.
2. Small orifice assembly air release valves shall automatically release air accumulations from pipe while under positive pressure. When valve body fills with air, float mechanism shall fall to open small orifice and exhaust air to atmosphere. When air has been exhausted, float mechanism shall be buoyed up and shall tightly close small orifice.
3. Shall be specifically designed for grit and sewage service.
4. Air release valves shall be supplied with shutoff ball valves.

C. Materials:

1. Body and Cover: Type 316 Stainless steel or Ductile iron, ASTM A536
2. Float: Type 316 stainless steel
3. Seat: Buna-N
4. Internal Trim: Type 316 stainless steel
5. Hardware: Type 316 stainless steel

D. Normal Working Pressures: See minimum operating pressure and design pressure on valve schedule in Drawings.

1. Provide softer durometer seats as necessary to prevent leakage.

E. Pressure Rating: 150 psig.

F. Minimum Orifice Diameter: 5/16”

G. Size: As indicated on Drawings.

H. End Connections:

1. Size 1/2 to 3 Inches: Threaded.
2. Size 4 Inches and Larger: Flanged.

I. Backflush kit for each valve:

1. Minimum 2 brass shut-off valves
2. Minimum 5 feet of hose with galvanized steel quick disconnects
3. 316 stainless steel piping sized pursuant to manufacturer recommendations of sufficient length for flushing inlet and outlet quick connections to reach within 5 feet above the finished floor or grating below

2.2 FINISHES

A. Prepare piping appurtenances for field finishes as specified in Manufacturer’s standard.

2.3 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

B. Owner Inspection:

1. Make completed air release valve assembly available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If fabricator is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at fabricator's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved fabricator.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolthole configurations or design, and verify that new pipe and flanges mate properly.

3.2 PREPARATION

A. Thoroughly clean end connections before installation.

B. Close pipe and equipment openings with caps or plugs during installation.

C. Cleaning: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. According to manufacturer instructions.

B. Provide access for operation, removal, and maintenance, and to avoid discharge to occupied areas or other equipment.

C. Vent the valve properly and pipe outlet to nearest drain or as directed by the Engineer.

3.4 FIELD QUALITY CONTROL

A. Inspect for interferences and proper supports.

B. Testing:

1. As specified in Section 400551 “Common Requirements for Process Valves”.
2. Demonstrate operation without undue noise or vibration.

C. Manufacturer Services: Furnish services of manufacturer's representative experienced in installation of products furnished under this Section for not less than eight hours on Site for installation, inspection, startup, field testing, and instructing Owner's personnel in operation and maintenance of equipment.

D. Equipment Acceptance:

1. Adjust, repair, modify, or replace components failing to perform as specified and rerun tests.
2. Make final adjustments to equipment under direction of manufacturer's representative.
3. Repair damaged coatings with material equal to original coating.

E. Furnish installation certificate from equipment manufacturer's representative attesting that equipment has been properly installed and is ready for startup and testing.

3.5 CLEANING

A. Keep interior of air release valves clean as installation progresses.

3.6 DEMONSTRATION

A. Demonstrate equipment startup, shutdown, routine maintenance, and emergency repair procedures to Owner's personnel.

SECTION 400578.29 - COMBINATION AIR VALVES FOR WASTEWATER SERVICE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Combination air valves for wastewater treatment facilities.

B. Related Requirements:

1. Manufacturer’s standard: Preparing, priming, and painting surfaces, including field-applied and equipment finishing.
2. Section 400507 “Hangers and Supports for Process Piping”: Anchors and supports.
3. Section 400551 “Common Requirements for Process Valves”: Typical product and installation requirements for valves specified in this Section.
4. Section 404213 “Process Piping Insulation”: Insulation applied to process piping systems.

1.3 ADMINISTRATIVE REQUIREMENTS

A. Coordination

1. Section 013100 “Project Management and Coordination”: Requirements for coordination.
2. Coordinate Work of this Section with installation of process piping.

B. PREINSTALLATION MEETINGS

1. Section 400551 ”Common Requirements for Process Valves”.

1.4 ACTION SUBMITTALS

A. Shop Drawings: Indicate materials, dimensions, weights, and end connections on assembly drawings.

1.5 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

B. Product Data: Submit manufacturer catalog information.

C. Manufacturer Instructions: Submit special procedures and setting dimensions.

D. Source Quality-Control Submittals: Indicate results of tests and inspections.

E. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections and provide required certifications.

F. Manufacturer Reports: Certify that equipment has been installed according to manufacturer instructions.

G. Qualifications Statements:

1. Submit qualifications for manufacturer and installer.
2. Submit manufacturer's approval of installer.
3. American Iron and Steel(AIS): Submit certification indicating compliance with AIS requirements.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of combination air valves.

1.7 QUALITY ASSURANCE

A. Manufacturer Quality Management System: Certified to ISO 9001.

1.8 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum five years' experience.

B. Installer: Company specializing in performing Work of this Section with minimum five years' experience.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Furnish temporary end caps and closures on piping and fittings and maintain in place until installation.
3. Provide additional protection according to manufacturer instructions.

© 2026 CDM Smith
All Rights Reserved

1.10 FIELD CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.11 WARRANTY

A. Furnish five-year manufacturer's warranty for all air valves.

PART 2 - PRODUCTS

2.1 COMBINATION AIR VALVES FOR WASTEWATER SERVICE – Tag Type CAV

A. Manufacturers:

1. DeZURIK (APCO) 4” Model 440
2. Or Equal.

B. Description:

1. Type:

a. Fully automatic, float operated.
b. Body: Single.
c. Throttled.

2. Comply with AWWA C512.
3. Size: As indicated on Drawings.
4. Suitable for sewage service.
5. Normal Working Pressures: See minimum operating pressure and design pressure on valve schedule in Drawings.

a. Provide softer durometer seats as necessary to prevent leakage.

6. Pressure Rating: 150 psig
7. Minimum Orifice Diameter: 7/32”
8. Combination air valves:

a. Perform the functions of an air/vacuum valve (exhaust large quantities of air on start-up, admits air on shut-down) and air release valves (release air continuously during operation) to maintain system efficiency and prevent pipeline surges.

C. Materials:

1. Body and Cover: Type 316 Stainless steel or Ductile iron, ASTM A536.
2. Float: Type 316 stainless steel.
3. Seats: Buna-N.

4. Seals: Buna-N.
5. Hardware: Stainless steel

D. End Connections - Single Body:

1. Size 4 Inches and Smaller:

a. Threaded, NPT.
b. 1-Inch Valves: Furnish 2-inch inlet.
c. Engineer approved equal.

2. Size 4 Inches and Larger: Flanged, ASME B16.1.

a. Engineer approved equal.

E. Backflush kit for each valve:

1. Minimum 2 brass shut-off valves
2. Minimum 5 feet of hose with galvanized steel quick disconnects
3. 316 stainless steel piping sized pursuant to manufacturer recommendations of sufficient length for flushing inlet and outlet quick connections to reach within 5 feet above the finished floor or grating below

2.2 VACUUM BREAKER/AIR RELEASE VALVE – Tag Type VBV and Tags ARV-0056-1 through ARV-0056-4:

A. Manufacturers:

1. DeZURIK (APCO) Model 4” 1500A/2” 400 ARV.
2. Val-Matic Valve & Manufacturing Corp Model 4” 1804VBS /2” 48A.
3. Substitutions: As specified.

B. Description:

1. Type:

a. VB with center guided spring loaded disc.

1) Spring shall be designed to withstand 100,000 cycles without failure.
2) Valve shall open when a vacuum/pressure differential exceeds 0.25 psi.

b. SARV Fully automatic, float operated.
c. Body: Dual.

2. Size: 4” VBV and 2” SARV.
3. Suitable for sewage service.
4. Normal Working Pressures: See minimum operating pressure and design pressure on valve schedule in Drawings.

a. Provide softer durometer seats as necessary to prevent leakage.

5. Minimum Orifice Diameter: 3/16”
6. Pressure Rating: 150 psig.
7. Maximum Operating Temperature: 180 degrees F.
8. Vacuum breaker valves shall perform the functions of an air inlet valve upon vacuum (admits large quantities of air upon vacuum condition) and air release valves (release air continuously during operation) to maintain system efficiency and prevent pipeline surges.

C. Materials:

1. Body and Cover: Type 316 Stainless Steel or Ductile Iron.
2. Float: Type 316 Stainless steel.
3. Seats: Buna-N.
4. Seals: Buna-N/Nitrile.
5. Trim: Stainless steel.
6. Hardware: Stainless steel.

D. End Connections:

1. Size 1/2 to 3 Inches: Threaded.

2. Sizes 3 inches and larger: Flanged, ASME B16.1.

E. Backflush kit for each valve:

1. Minimum 2 brass shut-off valves
2. Minimum 5 feet of hose with galvanized steel quick disconnects
3. 316 stainless steel piping sized pursuant to manufacturer recommendations of sufficient length for flushing inlet and outlet quick connections to reach within 5 feet above the finished floor or grating below

F. Accessories:

1. Accessories, including inlet shutoff valve.
2. Epoxy lining.

2.3 INSULATION

A. As specified in Section 404213 “Process Piping Insulation”.

2.4 FINISHES

A. Prepare piping appurtenances for field finishes as specified by manufacturer’s standard.

2.5 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

B. Owner Inspection:

1. Make completed air release valve assembly available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and test at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If fabricator is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at fabricator's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved fabricator.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field dimensions are as indicated on Shop Drawings.

B. Inspect existing flanges for nonstandard bolt hole configurations or design and verify that new pipe and flanges mate properly.

3.2 PREPARATION

A. Thoroughly clean end connections before installation.

B. Close pipe and equipment openings with caps or plugs during installation.

C. Cleaning: Clean surfaces to remove foreign substances.

3.3 INSTALLATION

A. According to manufacturer instructions.

B. Provide access for operation, removal, and maintenance, and to avoid discharge to occupied areas or other equipment.

C. Vent the valve properly and pipe outlet to nearest drain or as directed by the Engineer.

3.4 FIELD QUALITY CONTROL

A. Inspect for interferences and proper supports.

B. Testing:

1. As specified in Section 400551 “Common Requirements for Process Valves”.
2. Demonstrate operation without undue noise or vibration.

C. Manufacturer Services: Furnish services of manufacturer's representative experienced in installation of products furnished under this Section for not less than eight hours on Site for installation, inspection, startup, field testing, and instructing Owner's personnel in operation and maintenance of equipment.

D. Equipment Acceptance:

1. Adjust, repair, modify, or replace components failing to perform as specified and rerun tests.
2. Make final adjustments to equipment under direction of manufacturer's representative.
3. Repair damaged coatings with material equal to original coating.

E. Furnish installation certificate from equipment manufacturer's representative attesting that equipment has been properly installed and is ready for startup and testing.

3.5 CLEANING

A. Keep interior of air release valves clean as installation progresses.

3.6 DEMONSTRATION

A. Demonstrate equipment startup, shutdown, routine maintenance, and emergency repair procedures to Owner's personnel.

SECTION 400582 - SOLENOID VALVES FOR PROCESS SERVICE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Solenoid valves for process applications.

B. Related Requirements:

1. Section 400551 “Common Requirements for Process Valves”: Basic materials and methods related to valves commonly used for process systems.
2. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.3 COORDINATION

A. Coordinate Work of this Section with process piping Work as specified in other Sections and as indicated on Drawings. Note that solenoid valves may be shown on Electrical and/or Mechanical Drawings, or may only be specified, but provide if so specified or shown. Provide solenoid valves located in hazardous classified areas with electrical enclosures which satisfy the electrical classification as specified or shown on the electrical drawings.

1.4 ACTION SUBMITTALS

A. Product Data: Submit manufacturer information, indicating materials of construction, wiring diagrams, and compliance with indicated standards.

B. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

1.5 INFORMATIONAL SUBMITTALS

A. Manufacturer Instructions: Submit detailed instructions on installation requirements, including storage and handling procedures.

B. Source Quality-Control Submittals: Indicate results of factory tests and inspections.

C. Field Quality-Control Submittals: Indicate results of Contractor-furnished tests and inspections.

D. Qualifications Statement:

1. Submit qualifications for manufacturer.

1.6 QUALITY ASSURANCE

A. Materials in Contact with Potable Water: Certified to NSF 61 and NSF 372.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' documented experience.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

B. Store materials according to manufacturer instructions.

C. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Provide additional protection according to manufacturer instructions.

1.9 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.10 WARRANTY

A. Section 017700 “Contract Closeout”: Requirements for warranties.

B. Furnish one-year manufacturer's warranty for solenoid valves.

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 SOLENOID VALVES (SLOW CLOSING) – Tag Type SV

A. Manufacturers:

1. ASCO Valve Inc., Division of Emerson Industrial Automation, Florham Park, NJ (ASCO Series 8210).
2. Versa Products Company, Paramus, NJ (Series V and T).
3. Fluid Controls Division, Parker Hannifin Corporation, New Britain, CT (Gold Ring Series 22, 23, 24, and 28).

B. Description:

1. Type: Two-position, two-way pilot-operated slow closing solenoid valves.
2. Valve body: Equipped with a pilot and bleed orifice, which uses the line pressure to lift and lower the diaphragm for opening and closing the valve.
3. Snubber: Included to slow the disc closing speed and reduce water hammer as classified in FCI 82-1.

C. Materials:

1. Valve body: ASTM B584 high-strength yellow brass with female NPT threaded connections in accordance with ASME B1.20.1.
2. Seals and discs: NBR rubber and polytetrafluoroethylene (PTFE).
3. Core tube and springs: ASTM A276, Type 305 stainless steel.
4. Piston: Stainless steel or brass, manufacturer’s standard alloy.
5. Body assembly cap screws: Type 316 stainless steel.

D. Solenoids:

1. One-piece molded epoxy design.
2. Operate on 120V, 60Hz/110V, 50Hz power, unless otherwise scheduled and have a continuous duty rating regardless of the application.
3. Meet the requirements of NEMA ICS 6, and have a “General Use” listing in the UL Gas and Oil Equipment Directory; and/or the UL Hazardous Location Equipment List.
4. Solenoids scheduled with Type 4X enclosure rating (watertight, corrosion resistant): As defined in NEMA 250, as a minimum. Furnish Type 4X solenoids with “Hirschman” style pinned connectors in accordance with DIN 43650.
5. Solenoids installed in spaces requiring a Type 7 rating in accordance with NEMA 250: Meet the requirements of UL 698 and/or UL 1002, and the requirements of this Section.
6. Insulation:

    a. NEMA Class F insulation for ambient temperatures up to 125 degrees F. Ensure process fluid temperatures used with valves having NEMA Class F insulation does not raise the surface temperature of the solenoid coil in excess of 300 degrees F.
    b. NEMA Class H insulation for temperatures up to 140 degrees F. Ensure process fluid temperatures used with valves having NEMA Class H insulation does not raise the surface temperature in excess of 350 degrees F.

All Rights Reserved

2.2 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

PART 3 - EXECUTION

3.1 INSTALLATION

A. As specified in Section 400551 “Common Requirements for Process Valves”.

B. Install protective strainers upstream of solenoid valves, pressure-reducing valves, and pressure-sustaining valves.

3.2 FIELD QUALITY CONTROL

A. As specified in Section 400551 “Common Requirements for Process Valves”.

END OF SECTION 400582

SECTION 400593.13 - MEDIUM-VOLTAGE MOTOR REQUIREMENTS FOR PROCESS EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes medium-voltage, three-phase motors for application on equipment provided under other Sections.

B. Manufacturer of driven equipment shall provide the associated motor.

C. Related Requirements:

1. Section 260573 “Power System Studies”.

1.3 ALLOWANCES

1.4 DEFINITIONS

A. DE: Drive end.

B. ODE: Opposite drive end. See NDE.

C. NDE: Non-drive end. See ODE.

D. NETA ATS: Acceptance Testing Specification.

E. ODG: Open Drip-Proof, Guarded.

F. ODP: Open Drip-Proof.

G. RTD: Resistance Temperature Detector.

H. TEAAC: Totally-Enclosed Air to Air Cooled.

I. TEPV: Totally-Enclosed Force Ventilated.

J. TEWAC: Totally-Enclosed Water to Air Cooled.

K. TEXP: Totally-Enclosed, Explosion-Proof.

L. THD: Total harmonic distortion.

M. VFC: Variable-frequency motor controller. See VFD.

N. VFD: Variable-frequency drive. Used interchangeably with the term VFC.

O. WPI: Weather Protected, Type I (1).

P. WPII: Weather-Protected, Type II (2).

1.5 ACTION SUBMITTALS

A. Product Data: For each type and rating of motor indicated.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Include nameplate data, compliance with specified standards, electrical ratings and characteristics, physical dimensions, frame size, weights, mechanical performance data, support points and the following:

    a. Descriptive bulletins, including full description of insulation system.
    b. Bearing design data.
    c. Efficiency at ½, ¾ and full load.
    d. Power factor at ½, ¾ and full load.
    e. Conduit entry points and sizes.
    f. Special features and accessories (i.e. space heaters, temperature detectors, etc.).

B. Shop Drawings: For each type of rating of motor indicated.

1. Include a tabulation of installed devices with features and ratings.
2. Include dimensioned plans and elevations.
3. Include a plan view and cross section of equipment base showing clearances, manufacturer's recommended work space, and locations of penetrations for grounding and conduits. Show location of anchor bolts and leveling channels.
4. Include details of equipment assembly. Indicate dimensions, weights, loads, required clearances, method of field assembly, and location and size of each field connection.
5. Include copy of nameplate.
6. Wiring Diagrams: Power and low-voltage.

C. Copy of this specification, confirming compliance with each paragraph. Clearly note exceptions.

D. System testing plan for functional demonstration upon completed installation.

1.6 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout on which, the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Required working clearances and required area above and around motors and the driven process equipment.
2. Show process equipment layout and relationships between electrical components and adjacent structural and mechanical elements. Include location of light fixtures, sprinkler piping and heads, HVAC ducts and diffusers.
3. Show support locations, type of support, and weight on each support.
4. Indicate field measurements.

B. Qualification Data: For manufacturer.

C. Seismic Qualification Certificates: For each motor, accessories, and components, from manufacturer.

1. Certificate of compliance.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Product Certificates: For each type of motor from manufacturer.

E. Product Test Reports: For each motor unit assembly, for tests performed by manufacturer and witnessed by a qualified testing agency.

F. Source quality-control reports.

G. Field quality-control reports.

H. Sample Warranty: For special warranty.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data for motors and accessories as required in Section 017823 “Operation and Maintenance Data”.

1.8 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Touchup Paint: Three half-pint containers of paint matching enclosure's exterior finish.

1.9 QUALITY ASSURANCE

A. Electric motors driving identical equipment shall be identical.

B. Testing Agency Qualifications: Member company of NETA.

1. On-site lead technician with NETA certification of a level 3 or higher, or equivalent certification.

1.10 DELIVERY, STORAGE AND HANDLING

A. Ship motor fully assembled, capable of being lifted in one piece. Comply with Section 016000, “Product Requirements” for transporting, handling, storing, and protecting products.

B. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

C. Storage:

1. Store materials according to manufacturer instruction.
2. Energize motors furnished with space heaters to prevent condensation throughout the storage and construction period. Perform periodic motor insulation resistance tests per manufacturer’s storage recommendations.
3. For extended outdoor storage, remove motors from equipment and store separately.
4. Maintain bearings during storage and construction period, and periodically rotate the motor shaft per manufacturer’s storage recommendations.
5. Lubricate per manufacturer’s recommendations and inspect purged grease for water, rust, or other contaminants.

D. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Provide additional protection according to manufacturer instructions.

1.11 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of motors that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. WEG.
2. GE
3. Siemens

2.2 GENERAL MOTOR REQUIREMENTS

A. Comply with requirements in this Section except when stricter requirements are specified in equipment schedules or Sections.

B. Comply with the latest revision of the following as applicable:

1. NEMA MG 1, “Motors and Generators”.

C. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, including conditions imposed by reduced voltage starting methods, and without exceeding nameplate ratings or considering service factor.

D. Horsepower rating: Size for operation within the full load nameplate rating without applying the service factor, throughout the full range of mechanical or hydraulic operating condition.

E. Specific motor application data such as Hp, rpm, enclosure type, accessories, etc., are specified under the detailed process equipment specification.

F. Nameplates: Engrave or emboss on 316 stainless steel fastened to the motor frame with stainless steel screws or drive pins with information per NEMA MG 1.

G. Space heater: Include 120-volt space heater for moisture control on all motors.

H. Service Factor: 1.15 service factor on sine wave power and 1.0 service factor on VFD power in a 40 degrees C ambient, unless otherwise noted.

I. Motors and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

J. Product Selection for Restricted Space: Drawings indicate maximum dimensions for process equipment and associated motors, including clearances between equipment and adjacent surfaces and other items. Comply with indicated maximum dimensions.

K. Torsional critical speed: First or second torsional critical speed shall be outside the operating speed range for all VFC controlled motors.

L. Starting intervals: Per NEMA MG 1.

M. Cooling provisions: Maintain temperature rises at design levels while operating at the lowest constant torque operating condition and throughout the speed range. Provide auxiliary cooling fans if required.

N. Motors connected to VFCs: Comply with NEMA MG 1, Part 31.

O. Motor Requirements:

1. Motor Type: Induction.
2. Physical Orientation: Vertical.
3. Operating System Voltage and Configuration: 4160 V, three-phase, 60 Hz, delta.
4. Maximum Horsepower: 700 HP.

5. Synchronous Speed: 509 RPM.
6. Service Factor: 1.15.
7. Guaranteed Efficiency: 92.4 percent at 60 Hz, full load.
8. Minimum Power Factor: 72.7 percent at full load.
9. Duty: Continuous
10. Ambient Temperature Rating: 40 degrees C.
11. Altitude Rating: Not exceeding 3300 feet (1000 m).
12. Enclosure: WP1**.**
13. Starting Method: Reduced voltage - Autotransformer.
14. Space heaters for condensation control.
15. Accessories: Per process equipment Section.

2.3 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Motors shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the motor will remain in place without separation of any parts when subjected to the seismic forces specified and the motor will be fully operational after the seismic event."
2. Component Importance Factor is 1.0.
3. Component Amplification Factor: 2.5.
4. Component Response Modification Factor: 6.0.

2.4 INDUCTION MOTORS

A. Enclosure and Frame:

1. NEMA enclosure type as specified in the process equipment specification.
2. NEMA frame for the associated horsepower.
3. Motor frames: Cast iron or welded heavy plate steel box frame construction, stiff enough to withstand the rotating forces and torques generated and designed to limit or avoid harmonic resonances.
4. Provide lifting lugs or provisions on motor frame.
5. Hoods, baffles, and ducts: Corrosion-protected steel.
6. Access covers: Aluminum, cast iron or sheet metal and easily removable for maintenance.
7. Condensate drain openings: Locate drain openings and breathers for removal of accumulated moisture.
8. Hardware: Corrosion resistant machined bolts, screws, and other hardware shall be standard UNF/C thread, hex head type and shall be stainless steel. Metric hardware is not allowed.
9. Nameplates: Engraved or embossed stainless steel plates fastened to the motor frame with stainless steel screws or drive pins. Clearly indicate all items of information listed in the applicable part of NEMA MG 1.
10. Main terminal box: Fabricated steel with bolted and gasketed cover with handles, oversized for stress cone terminations and specified accessories such as lightning arresters, surge capacitors, and differential current transformers. Include provisions for equipment grounding conductor termination. Mount box as shown on process drawings.

11. Bearing housings: provide machined surfaces for attaching a magnet mounted accelerometer to monitor the motor vibration in the vertical, horizontal, and axial directions at each bearing housing.
12. Frame grounding: provide motor frame grounding pad or threaded stud where supplemental grounding to frame is indicated on the drawings.
13. Corrosion resistant mill and chemical duty paint.
14. Air filters for WPI and WPII enclosures: Reusable, washable type inlet air filters with corrosion resistant stainless steel screens. Provide air differential pressure switch for the detection of clogged air filters.

B. Windings:

1. Copper.
2. Vacuum pressure impregnated (VPI) epoxy insulation for moisture resistance.
3. Insulation rating: Class H.
4. Temperature rise: Class B at 1.0 SF, Class F at 1.15 SF.

C. Motor Leads:

1. Same insulation class as windings.
2. Sized for motor nameplate amperes at 1.0 SF.
3. Permanent identification marking, corresponding to nameplate identification.

D. Stator:

1. Built-up core using high grade, low loss silicon steel laminations keyed or dovetailed to the stator frame and securely held in place at each end.
2. Class F or better glass reinforced polyester for coil slot wedge material.

E. Rotor:

1. Forged or rolled steel shaft, machined, smooth finish, with sufficient strength for operation including 25 percent overspeed condition.
2. Shaft end coordinated with driven equipment coupling.
3. Rectangular copper or copper alloy rotor bars, tightly fitted in the slots and permanently locked in slot, brazed to resistance rings at each end of rotor.
4. Rotor end rings to be free of circumferential joints.
5. Entire assembly coated with protective coating.

F. Vertical Bearings: per manufacturer, thrust type.

1. Bearings: Manufacturer's standard design, constructed with thrust bearings on top to allow inspection and/or replacement without requiring complete disassembly of motor, of type and size to satisfy thrust loading requirements.
2. Life: Rated for an in-service L 10 life of 100,000 hours, designed to support the weight of the rotor plus, if required, the weight of the rotating driven equipment parts and the hydraulic thrust created by the driven equipment, with a 40 degrees C maximum temperature rise. Metric bearings are not acceptable.
3. Shaft seals: Provide to prevent grease leakage and the entrance of foreign materials, such as water and dirt, into the bearing area while running, coasting, or at rest.
4. Shaft currents: Provide mitigation per process equipment specification.

5. Comply with ABMA and refer to process equipment specification for stricter or additional requirements.

2.5 STANDARD ACCESSORIES FOR ALL MEDIUM VOLTAGE MOTORS

A. Space heaters: Silicone rubber strip type, accessible for inspection, rated 120 Volt, single phase, designed to prevent condensation inside the enclosure when the motor is idle, with leads brought out to a separate terminal box. Emboss the heater wattage and voltage on the motor nameplate.

B. Shaft grounding ring/device for motors connected to variable frequency controllers.

C. Stator temperature sensors: Six 100 Ohm platinum (PT 100), three-wire resistance-type temperature detectors (RTDs) embedded in the stator windings, two per phase, symmetrically installed between stator coils where highest temperature will occur. RTD leads brought out to separate terminal box on the motor frame. One RTD set in each phase to be operational and one RTD set to be spare.

D. Accessory terminal boxes: Separate cast iron motor mounted terminal boxes for RTDs, space heaters, and other specified accessories, arranged to rotate in 90 degree increments to accommodate conduit entry from any quadrant.

E. Grounding: Minimum of two copper faced pads on motor frame, grounding terminal mounted in the main terminal box.

2.6 ADDITIONAL ACCESSORIES

A. Bearing temperature sensing: Number, type, and location for motor and driven equipment per process equipment specification.

1. RTD: Replaceable 100 Ohm platinum (PT 100) three-wire RTD's, with spring loaded tip. Mount RTD as close as possible to outer surface of each bearing. RTD includes conduit connection head, terminal block, and cabling brought out to a common terminal box.
2. Dial type thermometer.
3. Temperature relay, furnished with indicating scale.
4. Iron or copper constantan thermocouple.

B. Bearing vibration sensors: Number, type, and location for motor and driven equipment per process equipment specification. Sensor cabling brought out to a common terminal box.

1. Proximity type.
2. Accelerometer.

C. Differential motor protection: Provide three window-type current transformers (one per phase), mounted in the main terminal box to provide self-balancing differential protection. Pass each phase motor lead through individual current transformers. Transformer ratios per contract drawings.

D. Surge protection:

1. Surge Arresters: Comply with IEEE C62.11, Distribution Class; metal-oxide-varistor type, with ratings as indicated, one per phase, mounted in the main terminal box.
2. Surge Capacitors: Non-PCB type, used in conjunction with a surge arrester and mounted in the main terminal box.

E. Anti-backspin device: Provide shaft mounted, mechanical non-reverse ratchet rated at 100 percent of motor full load torque for immediate protection against reversing due to phase reversals or from backspin at shutdown.

F. Acoustical attenuation: As required to meet the specified sound pressure level.

2.7 POWER FACTOR CORRECTION CAPACITORS

A. Select the Power Factor Correction Capacitor (PFCC) rating to provide an operating power factor of the motor between 93 to 95 percent at full load and 95 to 98 percent when partially loaded. The capacitor current shall not exceed the motor no-load magnetizing current.

B. Provide the required capacitor and capacitor information to the medium voltage motor controller manufacturer for inclusion inside the controller package.

C. Capacitors: UL listed, NEMA rated and tested, three phase dry film or non-PCB dielectric liquid insulated, with three current limiting fuses rated for 100kA interrupting capacity at 5kV, equipped with internal discharge resistors and fuse loss indicators, mounted in hermetically sealed steel enclosure suitable for conduit connection. Covers shall be gasketed, bolt-on type.

2.8 IDENTIFICATION

A. Nameplates

1. White background / black lettering, 1-inch high lettering.
2. Identify all motor termination boxes with voltage rating.
3. Identify all motor accessory boxes with accessory designation.

2.9 SOURCE QUALITY CONTROL

A. Induction Motor Factory Testing: Prior to shipment perform manufacturer’s standard tests in accordance with NEMA MG 1 and IEEE 112.

B. Include all travel costs for two personnel (one Owner and one Engineer representative) to witness the factory tests. Travel costs include but are not limited to sufficient days/nights necessary for transportation, lodging, meals, and expenses to complete successful testing of all motors. Notification and scheduling of tests: minimum three weeks prior to test.

C. Prepare test and inspection reports.

PART 3 - EXECUTION

© 2026 CDM Smith
All Rights Reserved

3.1 EXAMINATION

A. Upon delivery of motor and prior to unloading, inspect equipment for damage.

B. Comply with DELIVERY, STORAGE, AND HANDLING article within this specification.

3.2 INSTALLATION

A. Prepare rigid foundation or mounting surface to minimize vibration and maintain alignment between motor and load shaft.

B. Install the motors per manufacturer's installation instructions.

C. Anchor motor base to load bearing surface with grade 5 steel bolts or better.

D. Align the motor shaft with driven equipment according to manufacturer’s written instructions. Adjust axial position of motor frame with respect to load shaft.

E. Accurately adjust flexible couplings for direct drive according to machine manufacturer’s guidelines. Check alignment to minimize vibrations. Coupling spacing shall be according to coupling manufacturer guidelines.

F. Install motor branch circuit conduits and conductors in accordance with NEC and local code requirements.

G. Terminate the motor leads as shown on the connection diagrams.

H. Ground equipment according to Section 26056, “Grounding and Bonding for Electrical Systems”.

I. Tighten electrical connections and terminals according to manufacturers' published torque values.

J. Install conduit and wiring between motor auxiliary devices and associated indicators, controllers and protective devices in accordance to installation drawings.

K. Connect devices sensitive to electromagnetic interferes such as RTD's, thermistors, thermal protector switches, vibration sensors with shielded instrumentation wiring per installation drawings.

L. Comply with NECA 1.

M. Seismic Bracing: Comply with requirements specified in Section 260548.16 "Seismic Controls for Electrical Systems."

3.3 IDENTIFICATION

A. Comply with requirements for identification specified in Section 260553, "Identification for Electrical Systems."

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
2. Label each motor terminal box with engraved nameplate.

3.4 PROTECTION

A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until motors are ready to be energized and placed into service.

B. Lubrication and Shaft Rotation: Lubricate parts and rotate shaft periodically according to manufacturer’s written instructions until motors are ready to be energized and placed into service.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections with the assistance of a factory-authorized service representative.

D. Perform inspections and tests for induction motors according to the Inspection and Test Procedures for Rotating Machinery stated in NETA Acceptance Testing Specification paragraph 7.15.1. The following optional tests are required: alignment checks: air-gap spacing, manual rotation of rotor and shaft, shaft extension runout measurement; insulation power-factor or dissipation factor; vibration.

E. Perform inspections and tests of other applicable motor major components (instrument transformers, surge arresters, etc.) in accordance with NETA ATS for that component. Optional tests listed in NETA ATS are required.

F. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

G. Perform the following infrared (thermographic) scan tests and inspections, and prepare reports:

1. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each motor exterior for detection of hot spots in stator or bearings.
2. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each motor 11 months after date of Substantial Completion.
3. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

H. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

I. Motors will be considered defective if they do not pass tests and inspections.

J. Prepare test and inspection reports, including a certified report that identifies the motor and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.6 STARTUP AND ADJUSTMENT

A. Engage a factory-authorized service representative to perform startup service.

B. Complete installation and startup checks according to manufacturer's written instructions. Confirm motor is structurally, mechanically, and electrically ready for start-up. Checks include support system, vibration isolation, alignment, lubrication system, and cleanliness.

C. Verify correct phase rotation at motor with driven equipment uncoupled. Correction for phase rotation to be made in the motor terminal box.

D. Prepare inspection and test reports. Include adjustment settings made.

3.7 DEMONSTRATION / SYSTEM FUNCTION TESTS

A. Run motor for system testing as required in motor controller and driven equipment specifications.

B. Confirm correct operation of all protective and metering devices. Confirm correct polarity on current transformers.

C. Measure voltage and motor running current and evaluate relative to load conditions and nameplate full load amperes. Corrective action is required for any current imbalance 10 percent or greater.

D. Prepare driven equipment system testing report. Include results of all tests and check made, meter readings and recordings, and summary adjustments made. Clearly identify any discrepancies and concerns.

SECTION 404213 - PROCESS PIPING INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Process piping insulation.
2. Jacketing.
3. Accessories.

B. Related Requirements:

1. Section 078400 “Firestopping” for product requirements for firestopping and placement by this Section.
2. 099679 “Atmospheric Protection and Plant Service Areas Coatings” for execution requirements for painting insulation jackets and coverings as specified by this Section.

1.3 PREINSTALLATION MEETINGS

A. See Section 013100 “Project Management and Coordination” for preinstallation meeting requirements.

B. Convene minimum one week prior to commencing Work of this Section.

1.4 ACTION SUBMITTALS

A. See Section 013300 “Submittal Procedures” for submittals requirements.

B. Product Data: Product description, thermal characteristics, list of materials, and thickness for each service and location.

C. Samples: Submit two samples of representative size, illustrating each insulation type.

1.5 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificate: Products meet or exceed specified requirements.

B. Manufacturer's Instructions: Manufacturer's published literature indicating recommended installation procedures.

C. Qualifications Statements:

1. Qualifications for manufacturer and applicator.
2. Manufacturer's approval of applicator.

1.6 QUALITY ASSURANCE

A. Test pipe insulation for maximum flame-spread index of 25 and maximum smoke-developed index not exceeding 50, according to ASTM E84.

B. Comply with ASTM C585 for inner and outer diameters of pipe insulation.

C. Factory-fabricated fitting covers according to ASTM C450.

D. Perform Work according to standards set by authorities having jurisdiction.

E. Maintain a copy of each standard affecting Work of this Section on Site.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' documented experience.

B. Applicator: Company specializing in performing Work of this Section with minimum three years' documented experience and approved by manufacturer.

1.8 DELIVERY, STORAGE, AND HANDLING

A. See Section 016000 “Product Requirements” for transporting, handling, storing, and protecting products requirements.

B. Accept materials on-Site in original factory packaging, labeled with manufacturer's identification, including product density and thickness.

C. Inspection: Accept insulation on-Site in manufacturer's packaging. Inspect for damage.

D. Store insulation according to manufacturer's instructions.

E. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Provide additional protection according to manufacturer instructions.

1.9 AMBIENT CONDITIONS

A. See Section 015000 “Temporary Facilities and Controls” for ambient condition control facilities for product storage and installation requirements.

B. Install insulation only when ambient temperature and humidity conditions are within ranges as recommended by manufacturer.

C. Maintain recommended temperature and humidity before, during, and after installation for minimum of 24 hours, or longer if required by the product manufacturer’s instructions.

1.10 EXISTING CONDITIONS

A. Field Measurements:

1. Verify field measurements prior to fabrication.
2. Indicate field measurements on Shop Drawings.

1.11 WARRANTY

A. See Section 017700 “Closeout Procedures” for warranties requirements.

B. Furnish five-year manufacturer's warranty for human-made fiber.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Glass Fiber and Mineral Fiber Insulation:

B. Manufacturers:

1. CertainTeed LLC; Saint-Gobain North America.
2. Johns Manville; a Berkshire Hathaway company.
3. Knauf Insulation.

C. Closed-Cell Elastomeric Insulation:

D. Manufacturers:

1. Aeroflex USA.
2. Armacell LLC.
3. K-Flex USA.

2.2 PIPE INSULATION

A. Type P-2: Molded glass fiber.

1. Comply with ASTM C547. Comply with ASTM C795 for application on austenitic stainless steel.
2. Thermal Conductivity: 0.24 Btu-in./h-sq. ft.-deg. F at 75 degrees F.
3. Operating Temperature Range: Zero to 850 degrees F.

B. Type P-5: Flexible, closed-cell elastomeric and tubular.

1. Comply with ASTM C534, Type I.
2. Thermal Conductivity: 0.27 Btu-in./h.-ft.-deg. F at 75 degrees F.
3. Operating Temperature Range: Minus 70 to 180 degrees F.

2.3 PIPE INSULATION JACKETS

A. Vapor-Retarder Jacket: White kraft paper with glass-fiber yarn, bonded to aluminized film.

1. Comply with ASTM C921.
2. Water Vapor Permeance: 0.02 perms complying with ASTM E96.

B. PVC Plastic Pipe Jacket: One-piece, molded-type fitting covers and sheet material.

1. Color: Off-white.
2. Comply with ASTM D1785.
3. Thickness: 15 mils.
4. Connections: As recommended by the insulation manufacturer.

C. Aluminum Pipe Jacket:

1. Comply with ASTM B209.
2. Sheet Thickness: 0.016 inches .
3. Finish: Embossed.
4. Joining: Longitudinal slip joints with 2-inch laps.
5. Fitting Covers: Description: Die-shaped, with factory-attached protective liner.

    a. Thickness: 0.016 inches .

6. Metal Jacket Bands:

    a. Width: 1/2 inches .
    b. Thickness and Material: 0.015 inches aluminum.

2.4 PIPE INSULATION ACCESSORIES

A. Vapor-Retarder Lap Adhesive: Compatible with insulation.

B. Covering Adhesive Mastic: Compatible with insulation.

C. Piping 1-1/2-Inch Diameter and Smaller:

1. Galvanized-steel insulation protection shield.
2. Comply with MSS SP-69, Type 40.
3. Length: Based on pipe size and insulation thickness.

D. Piping 2-Inch Diameter and Larger:

1. Wood insulation saddle, hard maple.
2. Inserts Length: Not less than 6 inches.
3. Thickness and Contour: Match adjoining insulation.

E. Closed-Cell Elastomeric Insulation Pipe Hangers:

1. Polyurethane insert with aluminum single-piece construction and self-adhesive closure.
2. Thickness: Match pipe insulation.

F. Insulating Cement:

1. Comply with ASTM C195.
2. Hydraulic setting on mineral wool.

G. Adhesives: Compatible with insulation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. See Section 017300 “Execution” for examination and installation requirements.

B. Verify that piping and equipment has been tested before applying insulation materials.

C. Verify that surfaces are clean and dry, with foreign material removed.

3.2 INSTALLATION - PIPING SYSTEMS

A. Piping Exposed to View in Finished Spaces: Locate insulation and cover seams in least visible locations.

B. Fire-Rated Penetrations:

1. Continue insulation through penetrations of building assemblies or portions of assemblies having fire-resistance rating of one hour or less.
2. Provide intumescent firestopping when continuing insulation through assembly.
3. Finish at supports, protrusions, and interruptions.

C. Piping Systems Conveying Fluids Below Ambient Temperature:

1. Insulate entire system, including fittings, valves, unions, flanges, strainers, flexible connections, and expansion joints.
2. Jacketing:

a. Furnish factory-applied or field-applied vapor-retarder jackets.
b. Secure factory-applied jackets with pressure-sensitive adhesive with self-sealing longitudinal laps and butt strips.
c. Secure field-applied jackets with outward-clinch expanding staples, and seal stapled penetrations with vapor-retarder mastic.

3. Fittings, Joints, and Valves:

a. Insulate with molded insulation of like material and thickness as adjacent pipe.
b. Finish with glass cloth and vapor-retarder adhesive or PVC fitting covers.

D. Inserts and Shields:

1. Piping 1-1/2 inch Diameter and Smaller: Install galvanized- steel shield between pipe hanger and insulation.
2. Piping 2 inch Diameter and Larger:

   a. Install insert between support shield and piping, and under finish jacket.
   b. Insert Configuration: Minimum long, of thickness and contour matching adjoining insulation; may be factory fabricated.
   c. Insert Material: Compression-resistant insulating material suitable for planned temperature range and service.

3. Piping Supported by Roller-Type Pipe Hangers: Install galvanized- steel shield between roller and inserts.

E. Closed-Cell Elastomeric Insulation:

1. Push insulation onto piping.
2. Miter joints at elbows.
3. Seal seams and butt joints with manufacturer's recommended adhesive.
4. If application requires multiple layers, apply with staggered joints.
5. Insulate fittings and valves with insulation of like material and thickness as adjacent pipe.

F. Prepare pipe insulation for finish painting as specified in “099679 “ Atmospheric Protection and Plant Service Areas Coatings”.

3.3 ATTACHMENTS

A. Process Piping Insulation Schedule:

1. Protected Water:

   a. Type P-2 or P-5.
   b. Thickness: 2 inches

END OF SECTION 404213

SECTION 406100 - PROCESS CONTROL AND ENTERPRISE MANAGEMENT SYSTEMS GENERAL PROVISIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes procurement of the services of a Process Control System Supplier (PCSS) to provide all materials, equipment, labor, and services required to achieve a fully integrated and operational system as specified herein, in “Related Requirements” under this Article, and in related drawings, except for those services and materials specifically noted.

B. Under this contract, the PCSS will also serve as the Applications Engineer System Supplier (AESS).

C. Include auxiliary and accessory devices necessary for system operation or performance, such as transducers, relays, signal amplifiers, intrinsic safety barriers, signal isolators, software, and drivers to interface with existing equipment or equipment provided by others under other Sections of these specifications, whether indicated on the Drawings or not.

D. All equipment and installations to satisfy applicable Federal, State and local codes. Refer to Electrical drawings for area classifications for Class and /Division ratings.

E. Use the equipment, instrument, and loop numbering scheme indicated on the Drawings and in the specifications in the development of the submittals. Do not deviate from or modify the numbering scheme.

F. Related Requirements: The XX in the numbers below indicates all spec sections starting with the first 4 numbers (indicating a category described in the accompanying text) are included in the reference, e.g. Section 4062XX “Sections for Computer System Hardware”:

1. Section 4062XX “Sections for Computer System Hardware.”
2. Section 4063XX “Sections for Control System Equipment.”
3. Section 4066XX “Sections for Network and Communication Equipment.”
4. Section 4067XX “Sections for Control System Equipment Panels and Racks.”
5. Section 4068XX “Sections for Process Control Software.”
6. Section 406863 “Configuration of HMI Software.”
7. Section 406866 “Configuration of Controller Software.”
8. Section 407000 “Instrumentation for Process Systems.”
9. Section 4071XX “Sections for flow measurement.”
10. Section 4072XX “Sections for level measurement.”
11. Section 4073XX “Sections for pressure, strain, and force measurement.”

12. Section 4077XX “Sections for position and motion measurement.”

G. HMI screen display configuration to match the characteristics (font style, size, color, symbols, etc.) of the existing plant-wide system and be developed in accordance with the current Nassau County SCADA standards. Coordinate with Client’s Operator and tie required signals into the existing HAHC WIMS system.

1.3 DEFINITIONS

A. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

B. Applications Engineering System Supplier (AESS): The entity who provides all programming, configuration, and related services for the control system equipment provided by the PCSS.

C. Maintenance of Plant Operations (MOPO): A construction plan which prevents or limits process disruptions during construction.

1.4 PREINSTALLATION MEETINGS

A. Conduct a project kickoff coordination meeting within two weeks after submitting the Project Plan. The purpose of the meeting is to discuss the PCSS's Project Plan, to summarize the PCSS's understanding of the project; discuss any proposed substitutions or alternatives; schedule testing and delivery deadline dates; provide a forum to coordinate hardware and software related issues; and request any additional information required from the Owner. The meeting will last up to 4 hours.

B. Conduct a submittal review coordination meeting after the Hardware, Panel Drawing, and Loop Drawing Submittal package has been reviewed by the Engineer and returned to the PCSS.

1. Proposed agenda items should include, but are not limited to:

a. Review comments made on the submittal package
b. Refine scheduled deadline dates
c. Coordinate equipment installation activities
d. Provide a forum for any further required coordination between the PCSS and AESS.

2. The meeting will last up to 4 hours.

C. Conduct a testing coordination meeting at least two weeks prior to factory testing occurring.

1. Proposed agenda items should include, but are not limited to:

a. Discuss the specifics of the proposed tests
b. Provide a forum for coordination between hardware, software, and cybersecurity testing being performed.

D. Attendance at General Contractor’s MOPO workshop.

E. The plant's existing SCADA system must continue to operate during transition between existing plant facilities and new facilities provided under this contract.

1. Coordinate with the plant and contractor to ensure that work on existing SCADA system allows Operations to view and control existing equipment for the duration of this project.

F. The PCSS will conduct a meeting to discuss the control philosophy for restarting and sequencing the plant equipment following a power outage.

1. Required Attendees:

a. General Contractor,
b. Major equipment vendors impacted by the restart,
c. Generator Vendor

2. General guidance is included in 406196 "Process Control Descriptions," which must be updated to reflect specifics of equipment installed for this project.

G. Monthly on-site or conference call coordination meetings with Engineer, Contractor, and Vendors, as required prior to any field start-up or activity testing begins.

H. Schedule the mandatory coordination meetings as described herein. Hold the meetings at the Owner's designated location and include attendance by the Owner, the Engineer, the Contractor, the PCSS's Project Engineer, and the AESS Project Engineer, if applicable. Other Division 40 specifications may require additional meetings. Prepare and distribute an agenda for this meeting a minimum of one week before the scheduled meeting date. Schedule the meeting for a minimum of one week before the requested meeting date.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings:

1. Include plans, elevations, sections, mountings, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Detail fabrication and assembly of control equipment, control panels, and instrumentation as specified herein.
4. Include diagrams for power, signal, and control wiring.

C. Qualifications Submittal:

1. For non-listed PCSS', submit, within 30 calendar days after Notice to Proceed, detailed information on staff and organization to indicate compliance with the Quality Assurance requirements of this Section. The Qualifications submittal is required to be submitted and approved before any further submittals will be accepted. Failure to meet the minimum requirements is grounds for rejection as a PCSS. The Qualifications Submittal to contain the following:

    a. Copies of ISA CCST Level 1 certificates for all field technicians or resumes demonstrating field experience.
    b. Notarized statement from the firm's financial institution demonstrating ability for the firm to meet the obligations necessary for the performance of the work.
    c. Copy of UL-508 certificate for panel fabrication facilities.
    d. Project references for water or wastewater projects as defined in the "Quality Assurance" paragraphs.
    e. Documentation to demonstrate the ability to complete this project including resumes of key staff, financial capacities, details on engineering, design, fabrication, and field service capacity, and location of staff responsible for responding to the site within four hours to resolve startup issues.

D. Project Plan, Deviation List, and Schedule Submittal:

1. Submit, within 45 calendar days after Notice to Proceed, a Project plan. Submit for approval the Project Plan before further submittals are accepted. The Project Plan to contain the following:

    a. Overview of the proposed control system describing the understanding of the project work, a preliminary system architecture drawing, interfaces to other systems, schedule, startup, and coordination. Include a general discussion of startup, replacement of existing equipment with new, switchover (Maintaining Plant Operations during system transition), approach to testing and training, and other tasks as required by these specifications.
    b. Preliminary list of HMI software, PLC software, and PLC hardware, including version numbers, solely to determine compliance with the requirements of the Contract Documents prior to beginning development of system programming. The review and approval of software and hardware systems as part of this Project Plan stage does not relieve the PCSS of meeting all the functional and performance requirements of the system as specified herein. Substitution of manufacturer or model of these systems after the submittal is approved is not allowed without Engineer's approval.
    c. Project personnel and organization including the PCSS project manager, project engineer, and lead project technicians. Include resumes of each of these individuals and specify in writing their commitment to this project. These do not need to be submitted again if already submitted in the Qualification submittal.
    d. Sample formats of the shop drawings to be submitted and in conformance with the requirements of the Specifications. At a minimum include samples of panel fabrication drawings, loop drawings, control system architecture and I/O wiring diagrams.

2. Define Exceptions to the Specifications or Drawings in a Deviation List consisting of a paragraph-by-paragraph review of the Specifications indicating acceptance or any proposed deviations, the reason for exception, the exact nature of the exception and the

proposed substitution so that an evaluation may be made by the Engineer. Specifically state if no exceptions are taken to the specifications or drawings. If there is no statement by the PCSS, then it is acknowledged that no exceptions are taken.

3. The PCSS must coordinate their work with the General Contractor's overall schedule. PCSS schedule incorporates all PCSS milestones including but not limited to the following:

    a. Schedule for all subsequent project submittals. Include the time required for Contractor's submittal preparation, Engineer's review time, and a minimum of two complete review cycles.
    b. Proposed dates for all project coordination meetings.
    c. Hardware purchasing, fabrication, and assembly (following approval of related submittals).
    d. Software purchasing and configuration (following approval of related submittals).
    e. Shipment of instrument and control system equipment.
    f. Installation of instrument and control system equipment.
    g. Testing: Schedule for all testing.
    h. Schedule for system cutover, startup, and/or going on-line for each major system. At a minimum include the schedule for each process controller and HMI server/workstation provided under this Contract.
    i. Schedule for all training including submittal and approval of O&M manuals, factory training, and site training.
    j. Listing of all major graphics and PLC programs intended to be created or modified for this project. Indicate if graphic or program is new or existing.

4. Component and Wiring Identification and Tagging Plan:

    a. All components provided by PCSS require a tag, label, or nameplate. Review specifications and provide a plan indicating the tagging and labeling scheme used by the PCSS for the following:

        1) Instruments.
        2) Panel Hardware.
        3) Standalone hardware or communication equipment.
        4) Wires and communication cables.

    b. Provide detailed information so Engineer can review the following characteristics for each type of tag, label, or nameplate for the different types of components provided above:

        1) Size or range of size of the tag, label or nameplate.
        2) Font style.
        3) Material.
        4) Color(s).

E. Input/Output (I/O) List Submittal:

1. Submit, within 60 days after Notice to Proceed, a complete system Input/Output (I/O) address list for equipment connected to the control system under this Contract.
2. Base the I/O list on the P&ID's, the Drawings, the design I/O list (if included), and requirements in the Specifications.

3. Submit the I/O list in both a Microsoft Excel readable electronic file format and an 8-1/2 inch by 11-inch hard copy.
4. Reflect all active and spare I/O points on the I/O list. Add points to accommodate spare I/O's as required in the specifications.
5. Arrange the I/O list so that each control panel has a dedicated worksheet, which includes the following information:

    a. TAG NUMBER(S): As indicated on the Drawings, the identifier assigned to a device that performs a function in the control system. As part of this information, break out the tag loop number to allow for sorting by loop.
    b. DESCRIPTION: A description of the function of the device (text that includes signal source, control function, etc.) Include the text "Spare Points" for all I/O module points that are not connected to equipment.
    c. PHYSICAL LOCATION: The Control Panel designation of where the I/O point is wired to.
    d. PHYSICAL POINT ADDRESS: Rack, Slot, and Point (or Channel) assignment for each I/O point.
    e. I/O TYPE: use DO - Discrete Output, DI - Discrete Input, AO - Analog Output, AI - Analog Input, PI - Pulse Input, or PO - Pulse Output.
    f. RANGE/STATE: The range in engineering units corresponding to an analog 4-20 mA signal, or, the state at which the value of the discrete points is "1."
    g. ENGINEERING UNITS: The engineering units associated with the Analog I/O.
    h. ALARM LIMITS: Include alarm limits based on the control descriptions and the Drawings.
    i. P&ID - the P&ID or drawing where the I/O point appears on. Mark as "NA" (Not Applicable) if the I/O point is derived from a specification requirement and is not on the P&IDs.
    j. LOGICAL POINT ADDRESS: I/O address of each point.
    k. EXISTING or NEW I/O POINT: Indicate if point is existing (E) or new (N).
    l. CONDITION OF EXISTING SIGNAL: Condition of existing I/O signals to be noted as functional (F) if working properly or if not functioning (NF) with issue described.

6. Sort the I/O list in order by:

    a. Physical location.
    b. I/O Type.
    c. Loop Number.
    d. Device Tag.

7. Once the I/O list is approved, the PLC I/O addresses are not to be modified without approval by the Engineer.
8. Where multiple sets of mechanical equipment are provided for process redundancy, arrange their field connections to I/O modules so that the failure of a single I/O module will not disable the redundant system.

    a. This applies to all I/O types.
    b. The acceptability of the I/O arrangement is at the discretion of the Engineer.

9. For I/O layout requirements, refer to Section 406343 "Programmable Logic Controllers."

F. Field Instruments Submittal:

1. Refer to section 407000 “Instrumentation for Process Systems” for submittal requirements.

G. Control System Architecture**,** Hardware and Software Packages Submittal:

1. Refer to the sections below for equipment required as part of the Hardware and Software Packages submittal:

   a. Section 4062XX “Sections for Computer System Hardware.”
   b. Section 406343 “Programmable Logic Controllers”
   c. Section 406343 “PLC Hardware and Software.”
   d. Section 4068XX “Sections for Process Control Software.”
   e. Section 4066XX “Sections for Network and Communications Equipment.”
   f. Section 4067XX “Sections for Control System Equipment Panels and Racks.”

2. For each hardware and software packages component specified in the sections above, submit a cover page that lists date, specification number, product name, manufacturer, model number, location(s), and power required. Preferred format for the cover page is ISA-TR20.00.01-2001 (updated in 2004-2006), general data sheet; however, other formats will be acceptable provided they contain all required information.
3. Complete system architecture drawing(s) showing in schematic form the interconnections between major hardware components including, control panels, computers, networking equipment, control panels with PLC systems and I/O modules, local operator interfaces, process equipment vendor panels with PLCs, and networked peripherals such as power monitors, security cameras, etc. The PCSS is required to provide unique network architecture drawings for the following networks:

   a. SCADA
   b. Security
   c. HVAC
   d. Electrical/Power Monitoring.
   e. Cybersecurity Monitoring.

4. Develop the system architecture drawing(s) in accordance with the following information and guidelines:

   a. Show power connections to each piece of equipment or grouping of equipment with voltage and power sources noted such as 120VAC UPS battery, 24VDC battery, or 120VAC from LP (lighting panel). Indicate specific UPS number or circuit number whenever possible.
   b. All communication cable types should be uniquely identified with a specific linetype, and cable characteristics clearly indicated in a key or legend located on drawing(s). For example, 50/125-micron multimode mode fiber, or CAT6 Ethernet copper cabling. Any multiconductor communication cables will be clearly labeled above each individual communication with a note added to drawing that states if no quantity exists above a linetype, there is only one communication cable between devices. If a multi-conductor cable has multiple colors, legend to clearly indicate which colors are used for which networks (i.e., a multi-pair fiber optic

cable used for dedicated networks such as SCADA, Electrical, Security, HVAC, etc.)

c. All communication cables need to be assigned a unique cable identification label and shown in either a table or above the communication line.
d. Identify network protocols for each communication path or for system indicated in a key or legend as appropriate. Examples are Allen-Bradley EtherNet/IP, Modbus TCP/IP, or DNP3.
e. Indicate which port or connection number the communication cable is terminating at any device that has multiple ports or connection points. For multiple devices, this could be shown once in a key or legend and noted on architecture as appropriate.
f. For each PLC control panel or network communication enclosure provided by PCSS, the architecture drawing clearly references other drawings provided by the PCSS for detailed panel wiring diagrams with a note near that PLC panel or communication enclosure indicating referenced drawing numbers. A placeholder is acceptable at the time of submission if these drawings are to be submitted at a later date.
g. Use symbology and/or icons whenever possible to represent a device and differentiate between devices that are different form factors (i.e. tower computer vs. desktop computer vs. rack mounted). Vendor CAD libraries are preferred for symbols.
h. Develop a diagram that will allow a qualified technician to interconnect all equipment without having to refer to additional manuals or literature.
i. Use a minimum sheet size of 11"x17" and use of more than one sheet is acceptable with a logical breakout between sheets (i.e., head end on one sheet and plant control system on another). Clearly identify line continuations between drawings.

5. Coordinate with the information provided in these submittals with information provided in Cybersecurity related submittals provided as part of Section 408100 “Industrial Control System Cybersecurity.”
6. Provide a software schedule or spreadsheet which clearly indicates which software packages and operating systems are loaded onto which computers and servers.

H. Panel Layout Drawings and Wiring Diagrams Submittal:

1. Panel Layout Drawings: Submit Drawings for all panels specified. Draw to scale panel assembly and elevation drawings, detailing all equipment in or on the panel. Use 11-inch by 17-inch sheet size for panel drawings and include the following:

a. Clearly indicate a legend sheet with all symbols used on drawings and with voltage, color and size of each wire and in accordance with requirements of Section 406733 “Panel Wiring.”
b. Interior and exterior panel elevation drawings to scale.
c. Nameplate schedule.
d. Conduit access locations.
e. Panel construction details.
f. Cabinet assembly and layout drawings to scale. Include a bill of material on the assembly drawing with each panel component clearly defined. Cross-reference the bill of material to the assembly drawing so that a non-technical person can readily identify all components of the assembly by manufacturer and model number.
g. Fabrication and painting specifications including color (or color samples).

h. Construction details, NEMA ratings, intrinsically safe barrier information, gas sealing recommendations, purging system details, etc. for panels located in hazardous locations or interfacing to equipment located in hazardous areas.

1) Where intrinsically safe systems are utilized to satisfy requirements for hazardous locations, comply with the NEC (NFPA 70 Art. 504). Provide intrinsically safe control drawings as required by NFPA 70 Art. 504.10. Intrinsically safe control drawings that follow the recommendations of ISA RP12.2.02-1996 are also acceptable.

a) Indicate the method for intrinsically safe wiring methods as required by Section 406717 “Industrial Enclosures.” Specifically note the methods of separation, clearances, and grounding and bonding utilized.

i. Submit evidence that all control panels are constructed in conformance with UL 508 and bear the UL seal confirming the construction. Specify if UL compliance and seal application accomplished at the fabrication location or by field inspection by UL inspectors. Costs associated with obtaining the UL seal and any inspections are be borne by Contractor.

2. Wiring Diagrams Submittal:

a. PCSS to provide complete wiring diagrams showing all wiring connections in the I/O system where direct hardwired interfaces exist between the PCSS control panels and vendor provided control panels furnished under other Divisions. This includes but is not limited to terminal block numbering, relay contact information, instruments, equipment, and control panel names. Include drawings in Final O&M submittal. Leaving this information blank on Final Documentation drawings is not acceptable.

b. Panel wiring diagrams depicting wiring within and on the panel as well as connections to external devices. If ISA Loop Wiring Diagrams are specified below, equipment external to the control panel and related external connections do not need to be shown on the Panel Wiring Diagrams. Panel wiring diagrams include power and signal connections, UPS and normal power sources, all panel ancillary equipment, protective devices, wiring and wire numbers, and terminal blocks and numbering. Field device wiring includes the device ISA-tag and a unique numeric identifier. Diagrams identify all device terminal points that the system connects to, including terminal points where I/O wiring lands on equipment not supplied by the PCSS. Wiring labeling used on the drawings match that shown on the Contract Documents or as developed by the PCSS and approved by the Engineer. I/O wiring numbered with rack number, slot number, and point number. Two-wire and four-wire equipment to be clearly identified, and power sources noted. Submit final wire numbering scheme. Provide panel drawings that are 11-inch by 17-inch in size.

c. Furnish Loop Drawings for each monitoring and control loop. Prepare Loop Drawings in accordance with the latest edition of ISA Standard S5.4, Instrument Loop Diagrams. Provide drawings sized 11 inches by 17 inches. Include all information required by the standard. Show separate partitions for field devices, junction boxes, marshalling cabinets, control panels, motor control centers, PLC panels, and PCS/SCADA cabinets, as applicable. Identify all interconnections,

cables, wire numbers, wire colors, terminal blocks, terminal numbers, grounding, shielding, power sources, network connections, and I/O assignments. Submit drawings in native AutoCAD (.dwg) and PDF formats. Include the following information for each loop:

1) Functional name and loop number.
2) ISA tag numbers as shown in the Specifications and on the Contract Drawings.
3) Functional description and manufacturer's model, product or catalog number for each item in the loop.
4) Surge suppressors and intrinsically safe devices.
5) Location of each device.
6) Analog signal ranges and engineering units.
7) HART, Modbus RTU, Modbus TCP/IP, EtherNet/IP, and other digital communication protocols and network interfaces, where applicable.
8) Junction boxes and terminations.
9) PLC, PAC, remote I/O, rack, slot, channel, and network addressing information, where applicable.
10) Identify the source of power for each device, including power supply or panel designation and voltage, where applicable. Power conductors shall be shown only to the extent necessary to identify the source of power. Detailed routing, sizing, and identification of power conductors shall be provided under Division 26 and are not required on loop drawings.
11) Show all loops in their entirety, including all field wiring, panel wiring, interposing relays, motor starters, eddy current drives, packaged equipment control panels, communication devices, and devices furnished under other Divisions. Identify all termination cabinets, marshalling cabinets, and panel terminal numbers, wire numbers, selector switch contact status for each switch position, and normally open or normally closed status of all relay and switch contacts.
12) Identify installed spare conductors and spare terminal block positions, where provided.

I. Human Machine/Operator Interface Submittals:

1. Refer to Section 406863 "Configuration of HMI Software" for specific submittal requirements.

J. Controller Program Submittal:

1. Refer to Section 406866 "Configuration of Controller Software" for specific submittal requirements.

K. Testing Plan Submittals:

1. Refer to Section 406121.20 "Process Control System Testing" for specific testing submittal requirements.

L. Industrial Control System Cybersecurity Submittals:

1. Refer to Section 408100 “Industrial Control System Cybersecurity” for specific submittal requirements.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For any named PCSS, submit a statement on company letterhead indicating that the requirements in the “Quality Assurance” paragraph below are met by the firm.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For all PCSS supplied hardware to include in operation and maintenance manuals.

1. Submit in accordance with Section 017823 “Operation and Maintenance Data.”
2. Include the following information on the operations and maintenance manuals:

a. Table of Contents:

1) Provide a Table of Contents for the entire manual with the specific contents of each volume clearly listed. Include the complete Table of Contents in each volume.

b. Instrument and Equipment Lists:

1) Develop the following lists in Microsoft Excel format:

a) An instrument list or spreadsheet for all instruments supplied including tag number, description, specification section and paragraph number, manufacturer, model number, calibrated range, location, manufacturer phone number, local supplier name, local supplier phone number, completion year replacement cost, and any other pertinent data.
b) An equipment list or spreadsheet for all non-instrument devices supplied listing description, specification section and paragraph number, manufacturer, model number, location, manufacturer phone number, local supplier name, local supplier phone number, completion year replacement cost, and any other pertinent data.

c. Equipment Operations and Maintenance Information:

1) Provide ISA-TR20.00.01-2001 (updated in 2004-2006) data sheets for all field instruments. For non-field instrumentation devices, provide a cover page for each device, piece of equipment, and OEM software that lists date, specification number, product name, manufacturer, model number, Location(s), and power required. Preferred format for the cover page is ISA-TR20.00.01-2001(updated in 2004-2006), general data sheet; however, other formats will be acceptable provided they contain all required information.
2) Provide either new documentation written specifically for this project or modified standard vendor documentation to the vendor O&M

documentation for each device, piece of equipment, or OEM software. Indicate with arrows or circles all portions that apply to all standard vendor documentation furnished. Neatly line out or cross out all portions that do not apply. Remove groups of pages or sections that do not apply to the specific model supplied.

3) Provide the record documentation of the completed test forms with sign-offs.
4) Include instrument/equipment calibration and configuration forms.

d. As-Built Drawings:

1) Complete as-built drawings, including all drawings and diagrams specified in this section under the "Submittals" section. Include on the drawings all termination points on all equipment the system is connected to, including terminal points of equipment not supplied by the PCSS. Provide electronic files for all drawings produced. Provide drawings in AutoCAD ".dwg" format and in Portable Document Format (".pdf") format. Provide drawings using the AutoCAD eTransmit feature to bind external references, pen/line styles, fonts, and the drawing file into individual zip files.
2) Include on as-built documentation information from submittals, as described in this Specification, updated to reflect the as-built system. Incorporate errors in or modifications to the system resulting from the Factory and/or Functional Acceptance Tests.

B. Operations and Maintenance Data - Software Maintenance Manual:

1. Include these manuals as part of "Final System Documentation."
2. Software Listings and Databases – Submit hard copies of the same information required in the "Controller Program Submittal." Ensure all files are updated to reflect the as-built system . Include ".pdf" versions of these files on electronic media specified below.
3. PID Loop Tuning Parameters – Submit annotated chart recorder traces or computer system trend screen printouts showing tuned control loop response to plus and minus 40 percent of full span step changes of loop setpoint for each individual loop. For cascade loops, submit charts showing response of the secondary loop with secondary setpoint on manual and also response of the entire cascade control loop in automatic mode. Include a description of tuning methodology used.
4. Supply hardcopies of configuration information for the HMI systems, reporting systems, Historian Systems, and any other programs developed under this Contract.
5. Machine Readable Documentation – Provide two sets of as-built software documentation in original electronic format for all PLC, HMI systems, reporting systems, Historian Systems, and any other programs developed under this Contract. Deliver documentation on modern portable media such as USB flash drives or secure cloud-based storage (e.g., SharePoint, OneDrive, or Engineer approved platforms). Ensure all files incorporate all changes made during or after testing, start-up, and commissioning.
6. Include final version of the system standards and conventions manual reflecting as-programmed conditions.
7. System Configuration Section:

a. Include a printout (or screen capture) of all configuration screens for every device requiring PCSS configuration. This includes, but is not limited to, the hardware firewall**,** site to site VPN routers**,** MES'**,** PLC processors**,** PLC redundancy**,**

EtherNet/IP and any other communication modules, as well as HMI software and any other software.

C. Operations and Maintenance Data - Operators' Manual:

1. Provide Operator's Manuals prior to final acceptance of the system.
2. Separately bind and include in the manual all information necessary for the operator to monitor and control the plant from the control system. Write the manuals in non-technical terms and organize for quick access to each detailed description of the operator's procedure. Include the following information:

   a. A comprehensive table of contents of the manual.
   b. A simple overview of the entire system indicating the function and purpose of major control system components described by area or building.
   c. A detailed description of the operation of the HMI and OIT including all appropriate displays. Including a screenshot of each HMI and OIT display screen and annotating each function in text is an acceptable format for presenting this information.
   d. Step-by-step procedures for starting up or shutting down critical component of the control system such as server or a control panel.
   e. Login / logout procedures for the operator interface system(s).
   f. Complete, step-by-step procedures for printing reports and entering manual data.
   g. Complete, step-by-step procedures for performing system or selected file backup and restoration including archiving historical data. Include recommended archiving schedule for historical data and/or frequency system performs an automatic back-up with a listing of all applications that are backed up or need to be backed up.
   h. Operational description for operating HMI computer equipment and peripherals including printers, CD-ROMs, removable bulk storage devices, UPS, etc. Include in the description procedures for typical maintenance and troubleshooting tasks.
   i. A complete glossary of terms and definition of acronyms.
   j. List of personnel to be contacted for warranty and emergency services, including name, address, telephone number, pager or cell phone number, fax number, and email address.

D. Software and Firmware Operational Documentation:

1. Original Licensed Software:

   a. Submit original software licenses and keys for all software provided under this Contract. Submit original paper based and electronic documentation for all software provided. Submit license agreement information including serial numbers, license agreements, User Registration Numbers, and related information. Provide licenses for all software under this Contract to the Owner at the time of purchase. Provide media in software sleeves within O&M manual.

E. Electronic O&M Information:

1. In addition to the hard copy of O&M data, provide an electronic version of all equipment manuals and data sheets, along with any software back-up of configuration files, on USB flash drives or secure cloud-based storage (e.g., SharePoint, OneDrive, or Engineer approved platforms). Supply electronic documents in ".pdf" format.

2. Provide electronic files for all custom-developed manuals including training manuals. Supply text in Microsoft Office and ".pdf" formats.
3. Provide electronic files for all drawings produced. Supply drawings in AutoCAD ".dwg" and in ".pdf" formats. Provide drawings using the AutoCAD eTransmit feature to bind external references, pen/line styles, fonts, and the drawing file into individual zip files.
4. Back up each computer system hardware device onto USB flash drives or secure cloud-based storage (e.g., SharePoint, OneDrive, or Engineer approved platforms) after Substantial Completion and turn over to the Owner.
5. If specified in the training section, provide digital copies of all training videos onto USB flash drives or secure cloud-based storage (e.g., SharePoint, OneDrive, or Engineer approved platforms).

F. Include information as specified in Section 017823 "Operation and Maintenance Data" on the cover and edge of each volume.

1.8 MAINTENANCE MATERIAL SUBMITTAL

A. Furnish extra materials from the same product run**,** that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Refer to individual specification sections in Division 40 for spare equipment requirements and provide one comprehensive spare parts submittal for project.
2. Submit unit and total costs for the additional spare items and test equipment specified or recommended for each subsystem.

B. Pack all spare parts and test equipment in individual cartons and label with indelible markings clearly indicating component(s) inside. Supply with the required spare parts complete ordering information paperwork including manufacturer's contact information (address and phone number), part name, part number, equipment name and tag number(s) for which the part is to be used (if applicable). Deliver and store the spare parts in a location directed by the Owner or Engineer.

1.9 QUALITY ASSURANCE

A. Manufacturer Qualifications: PCSS to hold a valid UL-508 certification for their panel fabrication facility.

B. Responsible for the technical supervision of the installation by providing on-site supervision to the installers of the various components.

C. The Process Control System Supplier (PCSS) to be a "systems integrator" regularly engaged in the design and the installation of instrumentation systems and their associated subsystems as they are applied to the municipal water and wastewater industry. For the purposes of this Specification Section, a "systems integrator" means an organization that complies with all of the following criteria:

1. Employs personnel on this project who have successfully completed ISA or manufacturer's training courses on general process instrumentation and configuration and implementation of the specific programmable controllers, computers, and software

proposed for this project. Key personnel to hold ISA CCST Level 1 certification or have a minimum of 10 years of verifiable plant startup experience. Key personnel includes, as a minimum, the lead field technician.

2. Has successfully completed work of similar or greater complexity on at least three previous projects within the last five years. Successful completion is defined as a finished project completed on time, without any outstanding claims or litigation involving the PCSS. Potential references for projects where the PCSS's contract was of similar size to this project.
3. Has been actively engaged in the type of work specified in this Section for a minimum of five years.

D. Maintain a permanent, fully staffed and equipped service facility within 150 miles of the project site with full-time employees capable of designing, fabricating, installing, calibrating, and testing the systems specified herein. Respond to on-site problems within 12 hours of notice. Provide an on-site response within four hours of notification starting at two months before scheduled startup to two months after startup completion.

E. Listed suppliers will not be required to submit a qualifications proposal (see “Informational Submittals”). Contractors interested in listing an equal to the above listed suppliers to submit PCSS' qualifications for review and approval as specified herein.

F. Select a PCSS from one of the following:

1. Aaron Associates – Waterbury, CT – Carmen Corvigno – (203) 753-1536
2. Allied Control Services, Inc. – West Point, PA – Paul Mamzic – (215) 699-2855
3. Automated Control Concepts Inc. – Neptune, NJ – Arlene Weichert – (732) 922-6611
4. Optimum Controls Corporation – Reading, PA – James Brunell – (610) 375-0990
5. PCS Integrators – Fairfield, NJ 07004 – Stephen Mirsky – (973) 575-7464
6. Or equal.

G. Being listed in this specification does not relieve any potential PCSS from meeting the qualifications specified in this Section.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 016000 "Product Requirements" for delivery, storage, and handling requirements.

1.11 FIELD CONDITIONS

A. Environmental Requirements: Refer to Electrical Drawings for specific environmental and hazardous area classifications.

B. Elevation: Design equipment to operate at the project ground elevation.

C. Temperature:

1. Outdoor area equipment to operate between -4 to 122 degrees Fambient.

2. Equipment in indoor locations operate between 50 to 95 degrees Fdegrees ambient minimum.
3. Storage temperatures range from 32 to 122 degrees Fdegrees ambient minimum.
4. Furnish additional cooling or heating if required by the equipment specified herein.
5. Relative Humidity. Air-conditioned area equipment operate between 20 to 95 percent relative, non-condensing humidity. All other equipment operates between 5 to 100 percent relative, condensing humidity.

D. Do not ship control system equipment located in the control room until the control room areas comply with specified ambient temperature and humidity and free of dust and debris.

1.12 WARRANTY

1. Warranty Period: Two years from date of Substantial Completion unless noted otherwise in individual specification sections.

PART 2 - PRODUCTS

2.1 GENERAL

A. Electrical Requirements for Control System:

1. Operate equipment on a 60 Hertz alternating current power source at a nominal 120 volts, plus or minus 10 percent, except where specifically noted. Regulators and power supplies required for compliance with the above to be provided between power supply and interconnected instrument loop. Supply constant voltage transformers where equipment requires voltage regulation.
2. With the exception for field device network connected devices, all electronic instrumentation utilize linear transmission signals of isolated 4 to 20 mA DC (milliampere direct current) capable of driving a load up to 750 ohms, unless specified otherwise. However, signals between instruments within the same panel or cabinet may be 1-5 VDC (volts direct current).
3. Outputs of equipment that are not of the standard signals as outlined, have the output immediately raised and/or converted to compatible standard signals for remote transmission. No zero-based signals will be allowed.
4. All switches have double-pole, double-throw (DPDT) contacts rated at a minimum of 600 VA, unless noted otherwise.
5. Switches and/or signals indicating an alarm, failure or upset condition wired in a fail-safe manner as shown on the P&IDs**.** A fail-safe condition is when an open circuit generates an alarm state (i.e. contact opens).
6. Materials and equipment UL approved whenever such approved equipment and materials are available.
7. All equipment furnished designed and constructed so that in the event of power interruption, all systems specified go through an orderly shutdown with no loss of memory and resume normal operation without manual resetting when power is restored, unless otherwise noted.

8. Surge protection requirements for control system power, signal, and communication lines are specified in Section 407856 “Isolators, Intrinsically Safe Barriers, and Surge Suppressors.”

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for maximum moisture content, installation tolerances and other conditions affecting performance of the Work.

B. Examine products or materials before installation. Reject products that are wet, moisture damaged, or mold damaged.

C. Examine walls, floors, roofs, and process area for suitable conditions where control panels and instrumentation will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 GENERAL INSTALLATION

A. In addition to the scope of work within the Main Equipment Building, the PCSS shall trace, identify, label, disconnect, and reconnect existing control signals affected by the replacement of Sludge Gate Actuator SG-1 in the Influent Screenings Building. Existing PLC terminal blocks within the existing PMCP shall be reused where practical. The PCSS shall verify proper termination and operation of signal conductors. The PCSS shall modify the PMCP PLC program as required to maintain existing control, monitoring, alarm, status, and SCADA functions associated with SG-1. Upon completion of the Work, the PCSS shall perform I/O verification, loop checks, and functional testing of affected signals and demonstrate that the PMCP PLC and SCADA functionality has been fully restored and operates as intended.

B. The shield on each process instrumentation cable to be continuous from source to destination and be grounded at only one ground point for each shield.

C. Provide sunshades for equipment mounted outdoors in direct sunlight. Include sunshades standoffs to allow air circulation around the cabinet. Orient equipment outdoors to face to the North to minimize the impact of glare and ultraviolet exposure on digital readouts.

3.3 IDENTIFICATION

A. Provide identification system for all PCSS provided hardware, instrumentation, and communication cabling.

3.4 FIELD QUALITY CONTROL

A. Refer to individual hardware and instrument specification sections.

© 2026 CDM Smith
All Rights Reserved

3.5 STARTUP SERVICE

A. Refer to Section 406121.20 “Process Control System Testing.”

B. Refer to Section 406126 “Process Control System Training.”

C. Engage a factory-authorized service representative to perform startup service as specified in individual hardware and instrument specification sections.

D. Weekly on-site coordination meetings with Engineer, Contractor, Vendors**,** and as required during active construction period.

3.6 PCSS MAINTENANCE SERVICE

A. Maintenance Service: Beginning at Substantial Completion, maintenance service includes 12 months' full maintenance by skilled employees of systems and equipment Installer. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper operation. Parts and supplies to be manufacture's authorized replacement parts and supplies.

B. Provide a written proposal for a maintenance contract executed by the PCSS to the Owner for on-site preventive maintenance services related to the Instrumentation and Control system. Do not include the cost of this maintenance contract in the Contract Price.

C. Provide a proposal within 30 days after Substantial Completion for the purpose of entering a contract for annual maintenance subsequent to the first year of maintenance. Set forth standard per diem rates to provide breakdown service in the contract. Such rates to be fair and reasonable and reflect the lowest rates offered to most favored customers. The fee quoted to be firm for a minimum of 90 days from date of issue.

D. Include on maintenance contract all labor, parts, and emergency calls providing on-site response within 24 hours, to provide complete system maintenance for a period of one year after the date of Substantial Completion of the system for all equipment, instrumentation and software provided as part of the PCSS scope of work.

E. Provide software updates throughout the maintenance contract period. Provide latest official released version for all software provided under this Contract. Owner to have the latest software releases at the end of the maintenance contract period.

F. Include on maintenance contract a minimum of 4 preventive maintenance visits by qualified service personnel of the Supplier who is familiar with the type of equipment provided for this project. Include in each preventive maintenance visit routine adjustment, calibration, cleaning and lubrication of system equipment and verification of correct operation.

G. Visits to the sites to correct deficiencies under warranty are not included in this preventive maintenance service contract.

H. Emergency maintenance procedures or plant visits may coincide with a preventive maintenance visit; however, they do not replace the work intended to be performed during a preventive

maintenance visit. The Supplier has full responsibility for the system hardware preventive and corrective maintenance.

I. Provide observation of maintenance operations by plant personnel and the instruction of said personnel in the details of the maintenance work performed during the one-year maintenance period.

3.7 SOFTWARE SERVICE AGREEMENT

A. Refer to individual hardware and software specifications for specific requirements.

SECTION 406121.20 - PROCESS CONTROL SYSTEM TESTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes process control system testing, where the Applications Engineering services are performed by the Contractor.

B. Related Requirements:

1. Section 019113 “General Commissioning Requirements.”
2. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
3. Section 408100 “Industrial Control System Cybersecurity.”

C. Furnish all labor, materials, equipment and incidentals required to complete the testing of all devices and systems furnished and installed as detailed on Drawings, and as specified herein.

1.3 DEFINITIONS

A. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

B. Applications Engineering System Supplier (AESS): The entity who provides all programming, configuration, and related services for the control system equipment provided by the PCSS.

C. Human Machine Interface (HMI): A software-based user interface with supervisory level control and of machine level equipment.

D. Operator Interface Terminal (OIT): A hardware component of the HMI used for device level control and monitoring.

E. Programmable Logic Controller (PLC): A ruggedized programmable computer used for industrial automation.

F. Input/Output (I/O): Analog or digital field instrument signals to be received and interpreted by a PLC.

G. Uninterruptible Power Supply (UPS): A device capable of providing emergency battery power when the main power source fails.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Refer to Section 4061000 “Process Control and Enterprise Management Systems General Provisions.”

1.5 ACTION SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

B. Testing Submittals - Submit, in one submittal, the following testing related documents:

1. Status signoff forms:

a. Develop and submit project specific I/O Status and Automatic Control Strategy signoff forms to be used during factory and field testing to organize and track each loop's inspection, adjustment, calibration, configuration, and testing status and sign off. Include sign-off forms for each testing phase showing all loops.

1) Example forms are shown in the Appendices.
2) Separate forms for factory and field testing can be used, or they can be combined, at the discretion of the PCSS.
3) Submit testing forms prior to start of testing.

1. Testing Procedures:

a. Submit detailed procedures proposed to be followed for each of the tests specified herein. The test procedures serve as the basis for the execution of the required tests to demonstrate that the system meets and functions as specified. At a minimum, provide the following test procedures:

1) Network and Communications Testing.
2) I/O Testing.
3) UPS.
4) Control panel power, indicators, and hardwired logic tests.

b. Structure documents in an orderly and easy to follow manner to facilitate an efficient and comprehensive test.
c. Indicate in test procedures all pre-testing setup requirements, all required test equipment, and simulation techniques to be used.
d. Structure test procedures in a cause and effect manner where the inputs are indicated, and the outputs are recorded.
e. Include in test procedures the demonstration and validation under normal operating conditions and under various failure scenarios as specified in Contract Documents.
f. Do not start testing until all Testing Submittals have been approved.

C. Test Documentation:

1. Upon completion of each required test, document the test by submitting a copy of the signed off Testing Status forms. Testing is not considered complete until the signed-off

forms have been submitted and approved. Submittals of other test documentation, including "highlighted" wiring diagrams with field technician notes, are not acceptable substitutes for the formal test documentation.

1.6 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For Test Documentation of system:

1. Upon completion of each required test, document the test by submitting a copy of the signed-off Testing Status forms. Testing is not considered complete until the signed-off forms are submitted and approved. Submittal of other test documentation, including "highlighted" wiring diagrams with field technician notes, are not acceptable substitutes for the formal test documentation.

1.7 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.8 COST OF TRAVEL

A. Scheduled tests will only be attended once by Engineer /Owner. If test is not successful, all subsequent tests will be performed at Contractor's expense. Reimburse Owner for all costs, including labor and expenses, invoiced by Engineer and incurred by Owner for subsequent retests.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 TESTING - GENERAL

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

B. Track results of all testing on a project specific status sign-off form or similar document. The PCSS is responsible for maintaining the sheet. Appendix of this Section has an example template for this sheet.

C. Tests the PCSS is required to perform are as follows:

1. Factory Testing:

a. Unwitnessed Factory Test (UFT).
b. Witnessed Factory Test (WFT).

2. Field Testing:

    a. Operational Readiness Test (ORT).
    b. Functional Demonstration Test (FDT).
    c. Site Acceptance Test (SAT).

D. Wherever possible, perform tests using actual process variables, equipment, and data. Where it is not practical to test with real process variables, equipment, and data, provide all special testing materials and equipment required for a suitable means of simulation.

E. PCSS to coordinate all required testing with Contractor, affected Subcontractors, Engineer, and Owner.

F. Do not ship equipment to jobsite until Engineer or Owner has received all Factory Testing results and approved the system as ready for shipment.

G. Engineer reserves the right to test or re-test any functions.

H. Correction of Deficiencies:

1. Correct deficiencies in workmanship and/or items not meeting specified testing requirements to meet specification requirements at no additional cost to Owner.
2. Repeat testing, as specified herein, after correction of deficiencies is made until specified requirements are met. Perform work at no additional cost to Owner.

I. Separate factory tests for panel enclosure hardware and software may be performed if submitted and approved by the Engineer. If this option is proposed by the PCSS the following must be indicated:

1. General description of why the PCSS is requesting hardware and software tests to be performed separately.
2. General overview of the tests to take place.
3. Information on what measures will be taken to ensure that there will be no impact to the overall test quality.
4. Confirmation that payments provided for panels delivered to the site prior to completion of software test will be partial and reflected in the schedule of values.

3.2 FACTORY TESTING - UNWITNESSED FACTORY TEST (UFT)

A. Purpose of UFT is for PCSS to check system prior to Engineer and/or Owner attending factory testing. This type of testing is part of any quality firm's internal QA/QC procedures.

B. Temporary network connections are required to confirm the network configuration. Temporary wiring of primary elements, final control elements, and field-mounted transmitters is not required.

C. Hardware to be tested includes all control system devices shown on System Architecture drawings and provided by PCSS.

D. Perform these tests, but not limited to the following. Address each of these tests in the Test Procedure submittal.

1. All panels and enclosures provided to undergo a thorough inspection to verify integrity of cabinet enclosures, frame structures, paint work and finish, etc. Review panel drawings to ensure they accurately reflect panel layout and wiring.
2. Perform a system audit to verify all components have been staged for test and have been documented properly with correct model numbers, serial numbers, etc. Prove documentation of audit at factory test and submit as part of O&M Manual Documentation:

    a. For each workstation and server, list of all software installed (including the operating system), with software revision number, software improvement modules or patches installed, license number and owner registration information, warranty period, vendor and local distributor names and contacts.
    b. For each microprocessor-based component connected to control communication backbone in system (PLCs, managed switches, protocol converters, communication cards on final field devices, radios, etc.), list firmware revision, vendor and local distributor information, and system, warranty information, configuration parameters (e.g., communication settings, fail position settings, etc.)

3. Perform panel wire pull tests to ensure all wiring has been connected with appropriate torque to prevent wires from coming loose.
4. Test UPS to verify UPS switch power correctly while keeping all UPS powered loads online. Perform testing of UPS to determine if they have been sized correctly to maintain specified run time during field testing.
5. Perform a 100 percent I/O point checkout to verify proper operation of input/output points from panel terminations to HMI and OIT nodes. At a minimum, I/O checkout consists of four steps.

    a. Jumper discrete input signals at field terminal blocks in control panels to verify proper status in HMI and OIT nodes.
    b. Connect analog input signals to a signal generator at field terminal blocks in control panels to verify proper status in HMI and OIT nodes and verify signals are at zero percent, 50 percent, and 100 percent of full scale.
    c. Test discrete output signals by switching equipment to manual control at HMI and OIT nodes and turning the output on or other means to turn the output on. Then verify the output is on by connecting a digital multimeter to measure continuity at terminations, thus verifying command from PLC has properly executed contact closure.
    d. Test analog output signals by switching the equipment to manual control at HMI and OIT nodes and turning output on or other means to turn the output on. Then verify output by utilizing a digital multimeter to measure current or voltage generated at termination points.

6. Verify all control strategies using simulation or other means to verify logic performs as expected. Verify faults and logical failure conditions for control strategies such instrument failures, equipment failures, loss of communication between HMI Server and PLC, loss of peer-to-peer communication, out of range testing (over and under scale) for analog inputs, and all other strategies specified in control strategy document.

7. For each hardware enclosure, include with inspection, but not be limited to, cabinet enclosures, frame structure, paint work and finish, dimensions, and hardware operability (i.e., fans, door hinges, keylocks, etc.).
8. For each subpanel, include with inspection, but not be limited to, I/O subsystem physical layout, power supply sizing and mounting, cable routing, wire runs across hinges properly installed, fans and blowers unobstructed and mounted to maximize air flow, power conditioning correctly installed, and overall layout and installation of components meets manufacturer's recommendations and standard industry accepted practices.
9. All other control panel circuitry.
10. Perform the following systems tests:

    a. Demonstrate ability to share data between operator workstations and servers.
    b. Demonstrate ability of each workstation to print reports on all designated report printers.
    c. Demonstrate ability for each workstation to read and write designated files from servers and other workstations on the network.
    d. Demonstrate operability of all back-up and mass storage equipment.
    e. Demonstrate communication failure and recovering self-healing ring testing.
    f. Demonstrate total power failure and recovery. Remove the UPS for this test.
    g. Demonstrate capabilities of the historical server.
    h. Demonstrate failover capabilities of the redundant HMI servers.
    i. Demonstrate failover capabilities of the redundant PLCs.

E. Upon successful completion of UFT, PCSS to submit a record copy of test results as specified in PART 1. As part of this test results submittal, notify Engineer and Owner in writing that system is ready for WFT. No other notice of Factory test will be accepted. Engineer and/or Owner to schedule a test date within 30 days of receipt of this submittal.

3.3 FACTORY TESTING - WITNESSED FACTORY TEST (WFT)

A. Purpose of WFT is to allow Engineer or Owner representatives to witness functionality, performance, and stability of entire hardware and software system as a complete integrated system. WFT to be run by PCSS and conducted at PCSS's facility.

B. Required Documents for Test:

1. Clean set of approved panel drawings and wiring diagrams.
2. Set of Contract Documents - all drawings and specifications.
3. All design-change related documentation.
4. Master copy of the PCSS developed factory testing signoff forms.
5. Testing procedures.

C. Operate the system continuously throughout WFT without failure, except where initiated per established test procedures. Unanticipated failures may, at Owner or Engineer's option, result in overall WFT being deemed unsuccessful. Correct and re-test all deficiencies identified during these tests prior to completing WFT or shipment of panels to jobsite as determined by Owner/Engineer.

D. Perform these tests during the WFT, but not be limited to, the following:

1. A repeat of all tests specified in the UFT.

E. Daily schedule during these tests to be as follows:

1. Morning meeting to review the day's test schedule.
2. Scheduled tests and sign-offs.
3. End of day meeting to review day's test results and to review or revise next day's test schedule.
4. Unstructured testing period by witnesses.

F. Upon successful completion of WFT, PCSS to submit a record copy of test results as specified in PART 1.

3.4 FIELD TESTING - OPERATIONAL READINESS TEST (ORT)

A. Purpose of ORT is to check that process equipment, instrument installation, instrument calibration, instrument configuration, field wiring, control panels, and all other related system components are ready to monitor and control the processes. This test determines if equipment is ready for operation.

B. This test to take place prior to FDT and startup. Prior to starting this test, install relevant process equipment and mechanically test instruments installed, control panels installed, and field wiring complete.

C. Required Documents for Test:

1. Master copy of the PCSS developed field testing sign-off forms.
2. Testing procedures.
3. Calibration forms.

D. These inspections, calibrations, and tests do not require witnessing. However, Engineer may review and spot-check testing process periodically. All deficiencies found to be corrected by PCSS prior to commencement of Functional Demonstration Test.

E. PCSS to maintain Sign-off forms and Calibration forms at job site and make them available to Engineer/Owner at any time.

F. Perform the following tests as part of ORT:

1. Instrument calibration, configuration, and set-up.
2. Input/Output (I/O) Testing to HMI and OITs.
3. Testing of control strategies.

G. Instrument calibration, configuration, and set-up:

1. Calibrate, configure, and set-up all components and instruments to perform specified functions.
2. Calibration form:

a. For any component or instrument requiring dip switch settings, calibration, or custom configuration, maintain a calibration form in field documenting this

information. These forms provide a summary of the actual settings used in the field to allow an Instrument technician to replace the device entirely and configure it to function as it did before.

b. Add this information to Instrument data sheet and to a copy of manufacturer's standard "Configuration Sheet", or create a separate form.

1) If a separate form, list Project Name, Loop Number, ISA Tag Number, I/O Module Address, Manufacturer, Model Number/Serial Number, Output Range and Calibrated Value.

c. Some examples of required information are:

1) For Discrete Devices: Actual trip points and reset points.
2) For Instruments: Any configuration or calibration settings entered into instrument
3) For Controllers: Mode settings (PID).
4) For I/O Modules: Dip switch settings, module configuration (if not documented in native programming documentation).

d. Maintain a copy of these forms in field during testing and make them available for inspection at any time.

e. For any device that allows a software back-up of configuration files to a laptop, make configuration files available to Engineer/Owner for inspection. Submit as part of Final System Documentation as specified in Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

H. I/O Testing:

1. Purpose of I/O testing is to check that process equipment, instrument installation, calibration, configuration, field wiring, and control panels are set-up correctly to monitor and control the processes. This test is commonly referred to as a "loop test" or an I/O checkout.
2. PCSS in conjunction with Contractor to test signals under process conditions. Preferred test method will always be to execute test wherever possible to end elements. For example, preferred test will prove valve open/close limit switches by operating valve, not by installing a jumper on limit switch contacts. However, if equipment or process is not available to test a signal over its entire calibrated range, PCSS may test using a simulation method and make a note on sign-off form.
3. Perform the following I/O tests:

a. Discrete Input: At device or instrument, change signal condition from inactive to active state. Observe results on all indicators within loop such as HMI screens, OIT screens, pilot lights, horns, beacons, etc.

b. Analog Input: Test analog signal over entire engineering range at various intervals including 0, 50%, and 100% as well as on increasing and decreasing range. Observe results on all indicators within loop such as HMI screens, OIT screens, recorders, digital indicators, etc.

c. Test discrete output signals by switching equipment to manual control at the HMI and OIT nodes and turning output on or using other means to turn output on. Then verify equipment responds accordingly.

d. Test analog output signals by switching equipment to manual control at HMI and OIT nodes and turning output on or other means to turn output on. Then verify equipment responds accordingly.

I. Testing of Automatic Control Strategies:

1. Verify all automatic control strategies using actual process equipment and instruments, or other means, to verify logic performs as expected. Verify faults and logical failure scenarios for control strategies such as instrument failures, equipment failures, loss of communication between HMI Server and PLC, loss of peer-to-peer communication, out of range testing for analog inputs, loss of power, and all other strategies specified in control strategy document.

J. Repeat all systems tests specified under factory testing.

K. Test UPS to verify UPS switch power correctly while keeping all UPS powered loads online. Also, test sizing of UPS by switching off-line power to UPS and verify if they maintain specified run time.

L. For all panels with enclosures modified by this Contract, test internal control panel temperature under full running conditions to ensure proper cooling/ventilation is being provided.

M. Upon successful completion of ORT, PCSS to submit a record copy of test results as specified in PART 1 and request scheduling of FDT.

3.5 FIELD TESTING - FUNCTIONAL DEMONSTRATION TEST (FDT)

A. After facility is started-up and running treatment process in automatic control to extent possible, perform a Functional Demonstration Test. Purpose of FDT is to allow Engineer or Owner representatives to witness actual functionality, performance, and stability of system while connected to process equipment.

B. Required Documents for Test:

1. Set of panel drawings and wiring diagrams from ORT with corrections noted.
2. Set of Contract Documents - all drawings and specifications.
3. All design-change related documentation.
4. Signed-off master copy of the PCSS developed field testing signoff forms.
5. Testing procedures.
6. Copy of completed calibration forms.
7. One copy of all O & M Manuals for PCSS supplied equipment.

C. Perform a witnessed FDT on each process area. To extent possible, repeat testing performed during ORT.

D. Follow specified daily schedule during factory tests and FDT.

E. After coordinating with Operations, perform a "Black Start" of the plant to confirm plant operation recovers as specified in Contract Documents. Black start means shutting off power to

the plant and turning it back on. Perform separate tests by recovering the plant while on generator (if a generator is specified) and while on utility power.

F. Document punch list items and resolutions noted during test on Punch list/Resolution form. In event of rejection of any part or function test procedure, PCSS to perform repairs, replacement, and/or retest within 10 days.

G. Upon successful completion of the FDT, PCSS to submit a record copy of test results as specified in PART 1.

3.6 FIELD TESTING - SITE ACCEPTANCE TEST (SAT)

A. After completion of FDT, and system is started-up and running treatment process in automatic control to extent possible, perform a test on the system as defined in Section 019113 “General Commissioning Requirements.”

B. While this test is proceeding, Engineer and Owner have full use of system. Only allow plant operating personnel to operate equipment associated with live plant processes. Plant operations remain the responsibility of Owner and decision of plant operators regarding plant operations are final.

C. During this test, PCSS personnel to be present as required to address any potential issues that would impact system operation. PCSS is expected to provide personnel for this test who have an intimate knowledge of hardware and software of system. When PCSS personnel are not on-site, PCSS to provide cell phone/pager numbers that Owner personnel can use to ensure that support staff is available by phone and/or on-site within four hours of a request by operations staff.

D. PCSS to analyze and correct any malfunctions during test. In event of rejection of any part or function, PCSS to perform repairs or replacement within 5 days.

E. Throughout duration of SAT, do not make software or hardware modifications to the system without prior approval from Owner or Engineer.

APPENDIX **40 61 21-**A: EXAMPLE INPUT/OUTPUT (I/O) STATUS SIGN OFF FORM

An example template for I/O Status signoff form to be used for documenting testing results to Owner is attached. PCSS is required, prior to testing, to create a project specific I/O Status signoff form based on attached template or approved equal. PCSS may obtain an electronic copy of template from Engineer or develop it on their own.

APPENDIX **40 61 21**-B: EXAMPLE AUTOMATIC CONTROL STRATEGIES SIGN OFF FORM

An example template for Automatic Control Strategies signoff form to be used for documenting testing results to Owner is attached. PCSS is required, prior to testing, to create a project specific Automatic Control Strategies signoff form based on attached template or approved equal. PCSS may obtain an electronic copy of template from Engineer or develop it on their own. These forms need to be generated for both factory and field tests.

Appendix B – Automatic Control Strategies Sign-Off Form

Checked?

LOOP 0330-1, -2 PUMPS NO. 1 & 2

Drawing Number: I-6

PLC: PLC-02

General: There are two (2) booster pumps that start and stop to maintain a tank level while in the automatic mode.

Control:

Local (LCS):

Hand: When the Hand/Off/Auto selector switch is in the "Local" position, the pump shall be started/stopped and have its speed controlled from the LCS.

Off: When the Hand/Off/Auto selector switch is in the "Off" position, the pump shall be stopped.

Auto: When the Hand/Off/Auto selector switch is in the "Auto" position, the starting, stopping, and speed control of the pump is transferred to the SCADA PLC/HMI. ☐

SCADA PLC/HMI:

Software Interlocks:

If level in the storage tank is low (detected by the ultrasonic level sensor), the pump shall stop and not be allowed to start. ☐

Manual Control:

The pump can be manually started, stopped, or have its speed controlled by the operator at the HMI. ☐

Automatic Control:

The pumps will operate in a duty/standby sequence. ☐

The pumps will adjust speed to maintain level in the tank.

SECTION 406126 - PROCESS CONTROL SYSTEM TRAINING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes process control system training for provided devices and systems.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.4 ACTION SUBMITTALS

A. Preliminary Training Plan Submittal:

1. Prior to preparation of Final Training Plans, submit outlines of each training course including course objectives and target audience, resumes of instructors, prerequisite requirements for each class, and samples of handouts for review.

B. Final Training Plan Submittal:

1. Upon receipt of Engineer's comments on preliminary training plan, submit specific proposed training plan with the following:

a. Definitions, objectives, and target audience of each course.
b. Schedule of training courses including proposed dates, duration, and locations of each class.
c. Complete copy of proposed handouts and training materials bound and logically arranged with materials reduced to a maximum size of 11 inch by 17 inch, then folded to 8.5 inch by 11 inch for inclusion into the binder.

© 2026 CDM Smith
All Rights Reserved

1.5 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 GENERAL

A. Directly relate the training and instruction to the system being supplied. Training program represents a comprehensive program covering aspects of the operation and maintenance of the system.

B. Coordinate training schedules with and at the convenience of Owner, including shift training required to correspond to Owner's working schedule.

C. All onsite instructors must be intimately familiar with the operation and control of Owner's facilities.

D. Provide detailed training manuals to supplement the training courses including specific details of equipment supplied and operations specific to the project. Provide the manuals in hardcopy for each student. Provide electronic copy of each training manual in PDF format for Owner's future use.

E. Make use of teaching aids, manuals, or slide/video presentations as required. After training services, deliver training materials to Owner.

F. Owner reserves the right to videotape custom training sessions. Training tapes become sole property of Owner.

G. Cost of Travel for off-site training:

1. Cost of Travel for off-site training is paid directly by entity employing the staff doing the traveling.

3.2 TRAINING SUMMARY

A. Provide following training courses listed in the summary table below:

Description	**Minimum Course Duration (hours)**	**Maximum Number of Trainees per Course**	**Number of Times Course to be Given**	**Intended Audience**
Onsite Training				
Control System Overview Seminar	Covered in AESS scope of work			

Description	Minimum Course Duration (hours)	Maximum Number of Trainees per Course	Number of Times Course to be Given	Intended Audience
Operator Control System Training	Covered in AESS scope of work			
System Reports and Historian Implementation	Covered in AESS scope of work			
Installed Control System	2	4	2	Maintenance, Administrator
PLC Hardware/Software	2	4	2	Maintenance
Instruments	8	4	2	Maintenance
Instruments - Operator familiarity	2	8	2	Operations

B. Definitions of Audience Roles:

1. Administrator: Personnel responsible for maintaining the HMI / SCADA system.
2. Maintenance: Personnel responsible for maintaining the field controller hardware and instrumentation system.
3. Operations: Personnel responsible for daily plant operations.
4. Management: Non-daily operations personnel.

3.3 MANUFACTURER'S TRAINING

A. Human Machine Interface (HMI) Software:

1. Provide manufacturer's standard training courses for Owner's personnel in configuration, programming, and installation of supplied HMI software. Conduct this course in separate beginner and advanced training sessions.
2. Conduct training no more than two months before Witnessed Factory Test (WFT).
3. Provide training on the following:

    a. Database generation.
    b. Display generation.
    c. Alarm system and configuration.
    d. Historical data system configuration.
    e. Report generation.
    f. Security system.
    g. Trending system.
    h. Remote communications.
    i. Software configuration.
    j. OLE applications.
    k. Test, adjustment, and calibration procedures.
    l. Troubleshooting and diagnosis.

4. Include classroom and hands-on instruction such that a student with experience in process instrumentation can configure the HMI with no guidance or with only minimal supervision when attempting complex problems.

B. Historian:

1. Provide manufacturer's standard training courses for Owner's personnel in configuration, programming, and installation of the Historian software supplied.
2. Conduct training no more than one month before the Witnessed Factory Test (WFT).
3. Provide the following training:

    a. Database generation and configuration.
    b. Trending system.
    c. Using data exporters.
    d. Report generation.
    e. Troubleshooting and diagnosis.
    f. Managing historian Servers & data collectors.
    g. Configuring clients.
    h. Security.
    i. Alarm and Event configuration and archiving.

4. Include classroom and hands-on instruction such that a student with experience in process instrumentation can configure the Historian with no guidance or with only minimal supervision when attempting complex problems.

C. Programmable Logic Controller (PLC) Hardware and Software:

1. Provide manufacturer's standard training courses for Owner's personnel in operation, configuration, programming, installation, and maintenance of the PLC hardware and software supplied. Conduct this course in separate beginner and advanced training sessions.
2. Conduct training no more than two months before the WFT.
3. Provide the following hardware training:

    a. Hardware maintenance for the PLC equipment provided.
    b. Test, adjustment, and calibration procedures.
    c. Troubleshooting and diagnosis.
    d. Component removal and replacement.
    e. Periodic maintenance.

4. Provide the following software training:

    a. System configuration.
    b. Application specific program development/programming.
    c. Uploading/downloading programs.
    d. Documenting program/configuration.
    e. System backups and reload procedures.
    f. TCP/IP addressing procedures.
    g. Network communications configuration.

3.4 ONSITE TRAINING

A. Training personnel are required to be intimately familiar with the control system equipment, its manipulation, and configuration. Training personnel are required to command knowledge of system debugging, program modification, troubleshooting, maintenance procedure, system

operation, and programming, and capable of transferring this knowledge in an orderly fashion to technically oriented personnel.

B. Installed Control System Training:

1. Provide training for Owner's personnel in the functionality, maintenance, and troubleshooting, of the installed Control System. Conduct training before Functional Demonstrator Test (FDT), but not more than two months before.
2. Provide training and instruction specific to the system that is being supplied.
3. Provide training consisting of classroom instructions and hands-on instruction utilizing Owner's system.
4. Provide detailed training on the actual configuration and implementation for this Contract covering aspects of the system that will allow Owner's personnel to maintain, modify, troubleshoot, and develop future additions/deletions to the system. Provide training covering the following subjects:

    a. System overview.
    b. System hardware components and specific equipment arrangements.
    c. Periodic maintenance.
    d. Troubleshooting and diagnosis.
    e. Network configuration, communications, and operation.
    f. TCP/IP addressing procedures for Ethernet devices.

C. Programmable Logic Controller (PLC) Hardware and Software:

1. Provide training for Owner's personnel in operation, maintenance, troubleshooting, etc. with PLC hardware and software system. Conduct the training before FDT, but not more than two months before.
2. Provide training and instruction specific to the system that is being supplied.
3. Provide training consisting of classroom instructions and hands-on instruction utilizing Owner's system. Provide detailed training on the actual configuration and implementation for this Contract covering aspects of PLC system that will allow Owner's personnel to maintain, modify, troubleshoot, and develop future additions/deletions to PLC system. Provide training covering the following subjects:

    a. PLC system overview.
    b. PLC system architecture.
    c. PLC system hardware components and specific equipment arrangements.
    d. PLC system startup, shut down, load, backup, and PLC failure recovery.
    e. Periodic maintenance.
    f. Troubleshooting and diagnosis down to the I/O card level.
    g. PLC configuration, communications, and operation.

D. Instrument Manufacturer Training:

1. Provide manufacturer instrument training for those instruments where specifically indicated in the Instruments section. This is on-site training provided by an authorized representative of the manufacturer. Manufacturer's representative is required to be fully knowledgeable in equipment operation and maintenance.

E. Instrument Training:

1. Provide instruction on the maintenance of the field and panel instrumentation for Owner's instrumentation technicians. Conduct this training before FDT, but no more than 1 month before and at a time suitable to Owner. This training takes place at Owner's facility. Training program is required to include the following elements:

    a. Training in standard hardware maintenance for the instruments provided.
    b. Specific training for the actual instrumentation configuration to provide a detailed understanding of how the equipment and components are arranged, connected, and set up for this Contract.
    c. Testing, adjustment, and calibration procedures.
    d. Troubleshooting and diagnosis.
    e. Maintenance and frequency.

F. Instruments - Operator familiarity:

1. Provide operator level instruction on the use of the field and panel instrumentation for Owner's operations staff.

    a. Conduct training before the 30-day site acceptance test, but no more than 1 month before and at a time suitable to Owner.

        1) Training to take place at Owner's facility.
        2) Include hands on demonstration of information each transmitter indicates, and method used to retrieve operator information from transmitter, including use of pushbuttons and interpretation of international graphic symbols used on the instruments.

G. Fiber Optic Training:

1. Provide instruction on maintenance of fiber optic system for Owner's instrumentation technicians. Conduct training before the FDT, but no more than 1 month before and at a time suitable to Owner. This training takes place at Owner's facility. Provide training covering the following topics:

    a. Fiber cable layout and basic of cable construction.
    b. Termination procedures.
    c. "Jumper" installation.
    d. Testing procedures.
    e. Troubleshooting and diagnosis.

SECTION 406196 - PROCESS CONTROL DESCRIPTIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Applications Engineer System Supplier (AESS) Programming Scope

1. Develop the control system applications to implement the process control descriptions for new and existing systems. This Section is provided to define control strategies to be used for PLC programming of the system.
2. The Contract Documents are a single integrated document, and as such, Drawings, Specifications Divisions and Specifications Sections apply. It is the responsibility of the Contractor and Subcontractors to review Sections to ensure a complete and coordinated project.
3. The PCSS is cautioned to read this Section and related Sections and their entirety prior to starting any programming. Many general control strategies and requirements are defined once in the body of this Section with the specific requirement called out in the individual control strategy. Implement these general strategies throughout this Contract unless specifically directed otherwise in the individual loop process control descriptions.
4. Follow loop and device tagging criteria shown on the Drawings without exception unless approved by the Engineer.
5. Establish programming approach and database/variable identification standards prior to performing any programming work. Review the proposed standards and conventions with the Owner during the coordination workshop required by Section 406863 “Configuration of HMI Software.”

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 406863 “Configuration of HMI Software.”
3. Section 406866 “Configuration of Controller Software.”

1.3 DEFINITIONS

A. Applications Engineering System Supplier (AESS): The entity who provides programming, configuration, and related services for the control system equipment provided by the PCSS.

B. Human Machine Interface (HMI): A software-based user interface with supervisory level control of machine level equipment.

C. Input/Output (I/O): Analog or digital field instrument signals to be received and interpreted by a PLC.

D. Operator Interface Terminal (OIT): A hardware component of the SCADA system used for device level control and monitoring.

E. Operator Workstation (OWS): A hardware component of the SCADA system used for supervisory level control and monitoring.

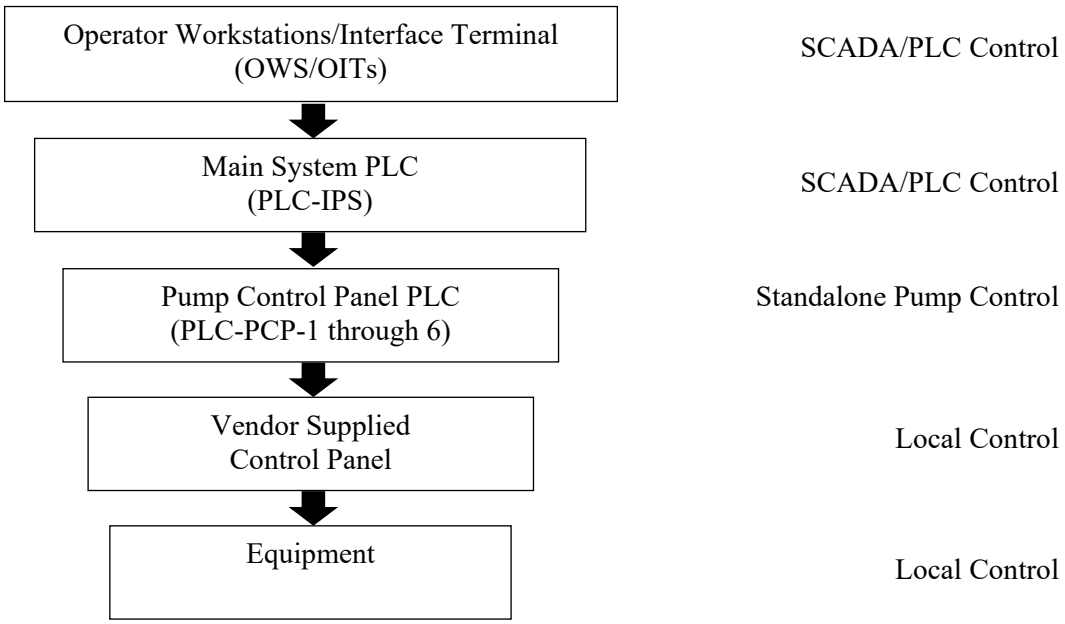
F. Process Control System Supplier (PCSS): The entity responsible for providing materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

G. Programmable Logic Controller (PLC): A ruggedized programmable computer used for industrial automation.

H. Supervisor Control and Data Acquisition (SCADA): Hardware and software components used for high-level supervisory monitoring of industrial processes. Typical devices that are part of the SCADA network include computers (OWS), PLCs, Ethernet switches, OITs, and HMIs.

I. VTMP: Vibration and Temperature Monitoring Panel.

J. VTMS: Vibration and Temperature Monitoring System (one per set of three pumps, as shown).



PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 GENERAL

A. Control System Hierarchy

1. The control descriptions are broken into a hierarchical layer concept. There may be one layer or multiple layers per loop, depending upon that loop. An example of multiple layered loop is shown in Figure 1.

© 2026 CDM Smith
All Rights Reserved

Figure 1. Control System Hierarchy

B. Loop Numbering:

1. Control descriptions are separated into areas and sorted by loop number. The loop index has four columns associated with it; Process Area, Area Number, Loop Number, and Drawing(s). The following is a list of areas and the loop numbers associated with each area.

Process Area	Area Number	Loop Number	Drawing (s)
Screened Wastewater Wet Wells	00	20	I-005 / I-006
Wastewater Pumping	00	50	I-005 / I-006 / I-007
Miscellaneous or Auxiliary Systems (Seal Water)	00	40	I-007
Miscellaneous or Auxiliary Systems	00	60, 70	I-005 / I-006 / I-007
Miscellaneous or Auxiliary Systems	00	90	I-007

2. The loop numbering for each system would be the above numbers, with -99 added onto the end of the area designation. For example, loop numbers associated with the Influent Pumping System would be 0050 to 0099.

3.2 GENERAL CONTROLS AND MONITORING

A. Overview:

1. Hardware and/or software functions noted by this paragraph reference are to be implemented in the PLC control system.
2. Setpoints, as defined by this section, refer to numerical values adjustable from the HMI.
3. The PLC is responsible for resetting command bits sent from the HMI to the PLC. If the commanded state cannot be achieved for any reason, the PLC resets the bit to allow the operator to set the command bit again. For example, when pressing the AUTO button on the HMI, the PLC resets the AUTO command from the HMI after the device is in the AUTO Mode. If the AUTO Mode is not available for any reason, the PLC resets the bit, so the AUTO button can be selected at the HMI once AUTO control is available.
4. Unless otherwise specified, when equipment is placed in LOCAL or HAND mode, control shall be transferred to local control devices and SCADA control outputs shall be disabled.

B. Interlocks:

1. Hardwired interlocks will interlock the controls locally, at the associated vendor provided Control Panels (PLC based and/or Relay logic based), at the respective Pump Control Panel PLC (PLC-PCP) and at the Influent Pumping System Control Panel PLC (PLC-IPS) where required. If the interlock occurs, the shutdown will cause the equipment to be inoperable at all levels of control.
2. Software interlocks are represented in a particular layer of the operation description and interlock the controls in that layer and the layers above it. However, the interlock does not interlock the commands in the layer before it. For example, a software

interlock implemented at the SCADA/PLC level will not stop equipment from being controlled locally.

3. Interlocks that shutdown (stop a piece of equipment and prevent it from being restarted or moved) are displayed on the faceplate pop-up graphic for that piece of equipment.
4. Vendor-supplied equipment protection relay logic based timers shall override software interlock timers programmed at PLC-PCP and PLC-IPS. Timing must be coordinated to prevent conflicts between software timers and PLC logic during equipment operation.

C. Motors / Motor Starters / Drives:

1. Provide monitoring and control of the signals shown on the P&IDs.
2. Hardwired and software interlocks are defined in individual loop descriptions.
3. Motors can be started manually by the operator at the Motor Starter, the HMI, or automatically by the control strategy.
4. Automatic control strategies are defined in individual loop descriptions.
5. If the motor is in OFF or LOCAL, SCADA start/stop controls shall be disabled.
6. If a motor stops for any reason, it cannot be restarted automatically once the problem with the motor has been resolved. A manual reset from the OWS or OIT is required to resume operation.
7. The LOCAL-OFF-AUTO (LOR) selector, shall indicate to the operator when the equipment operating in the LOCAL mode. When operating in LOCAL mode, equipment shall be controlled by the Motor Starter or Drive local controls. When operating in REMOTE, the SCADA PLC outputs shall control the equipment. The SCADA system stops a motor or drive, if one of its software interlocks trips.

D. Valves:

1. Provide monitoring and control of the signals shown on the P&IDs.
2. Hardwired and software interlocks are defined in individual loop descriptions.
3. Valves with only full travel capability can be opened or closed manually by the operator at the HMI, or automatically by the control strategy.
4. Modulating valves with position feedback can be positioned between 0% and 100% open manually by the operator at the HMI, or automatically by the control strategy.
5. Automatic control strategies are defined in individual loop descriptions with their corresponding process variable used for control.

E. Analog Instruments:

1. Analog instruments refer to indicating devices capable of providing a continuous output relative to time.
2. Provide monitoring of the analog signals shown on the P&IDs.
3. Analog signals may be a continuous voltage (-10V to 10V, 0V to 5V, 0V to 10V) or current (0 mA to 20mA, 4mA to 20mA) as determined by the output of the field instrument. The output range corresponds to the minimum and maximum full-scale measurement.
4. The PLC will linearly scale the output range (voltage or current) to the equivalent values in engineering units.
5. Provide cutoff deadbands for when the analog signal is approaching the minimum or maximum full-scale measurement.

    a. An analog signal measuring less than or equal to 2% of full-scale will be forced to zero after an adjustable time delay.

b. An analog signal measuring greater than 100% of full-scale will be clamped at 100%.

6. Provide a CALIBRATION mode with an adjustable time setpoint (in hours).

a. When entering CALIBRATION mode, the last good value is held prior to CALIBRATION mode being activated. The value is held until the calibration time setpoint expires.
b. The Operator may enter a calibration value, which will be the value held until the calibration time setpoint expires.
c. When active, clearly indicate the instrument is in CALIBRATION mode on any local OITs and in the HMI system.

F. Discrete Instruments:

1. Discrete instruments refer to indicating devices with any number of non-continuous defined states (e.g., ON/OFF, 0 or 1)
2. Provide monitoring of the discrete signals shown on the P&IDs.

a. When a contact or status from the instrument is true, the PLC will receive power to its input channel. The PLC registers this as a binary bit of 1.
b. When a contact or status from the instrument is false, the PLC will receive no power (open circuit) to its input channel. The PLC registers this as a binary bit of 0.

G. PLC Hardware:

1. Monitor status and communication faults at the HMI.

a. Implement watchdog timers to monitor CPU and I/O module health, and execution time for PLC routines.
b. Generate an alarm at the HMI if any watchdog timer expires.

2. Program the system time for PLCs to synchronize with a Network Time Protocol (NTP) server once every 24 hours.

H. Input Validation:

1. Provide input validation for setpoints used in process control (e.g., wet well level setpoints, pump flow setpoints).
2. The PLC will verify that the HMI setpoint is within an acceptable predefined range.
3. Out of range values will be rejected by the PLC and the current value will be retained.

3.3 HISTORICAL DATA COLLECTION

A. Provide historical data collection for analog inputs, process control setpoints, flow totals, equipment runtimes, and discrete equipment statuses (ON/OFF), unless otherwise stated in the individual loop descriptions. Historical data collection is as follows:

Collection Options	
Collection Type:	Polled
Collection Interval:	1 minute
Collection Offset:	0 seconds

Collection Options	
Time Resolution:	Milliseconds
Compression:	Enabled
Collector Deadband:	0.5 Percent Range
Collector Compression Timeout:	15 minutes

3.4 ACCUMULATORS AND TOTALIZERS

A. Accumulators:

1. Display accumulated run time for equipment with a RUNNING status. Each run time accumulation is resettable from the HMI with a reset push button.
2. The PLC will update the flow totals at 12:00 a.m. local time.

Runtime	Display Format
Current Day:	XX.XX Hrs.
Yesterday:	XX.XX Hrs.
Current Month:	XXX.X Hrs.
Previous Month:	XXX.X Hrs.
Accumulated Total:	XXXXXX Hrs.

B. Flow Totalizers:

1. Totalize flow indications.

   a. If the flowmeter provided has a configurable pulse output for totalized flow, perform flow totalization using the pulse output. The PLC calculates totalized flow by multiplying the number of pulses by the volume per pulse.
   b. If the flowmeter provided does not have a configurable pulse output for totalized flow, perform flow totalization using the analog 4-20mA signal.

      1) Do not totalize if the analog signal is outside the 4-20 mA range.
      2) Do not totalize if the value of the flow input is less than 2% of the full range of the input.
      3) Do not totalize if a discrete status exists that can be used to determine if flow is present (for example, no flow can be present unless a pump is running).

2. Each flow totalization is resettable from the HMI/OIT with a reset push button.
3. Display totalized flow in million gallons (MG), thousands of gallons (kGal), or Gallons (Gal) in accordance with the following:

Totalizer	MG Format	kGal Format	Gal Format
Current Day:	X.XXX	XXX.XX	XXXX.X
Yesterday:	X.XXX	XXX.XX	XXXX.X
Current Month:	XXX.X	XXX.X	XXXX
Previous Month:	XXX.X	XXX.X	XXXX
Accumulated Total:	XXXX	XXXX	XXXX

4. Use appropriate flow totalizer units for the total volume anticipated for the time period. Unless requested by the Owner, water process flows are totalized in million gallons (MG) and chemical flows are totalized in gallons (Gal). Auxiliary flow (e.g., backwash) units are determined based on the total flow for the day.

3.5 ALARMING AND EQUIPMENT FAILURES

A. Analog Alarms:

1. Provide analog alarming capability for analog signals monitored by the PLC.
2. Supervisor level users can set a common time setpoint (initially set to 5 seconds) that is used to generate alarms. The following alarms (setpoints to be Supervisor adjustable) are generated based on the analog feedback value. Each alarm includes the ability for individual enabling and disabling.

    a. High-High.
    b. High.
    c. Low.
    d. Low-Low.
    e. Loss of Signal.

3. LOSS OF SIGNAL alarm is generated when an analog signal goes outside the 4-20 mA range due to a failure at the instrument or PLC card. The following SCADA programming occurs:

    a. If the analog signal is used in a control loop or ratio control loop, that loop is placed into MANUAL.
    b. If the analog signal is used in a calculation, that calculation uses the last good analog signal. If the calculation is used in a control loop, that loop is placed into MANUAL.

4. SETPOINT REJECTED alarm is generated at the HMI when an analog setpoint is out of range and rejected by the PLC.

B. Discrete Alarms:

1. Program discrete alarm signals wired to the PLC (float switches, pressure switches, overload alarms) to alarm after an HMI adjustable time delay expires.
2. The maximum alarm delay for Safety related alarms (e.g., E-stop) is 500ms. Set each alarm timer during startup.

C. Motor Failure Alarms:

1. Supervisor level users can set a common elapsed time setpoint for each scenario below:

    a. Motors being remotely controlled generate a FAIL-TO-START alarm when the PLC sends the START command to the motor and it does not receive a RUNNING status from the motor after a supervisor adjustable time setpoint. When a FAIL-TO-START alarm is generated, the START output command from the PLC is deenergized and the motor is prevented from starting until a reset is issued from the HMI.

b. Motors being remotely controlled generate a FAIL-TO-STOP alarm when the PLC sends the STOP command to the motor and it continues to run after a supervisor adjustable time setpoint.
c. Motors with adjustable speed control generate a SPEED DEVIATION alarm when the motor is running and the PLC sends a speed setpoint to the motor and it does not reach the desired speed (within a deadband, initially set to 10%) within a supervisor adjustable time setpoint. The motor remains running if the SPEED DEVIATION alarm is activated.

D. Valve Failures:

1. Supervisor level users can set a common time setpoint for each type of valve that is used to generate the following alarms. When a valve position alarm is active, the PLC output is maintained unless explicitly stated in the individual loop descriptions (e.g., a fail to open alarm does not trigger the PLC to close the valve).

a. All discrete valves (OPEN-CLOSE) being remotely controlled generate a FAIL-TO-OPEN alarm when the PLC sends the OPEN command to the valve and it does not reach the OPENED limit within a supervisor adjustable time setpoint.
b. All discrete valves (OPEN-CLOSE) being remotely controlled generate a FAIL-TO-CLOSE alarm when the PLC sends the CLOSE command to the valve and it does not reach the CLOSED limit within a supervisor adjustable time setpoint.
c. All modulating valves (POSITIONING) being remotely controlled generate a FAIL-TO-POSITION alarm when the valve feedback does not match the PLC commanded position within a supervisor adjustable time setpoint.

3.6 AUTOMATIC CONTROLS

A. Lead/Lag and Standby Strategy:

1. Pump Priority:

a. When pumps are called to run by the automatic sequence, the order of their priority is determined by the following mode selection.

1) Operator Mode: The operator manually selects the priority of each pump (LEAD/LAG1/LAG2/LAG3/STANDBY/OFFLINE) using radio buttons on a popup display. The order can be changed at any time, but no two pumps can be selected to have the same priority. The pump cannot run in automatic mode or be used in any of the following automatic sequences if placed OFFLINE.
2) Sequential Mode: Used for groups of three or more pumps (e.g., LEAD/LAG1/LAG2/LAG3/STANDBY). The pumps are inserted into the sequence in ascending numerical order and the PLC rotates the pumps using a revolving queue. After an adjustable time setpoint expires, the LEAD pump becomes the STANDBY, the previous LAG1 pump becoming the new LEAD, the previous LAG2 becoming the new LAG1, and the previous LAG3 becoming the new LAG2.
3) Timed Mode: The pump priorities are determined by the runtime of the pump. The pump with the lowest runtime becomes the LEAD pump. The second lowest runtime becomes the LAG1 pump. This pattern continues until pumps are assigned a priority. The PLC determines the

pump priority when either pumps are stopped by the strategy, or when the pumps have been running for longer than an adjustable time setpoint.

2. Semi-Automatic Operation:

   a. If the individual loop description requires that the pumps operate in the LEAD/LAG1/LAG2/LAG3/STANDBY mode, the Plant Operator shall manually start the required LAG pump after a prominent indication (pop up) on the OITs (OIT-IPS) and SCADA, and when the following conditions are met after a time delay. If more than one LAG pump is included in the strategy (LEAD/LAG1/LAG2/LAG3/STANDBY), the sequence repeats.

      1) The LEAD pump is running at maximum speed for an adjustable length of time.
      2) The process variable being controlled is more than 5% from the target value. For example, in level control, the level must be 5% above the target.

   b. If multiple pumps are called to run by the automatic logic, the pumps will control the respective drive to run at the same speed.
   c. If the automatic strategy determines that a pump is needed and the pump for the required sequence position is unavailable, the pump with the next highest position is prompted to be manually started.

B. PID Control:

1. When individual control loops require PID control, use the PLC manufacturer's standard PID control functions. Provide a PID faceplate with the following parameters:

   a. Setpoint (SP): Reference to the setpoint. This is the setpoint entered (either manually from the HMI or via program logic, as required by the individual loop description) and is maintained by the PID controller.
   b. Process Variable (PV): Reference to the process variable. The process variable is the feedback from a field device or instrument for comparison to the SP by the PID controller.
   c. Output (CV): Reference to the controlled variable. This is the signal varied by the PID controller in order to maintain the PV at the desired SP.

2. PID controller accepts inputs for proportional (P), integral (I), and derivative (D) setpoints used to tune the controller response. PID tuning parameters can be entered manually by the Operator at the HMI or calculated automatically if the PID controller supports autotuning functionality.
3. Operator can place the PID controller in MANUAL or AUTOMATIC mode.

   a. In MANUAL, the Operator will enter the desired output (CV). The PID controller will use setpoint tracking to write the process variable (PV) to the controller setpoint (SP) to ensure bumpless transfer when the controller is switched from MANUAL to AUTO.
   b. In AUTO, the PID controller adjusts the output (CV) to hold the process variable (PV) at the setpoint (SP).

4. Configure PID controller to prevent reset windup when operating in MANUAL mode or when the output (CV) has reached maximum limit.

C. Cascade Level Control for Variable Speed Pumps

1. Cascade level control requires two PID controllers used in series to manipulate one process variable (PV).
2. The primary/outer PID is a level controller, where the setpoint (SP) to the PID controller is in engineering units (feet, inches) and adjustable from the HMI. The output (CV) of the level PID controller is a flow, which becomes the remote flow setpoint (SP) to the secondary/inner PID.
3. The secondary/inner PID is a flow controller, where the flow setpoint (SP) is the output (CV) calculated from the level PID controller. The output (CV) of the flow PID controller is a pump speed (%).

3.7 INDIVIDUAL CONTROL DESCRIPTIONS AND CONTROL SEQUENCES

LOOP No. LOOP DESCRIPTION PAGE No.
LOOP 0020-X - WET WELLS LEVEL 10

LOOP MS-0050-1X - ELECTRICAL EQUIPMENT MONITORING 26
LOOP UA-0080 – VENTILATION EQUIPMENT MONITORING 27
END OF SECTION 406196 27

The character "X" is a variable that represents the multiple loops across the same type of equipment. E.g. Loop SV-0050-X contains control descriptions common for Loops SV-0050-1, SV-0050-2, SV-0050-3, SV-0050-4, SV-0050-5 and SV-0050-6

LOOP 0020-X - WET WELLS LEVEL

A. General:

1. Continuous monitoring of screened raw wastewater level by means of redundant radar level transmitters backed up with a pair of existing ultrasonic level transducers. Each wet well is provided with a radar and an existing ultrasonic transmitter. The level of the wet well(s) shall be used to control Influent Pumps No. 1-6 (Loops P-0050-1 through 6). See LOOP LC-0050-X - WET WELL LEVEL CONTROL below.
2. Under normal operating conditions both wet wells are connected and experience equal hydraulic conditions. This situation shall be monitored not only by comparing measurements from the level instruments, but also from the status of the actuator limit switches (open position) provided in the interconnecting gate actuators GV-0071-1 and GV-0072-1.

3. The level transmitters shall be ranged on the field to measure level from EL. -36.50 to EL. -11.50.

B. Control:

1. PLC-IPS:

a. Software selector switches at OIT-IPS and SCADA shall give the operator the ability to choose the primary level measurement device for automatic level control. Under normal operating conditions, the radar level transducers shall be used for control of the pumps. The operator shall have the ability to choose radar 1, radar 2, or average of both radar readings. For backup operation, the operator shall have the ability to choose ultrasonic 1, ultrasonic 2 or the average of both ultrasonic readings.
b. Regardless of the instrument chosen for the level control logic, there shall be an operator adjustable deviation programmed between the radars and ultrasonic instruments to indicate a “high deviation”.
c. There shall be no automatic failover of a level reading to the alternate level reading, only alarms with system holding last good value. Operator intervention is required to use the backup level transducers.
d. Under certain circumstances one wet well may be out of service. In that case, the operator shall select which wet well remains in-service via software controls on the HMI. Readings from the level instruments associated with the out-of-service wet well shall not be used for level control.
e. The PLC shall stop the running pump(s) when a user adjustable Low Level set point initially set to EL-21.65 is measured by the active level measurement transducer(s).
f. Signals from the pressure switches installed upstream of the isolation gates (GV-0071-1 and GV-0071-2), shall be used to initiate a Pump Stopping Sequence as described in LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCES, below.

C. Alarms:

1. SCADA, OIT-IPS, OIT-PCP-1 through OIT-PCP-6:

a. Radar level indications (LI-0020-1, -2)
b. Radar levels average (LI-0020-3)
c. High radar level alarm (LAH-0020-1)
d. Ultrasonic level indication (LI-0011-1, -2)
e. Ultrasonic levels average (LI-0011-3)
f. High ultrasonic level alarm (LAH-0011-1)
g. Low-Low level alarm (LAL, Field determine. Initially set to EL -20.65)
h. High-High level alarm (LAH EL, Field determine. Initially set to -16.05)
i. Emergency level alarm (LAHH, Field determine. Initially set to EL -15.55)
j. Radar level deviation alarm (DLA-0020-3)
k. Ultrasonic level deviation alarm (DLA-0011-3)
l. Radar/Ultrasonic level deviation alarm (DLA-0020-2)

LOOP FSL-0050-X - SEAL WATER FLOW

A. General: There is a thermal dispersion seal water flow switch that confirms seal water flow for the respective pump. Seal water system low flow signal is wired to the Motor Starter and relayed to the respective PLC-PCP immediately after detection.

© 2026 CDM Smith
All Rights Reserved

B. Control:

1. PLC-PCP-X

a. PLC-PCP shall confirm seal water flow as a permissive for operation of the pump.
b. Failure Scenarios:

1) During a pump start sequence, a loss of seal water flow shall initiate a timer initially set to 5 seconds. If the timer expires before the loss of flow condition is cleared, the starting sequence shall be aborted and the associated Cone Valve commanded to close.
2) During ongoing pump operation, once the low flow signal is received and the ECD clutch is disengaged (impeller is in motion), the PLC shall start a timer initially set to 5 seconds. Once the timer expires, and the signal remains active, the PLC shall initiate a stopping sequence.

2. PLC-IPS

a. Monitors the seal water system operation for the complete influent pumping system.

C. Alarms / Monitoring:

1. SCADA, OIT-IPS, OIT-PCP-1 through OIT-PCP-6:

a. Low flow (FAL)
b. Low flow condition shall initiate a pump stopping sequence and provide a prominent pop-up notification to Operators (on the OITs and SCADA), informing Operators of the initiation of a pump stopping sequence to safeguard the integrity of the pump.

2. Historical Data Collection:

a. Provide historical data collection as described in "Historical Data Collection" Article of this section.
b. Provide the motor control, monitoring, runtime accumulation, and failure alarming. as described in "General Controls and Monitoring", "Accumulators and Totalizers,' and "Alarming and Equipment Failures" Articles specified in this section.

LOOP SV-0050-X - SEAL WATER SOLENOID VALVE

A. General: There is a seal water solenoid actuated valve that opens to provide seal water to the respective pump.

B. Control: via hardwired relay logic contained in the associated pump Motor Starter.

1. Commands the solenoid valve to open and provide seal water to the pump.
2. Part of pump starting sequence (see LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCES, below)

C. Alarms / Monitoring:

1. Provide the motor control, monitoring, runtime accumulation, and failure alarming, as described in “General Controls and Monitoring”, “Accumulators and Totalizers,” and “Alarming and Equipment Failures” Articles of this section.
2. Provide historical data collection as described in “Historical Data Collection” Article of this section.

LOOPS GV-0050-X, KGV-0050-X – PUMP TRAIN ISOLATION VALVES

A. General: Valves provided with OPEN/STOP/CLOSE (O/S/C) and LOCAL/REMOTE (L/R) hand switches at the respective actuator. The actuator’s L/R selector switch shall be left in “Remote” during normal operation. These actuator pairs shall also be provided with accessible controls and indicating lights mounted on the respective Pump Control Panel, providing functionality regardless of the health of the PLC inside of the PCP. Under normal operating conditions, the L/R selector switch at both the actuator and on the PCP shall also be placed in the “Remote” position.

B. Control:

1. Local (at Actuator):

   a. Remote/Local Switch
   b. Open/Close Switch

2. Remote, at the respective PLC-PCP-X Control Panel, on the ground level:

   a. Remote/Local Switch
   b. Open/Close switch

3. PLC-PCPs:

   a. When the selector switches for the isolation gate valves in a pumping train are set to "Remote" on both the actuator and its corresponding PCP hand controls, the PLC-PCP controls and monitors these actuators.
   b. When the selector switches at both the actuator and its associated LCS, are in “Remote”, the actuator is controlled by the respective PLC-PCP-X. The respective PLC-PCP-X will monitor the open and close limit switch signals regardless of the position of the L/R selector switches.
   c. When the pump control is in automatic mode and control of pumps is either manual or automatic from the SCADA system, the pumps shall not start unless it’s corresponding isolation gates are opened as confirmed by the respective limit switches. This permissive shall not be in place when pumps are manually operating locally from the equipment.
   d. Part of pump starting sequence (see LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCES, below).
   e. The isolation valves shall be commanded to close upon failure of the associated Cone Valve. I such case, a modified pump stopping sequence similar to what is described in LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCES, below is to be initiated. In this situation, instead of modulating the cone valve to close, the isolation discharge knife gate shall be commanded to close. As the KGV closes the Eddy Current drive shall modulate its speed to match the pressure on its header with the one measured at the common discharge header. Once the Gate is confirmed Closed the suction gate valve shall be commanded to close.

4. PLC-IPS

    a. PLC-IPS shall monitor the open and close limit switch signals of actuators regardless of the position of the L/R selector switches.

C. Alarms/Monitoring:

1. Remote
2. Overload
3. Opened
4. Closed
5. Data Collection: Provide historical data collection as described in “Historical Data Collection” Article of this section.

LOOP CV-0050-X - CONE VALVES

A. General: Cone valves are used to prevent backflow of wastewater from downstream processes during pump starting and stopping sequences.

B. Control:

1. PLC-PCP-X. Part of pump starting sequence (see LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCES, below)
2. Local Control Panel (By Vendor):

    a. The user interface provides three means of operation (at Cone Valve Control Panel):
    b. Setup: Calibration mode. Used for maintenance and troubleshooting.
    c. Auto: Remote mode. Standard mode of operation. Used for automatic pump starting and stopping sequences.
    d. Manual: Local Mode. Overrides Auto mode and provides operators with local control of the cone valve.

C. Alarms/Monitoring:

1. Remote
2. Malfunction
3. Opened
4. Closed (both from vendor controller, and auxiliary limit switch)
5. Trip
6. Warning
7. Position
8. Failed to Close (with a prompt to Operator to Close the associated Pump Isolation Valves)

D. Data Collection: Provide historical data collection as described in “Historical Data Collection” article of this section.

E. Failure scenarios:

1. Cone valve failure shall initiate a modified pump stopping sequence similar to what is described in LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCES, below. In this situation, the modified stopping sequence instead of modulating the cone valve to close, shall command the isolation discharge knife gate

to close. As the KGV closes the Eddy Current drive shall modulate its speed to match the pressure on its header with the one measured at the common discharge header. Once the Gate is confirmed Closed the suction gate valve shall be commanded to close.

LOOP PDS-0050-X – CONE VALVE DIFFERENTIAL PRESSURE SWITCH

A. General: The differential pressure switch measures pressure between the upstream and downstream piping connected to the associated cone valve. Once equal pressure conditions are met (differential pressure contact is energized), the cone valve is permitted to open during a pump start sequence.

B. Control:

1. PLC-PCP-X. Part of pump starting sequence (see LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCESE, below).
2. Differential Pressure Setpoint used for pump startup sequence: The pressure measured at the Cone Valve inlet side (high pressure leg) shall be equal to the pressure measured on the outlet side (low pressure leg) of the Cone Valve, **PLUS** a field determined offset value (calibrated in the field device, and initially set to 11.5ftH_2O ~ 5psi).

C. Alarms/Monitoring:

1. Differential Pressure (PD)

LOOP PIT-0050-X – PUMP DISCHARGE HEADER PRESSURE TRANSMITTERS

A. General:

1. Pressure transmitters mounted on the pumps discharge header between the Pump and the Cone Valve, continuously monitor pressure and used during the automatic Stopping Sequence.

B. Control:

1. SCADA, OIT-IPS, OIT-PCP-1 through OIT-PCP-6:

a. Part of pump stopping sequence (see LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCESE, below)

C. Alarms/Monitoring:

1. Pressure PAH
2. Out of range

LOOP PIT-0060-X – COMMON HEADER PRESSURE TRANSMITTERS

A. General:

1. Pressure transmitters mounted on the pumps discharge common header continuously monitor pressure at the East and West force mains.

B. Control:

1. SCADA, OIT-IPS, OIT-PCP-1 through OIT-PCP-6:

a. Part of pump starting sequence (see LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCESE, below)
b. Software selector switches at OIT-IPS and SCADA shall give the operator the ability to choose the primary pressure measurement device for pump starting sequence control. The operator shall have the ability to choose PT-0060-1, or PT-0060-2, or average of both pressure readings.
c. Regardless of the instrument chosen for pump starting sequence logic, there shall be an operator adjustable deviation programmed between the pressure transmitters to indicate a “high deviation”.
d. There shall be no automatic failover of a pressure reading to the alternate pressure transmitter, only alarms with system holding last good value.

C. Alarms/Monitoring:

1. Pressure PAH
2. Out of range

LOOP P-0050-X – INFLUENT PUMPS NO. 1 TO NO.6

A. General: The dry well's vertical shaft influent pumps, equipped with variable speed (Eddy current) drives, transfer screened sewage water from both East and West wet wells to a common discharge header, which then feeds the respective forced mains. Each wet well is provided with three pumps: Pumps No.1 through No.3 serving the East Wet Well, and pumps No. 4 through No.6 serving the West Wet Well. The pumps shall have the ability to operate locally from the respective Pump Control Panel (PLC-PCP-1 through PLC-PCP-6), or remotely from the HMI. When controlled from the HMI, the Operator shall have the ability to control the pumps either manually or in an automatic level control mode. In Manual mode, the operator shall have the option to start, stop, and change the speed of the controlled pump. In Automatic mode, the operator shall be able to configure lead/lag designation and enable automatic wet well level control. Pump speed modulation shall be automatic; however, pump start and stop sequences shall remain operator-initiated as described in LOOP LC-0050-X.

B. The Vibration and bearing Temperature Monitoring System (VTMS) shall communicate additional pump information to the PLC-IPS using data communications protocol over Category cabling. This information shall not be used for software control interlocks and only be used for alarm and monitoring purposes. High vibration and/or high bearing temperature conditions shall be alarmed and recorded in the plant SCADA historian accordingly.

C. Automatic Wet well level control shall be based on the operator selection for primary control variable as described in LOOP LC-0050-X - WET WELL LEVEL.

D. Control:

1. Hardwired Interlocks (PLC-PCP-1 through PLC-PCP-6): Critical pump and motor fault signals shall be wired to the respective Pump Control Panel PLC to initiate a stop sequence or prevent the initiation of a start sequence of the respective pump.

a. Critical pump and motor fault signals include:

1) Emergency stop pushbuttons
2) Motor High Winding Temperature.
3) Eddy current drive malfunction
4) Cone valve malfunction
5) Cone valve limit switch closed (ZSC-0050-1 through 6).
6) Seal water no flow.

2. Software Interlocks:

a. When the wet wells are hydraulically connected, the SCADA system stops the running pump(s) when a user configurable low level (initially set EL -21.65) is measured by the active level instrumentation.
b. When one of the wet wells is out-of-service, as selected by Operator:

1) Operators shall be provided with means to select which wet-well is out-of-service as required.

a) The pumps associated with the out-of-service wet well shall be forbidden from running in automatic mode. Manual operation shall be retained to assist during tank drainage procedures if acceptable by the Operator.
b) The pumps associated with the remaining (in-service) wet well shall be permitted to automatically control level in either LEAD/LAG1/LAG2 or LEAD/LAG1/STAND-BY configuration as selected by the operator, Or to manually control the pumps.

2) Pumps in the in-service wet well shall stop when low level (LOOP 0020-X - WET WELLS LEVEL) is measured by the selected level transducers.
3) Software interlocks shall be disabled when the L/O/R selector switch at the associated equipment is in the "Local" position. Software interlocks remain active in Remote mode regardless of Auto/Manual selection.
4) A pump shall not be permitted to start unless its corresponding isolation knife gates are opened. A message shall pop-up to alert the operator to open these valves prior to starting pump. However, the Operator shall be provided with password-protected override capability to allow manual initiation of a pump start sequence.

3. Medium Voltage Motor Starter:

a. Local: When the L/O/R switch is in the "Local" position, the Motor Starter is started/stopped through local pushbuttons on the Motor Starter Cabinet.
b. Remote: When the L/O/R switch is in the "Remote" position, the Motor Starter is Start and Stop controls are transferred to the RESPECTIVE PLC-PCP-X . In this mode, the respective PLC-PCP logic monitors the operation of the Motor Starter and provides control.
c. Off: When the L/O/R switch is in the "Off" position, the start/stop features both at the Motor Starter cabinet and at remote locations (OITs, SCADA) shall be disabled.
d. Alarming and historical data recording functionality shall be provided at the SCADA level regardless of the position of the L/O/R selector switch on the Motor Starter cabinet.
e. The Motor Starter is provided with internal hardwired relay logic overriding PLC-based control functionality.

4. Eddy Current Drive Control Panel:

    a. Local: When the L/O/R switch is in the "Local" position, the eddy current drive is started/stopped through local pushbuttons on the eddy current drive control panel. The speed of the eddy current drive shall be adjustable locally on the eddy current drive control panel.
    b. Remote: When the L/O/R switch is in the "Remote" position, speed control of the drive is transferred to the RESPECTIVE PLC-PCP-X .
    c. Off: When the L/O/R switch is in the "Off" position, the start/stop features at the eddy current drive control panel and remote operation will be turned off.

E. Alarms/Monitoring:

1. The following signals are to be transmitted to the SCADA PLC over Ethernet connection and are typical for each Vibration and Temperature Monitoring Panel (VTMP) as shown on the drawings:

    a. Motor Winding 1 Temperature
    b. Motor Winding 2 Temperature
    c. Motor Winding 3 Temperature
    d. Motor Winding 4 Temperature
    e. Motor Winding 5 Temperature
    f. Motor Winding 6 Temperature
    g. Motor Bearing 1 Temperature
    h. Motor Bearing 2 Temperature
    i. Motor High Temperature
    j. Top of Motor Vibration (X – Axis)
    k. Top of Motor Vibration (Y – Axis)
    l. Top of Motor Vibration (Z – Axis)
    m. Base of Motor Vibration (X – Axis)
    n. Base of Motor Vibration (Y – Axis)
    o. Motor High Vibration

2. Pumps shall indicate starts per hour on OIT-IPS, OIT-PCP and SCADA. The motors and pumps run the risk of overheating and present premature failure if they start more than a user configurable (password-protected) number of times per hour, initially set this parameter to once per hour. An alarm shall be announced at 2 or more starts per hour.

F. Data Collection: Provide historical data collection as described in “Historical Data Collection” Article of this section.

LOOP PC-0050-X - PUMP CONTROL – START AND STOP SEQUENCES

A. General:

1. This loop defines complete pump start, and pump stop sequencing logic, including the use of differential pressure switches (DPS-0050-X) pressure transmitters (PIT-0050-X, PIT-0060-X), operator pressure-source selection, deviation handling, fallback timer behavior, Eddy drive speed control, and cone-valve opening.
2. Differential pressure switches (DPS-0050-X) and discharge header pressure transmitters (PIT-0050-X) serve distinct functions in the pump control sequences. DPS devices are used exclusively during pump starting sequences to verify acceptable pressure differential conditions across the cone valve prior to opening. PIT

devices are used during pump stopping sequences to monitor and control discharge pressure for coordinated pump speed reduction and cone valve closure.

3. The PLC shall determine when a pump start or stop sequence is required and identify the applicable pump based on the configured LEAD/LAG/STANDBY sequence. The Operator shall be prompted to initiate either a Pump Starting Sequence or a Pump Stopping Sequence.

B. PLC-IPS logic:

1. If the separation gate valve (GV-0054-1) is fully closed as confirmed by its closed limit switch signal, Operators shall be prompted to acknowledge that PIT-0060-1 will be used in the logic for Pumps 1 through 3 and PIT-0060-2 in the logic for Pumps 4 through 6.

C. PLC-PCP-X logic:

1. Operators shall either manually designate one of the two headers' pressure transmitter signals (PIT-0060-1 or PIT-0060-2) or opt to use the averaged values from both instruments provided the separation gate valve (GV-0054-1) is fully open as confirmed by its opened limit switch signal. The selected signal shall be used by the respective PLC-PCP-X as a reference against the respective Pump Discharge Pressure transmitter (PIT-0050-X) in the Pump Starting and Stopping sequences described below.
2. Logic shall confirm a clear path of flow through the Main Discharge header connections by confirming open status from the Associated Knife Gate Valves installed on the 48in common discharge headers (GV-0054-1, GV-0055-1, GV-0055-2, and GV-0055-3)
3. Automatic Pump Start Sequence logic:

    a. Once the pump start sequence is initiated, the following sequence shall happen:

        1) Logic shall confirm that the Pump Train Isolation Valves (LOOPS GV-0050-X, KGV-0050-X – PUMP TRAIN ISOLATION VALVES, above), are fully open. If either valve is not confirmed 100% open by the respective open limit switch, the Operator shall be prompted to field verify the position of the valve(s) before continuing with the Pump Starting Sequence. If Operator does not confirm continuation of the Pump Starting Sequence within one minute, the Pump Start Sequence logic shall not continue.
        2) The seal water system solenoid is commanded to open (via relay logic contained in the Low Voltage Motor Starter), to permit seal water to enter the pump.
        3) Seal water flow signal shall be confirmed using the associated seal water flow switch before continuation of the Starting sequence. If the seal water low flow signal is not cleared, the Starting sequence shall be aborted and the seal water solenoid commanded to close.
        4) A timer (determined during startup) shall be provided for the motor to reach full speed. Once both the timer expires, and the seal water flow conditions are satisfied, the respective PLC-PCP shall command the Eddy current drive clutch to engage, effectively initiating motion of the pump impeller.
        5) Once the Eddy Current Drive clutch is engaged:

            a) The speed of the pump shall be commanded to speed up gradually and until the Differential Pressure Switch setpoint is met (see

LOOP PDS-0050-X – CONE VALVE DIFFERENTIAL PRESSURE SWITCH, above). Once the Differential Pressure condition is satisfied, the Cone Valve shall be commanded to open.

b) If there is any other pump already running (as referenced via communications from PLC-IPS), the drive shall modulate the pump speed to match the speed of the running pump(s), and then gradually speed up until the Differential Pressure Switch setpoint is met (see LOOP PDS-0050-X – CONE VALVE DIFFERENTIAL PRESSURE SWITCH, above).

c) Integrator shall coordinate software based timers with the relay timers provided in the Motor Starter. Motor Starter relay timers shall be considered as last mean of protection. Coordination shall ensure that there are no timing conflicts between the two.

4. Automatic Pump Stop Sequence logic:

   a. Once the pump stop sequence is initiated, the following sequence shall happen:

      1) The cone valve shall be commanded to close.
      2) When the Cone Valve begins its closing operation, a temporary increase in its upstream pressure is anticipated. As the Cone Valve closing motion continues, the PLC-IPS PLC shall command the Eddy Current Drive to modulate the speed of the pump to match the pressure measured the on the pump discharge header (LOOP PIT-0050-X – PUMP DISCHARGE HEADER PRESSURE TRANSMITTERS, above), with the pressure measured on the common discharge header (LOOP PIT-0060-X – COMMON HEADER PRESSURE TRANSMITTERS, above).
      3) Once the Cone valve is confirmed fully closed, the PLC-PCP shall command the Eddy current drive to disengage the clutch.

         a) Relay logic in the Low Voltage Motor Starter commands the motor to stop once the Cone Valve is confirmed closed.
         b) Timer-based relay logic in the Low Voltage Motor Starter commands the seal water system solenoid valve to close once the impeller is fully stopped.

5. Emergency Stopping procedure:

   a. Once an E-Stop is activated, the associated pump shall be commanded to immediately initiate a Pump Stopping Sequence.
   b. An E-Stop active signal shall prevent initiation of a pump starting sequence until the situation is resolved and the field distributed E-Stop pushbuttons are reset.

6. Each PLC-PCP-X shall be configured to accept pump starting and stopping sequence commands from PLC-IPS, when their associated main selector switch is in REMOTE. Once a PLC-PCP-X receives the start sequence command, the PCP shall run at the speed determined by PLC-IPS.
7. Failure Scenarios:

   a. If the reference pressure signal (see 1, above) is not available, or if PLC-IPS is unavailable or fails, and the respective PLC-PCP-X cannot determine the Operator selected reference pressure, or determine if another pump is already

running, or it cannot determine the speed of the running pump(s), an alarm shall be announced at the respective PLC-PCP-X. Under these conditions, the Pump Starting Sequence shall be inhibited when the automatic Wetwell Level Control is active (see LOOP LC-0050-X - WET WELL LEVEL CONTROL, below). Nevertheless, the Operator shall retain manual control of the pump and be able to initiate a starting sequence from the respective PLC-PCP-X if so required.

b. During startup, a user configurable timer initially set to 30 seconds shall be started. If the timer expires, and the associated Cone Valve has not become unseated from the closed limit switch as confirmed by both the analog signal from the Cone Valve Control Panel and from the limit switch signal relayed from the Motor Starter, then a Cone Valve failure is alarmed. At this moment, the pump shall be called to shut down immediately.

c. If the pump is started successfully and the Cone Valve becomes unseated from the closed position for a configurable timer initially set to four minutes, but does not reach the open limit switch or its analog signal does not reach a user configurable setpoint initially set to 95% opened, within a configurable timer initially set to 18 minutes, then a "Jam Alarm" shall be generated and the pump shall remain running. In this event, the operator shall determine whether to keep the pump running or to stop it.

d. Failure of any selected Lag pump, when a pump is selected as part of the Lead/Lag sequence and a failure condition occurs, operation shall continue automatic level control operation with the available and already selected pumps. Operator shall be notified that the affected lag pump will not participate in the sequence and shall be prompted to select a different Lag pump for operation. If no additional lag pump is available, Operators shall be notified that automatic level control will be stopped, and that the running pump(s) speed will be maintained at the current speed.

e. If a pump starting sequence is interrupted by operator by either switching any component to their manual position or by aborting the procedure altogether (E.g. LOOP FSL-0050-X - SEAL WATER FLOW operator initiated abort, above), the Cone Valve shall be commanded to close. If the Cone valve is the device that was switched from remote to hand by operator, the isolation valves shall be called to close and the pump be called to stop once either Closed limit switch is made.

LOOP LC-0050-X - WET WELL LEVEL CONTROL

A. General:

1. Continuous monitoring of screened raw wastewater level by means of level transmitters.
2. Under normal operating conditions both wet wells are connected and experience equal hydraulic conditions. This situation shall be monitored not only by comparing measurements from the level instrumentation, but also from the status of the actuator limit switches (open position) provided in the interconnecting gate valves GV-0071-1 and GV-0072-1. The automatic wetwell level control descriptions outlined herein shall be enabled only when these conditions are satisfied.
3. Low level conditions shall be monitored by Pressure Switches installed on the 48-inch pipes interconnecting the two wetwells as shown. The switches setpoint shall be field determined and calibrated so that the elevation in the active wetwell(s) does not fall below the elevation of the pump volute. The switches shall be hardwired to the Motor Starter, where relay logic will either prevent a pump from starting, or automatically stop the motor. Additionally, the low level signal transmitted from the

Motor Starter to the PLC-PCP shall initiate the appropriate Pump Stopping Sequence or prevent a Pump Starting Sequence from being initiated.

4. The PLC Logic shall be used to automatically control pumps speed, while operators retain manual control of initiating pump start and stop sequences.
5. Operators shall be provided with an option to disable Automatic wetwell level control, such an impending significant weather event, deems it risky and where manual control is preferred.
6. Hardwired protection devices shall act as the final safety interlock. PLC-based control shall provide normal process shutdown prior to activation of hardwired protection.

B. Control:

1. Automatic wet well level control shall be defined as a semi-automatic control mode consisting of the following:

   a. Pump Speed Control (Automatic): When one or more pumps are running in AUTO mode with the associated equipment in REMOTE, the PLC shall automatically modulate the speed of all running pumps in unison to maintain the wet well level within the active control band. Pump speed shall increase or decrease proportionally to the wet well level as described herein.
   b. Pump Start (Operator Initiated): When the control logic determines that an additional pump is required to maintain wet well level (based on level bands, p
   c. ump speed, or other configured criteria), the PLC shall not automatically start the next pump. Instead, the PLC shall:

      1) Generate a prominent operator prompt at the OIT-IPS and SCADA HMI indicating that an additional pump is required.
      2) Identify the next pump in the LEAD/LAG/ STANDBY sequence.
      3) Await operator confirmation.

2. The operator shall initiate the pump starting sequence. Upon operator confirmation, the PLC shall execute the full pump starting sequence as defined in LOOP PC-0050-X.

   a. Pump Stop (Operator Initiated): When the control logic determines that a pump should be removed from service (based on decreasing wet well level, minimum speed conditions, or level band thresholds), the PLC shall not automatically stop the pump. Instead, the PLC shall:

      1) Generate a prominent operator prompt at the OIT-IPS and SCADA HMI indicating that a pump stop is required.
      2) Identify the pump to be stopped based on the LEAD/LAG/ STANDBY sequence.
      3) Await operator confirmation.

3. The operator shall initiate the pump stopping sequence. Upon operator confirmation, the PLC shall execute the full pump stopping sequence as defined in LOOP PC-0050-X.

   a. Operator Responsibility: The operator is responsible for initiating all pump start and stop sequences during Automatic Wet Well Level Control mode. Failure to respond to prompts may result in wet well levels exceeding normal operating limits.
   b. System Operation Without Operator Response: If the operator does not respond to pump start prompts within a configurable time period, the system

shall alarm and notify the operator of potential overflow or system capacity exceedance conditions, as described in Failure

c. Scenarios below. The PLC shall not automatically start or stop pumps unless explicitly defined elsewhere for emergency conditions.

d. Definition of Automatic Mode: For the purposes of this specification, "Automatic Wet Well Level Control" refers to automatic modulation of pump speeds only. Pump start and stop actions remain operator initiated.

4. Control Logic PLC-IPS:

a. General: When the L/O/R switch at the respective Pump Control Panel (PLC-PCP-1 through 6) is in “REMOTE”, control is transferred to the PLC-IPS for Auto/Manual (A/M) control as described below.

b. Manual: When the L/O/R switch is in “Remote” (at the respective PLC-PCP-X), and the pump software A/M soft selector switch is in “Manual” (at PLC-IPS), the operator shall be able to initiate starting and stopping sequences as well as adjust the speed of the pump(s) through the OIT-IPS and SCADA.

c. Auto: When the L/O/R switch is in “Remote” (at the respective PLC-PCP-X), and the pump software A/M switch is in “Auto”, the pump's operation is based upon the LEAD/LAG1/LAG2/LAG3/STANDBY1/STANDBY2 designation of each pump.

1) Operator shall receive a pop-up message with alarm if any of the pumps chosen for LEAD/LAG1/LAG2/LAG3/STANDBY1/STANDBY2 are not operating in “REMOTE” at the respective PLC-PCP-X.
2) Operator shall receive a pop-up message with alarm if any of the pumps chosen for LEAD/LAG1/LAG2/LAG3/STANDBY1/STANDBY2 is not operating in “AUTO” at the PLC-IPS, that will require Operator action (set pumps in AUTO mode at OIT-IPS or SCADA, before pumps are initiated in the sequence.

d. Pump speeds shall ramp up and down in unison from min. to max. speed, at a speed that is proportional to the wet well level band where the pumps are operating within, unless noted otherwise.

1) As wet well level rises within an active control band, running pump(s) speeds shall increase proportionally.
2) As wet well level falls within an active control band, running pump(s) speeds shall decrease proportionally.

e. Pump speeds shall be limited to prevent the rated motor horsepower from being exceeded under all operating combinations, including one, two, and three-pump operation with either one or two force mains in service.

1) Operator-adjustable setpoints shall be provided to input the max pump speed in each of those six operating scenarios.
2) When required, a lag pump shall be started to reduce the load on the operating pump(s) and maintain individual motor horsepower at or below the motor nameplate rating. Speed limiting parameters shall be calibrated during startup to match flow, speed, and pressure conditions in the field. An additional operator-adjustable warning setpoint shall be provided to establish the maximum allowable pump flow for each operating scenario.

f. During initial configuration of the automatic level control system, Operators shall be able to select one of two password-protected global control options (affecting all pumps). These options shall determine the pump start and stop methodology used by the control system, as described in the associated control procedures specified herein.

g. Pump start procedures: Operators shall always be prompted to initiate a Pump Starting Sequence manually (Operator Prompted Pump Start, requiring the operator intervention and overseeing), as required to maintain level. Starting procedure shall follow the selected global option (see article f):

1) Option 1, Pump Start based on Pump Speed: The pumps shall be started in sequence as they reach maximum speed for a minimum of 60 seconds (operator adjustable), and level in the wetwells continues to rise. At which point, the Operator shall be prompted to start the next Lag pump.
2) Option 2, Pump Start based on Level Bands: The pumps shall be started in sequence as they reach the respective Pump Start level setpoint (operator adjustable) for a minimum of 60 seconds (operator adjustable). At which point, the Operator shall be prompted to start the next Lag pump. See Attachment 1 - Cedar Creek Influent Pumping System Wet Well Level Setpoints at the end of this section.

h. Pump shutdown procedures: Operators shall be prompted to initiate a Pump Stopping Sequence manually (Operator Prompted Pump Stop, requiring the operator intervention and overseeing), as required to maintain level. Stopping procedure shall follow the selected global option (see article f):

1) Option 1, Pump Stop based on Pump Speed: As level in the wetwells decreases, the running pumps will eventually reach a minimum speed at which point, a pump shall be called to stop based on the selected Lead/Lag and Standby Strategy and after the expiration of a user adjustable timer initially set to 60 seconds.
2) Option 2, Pump Stop based on Level Bands: When level in the wetwell reaches a user adjustable minimum pumping wetwell level setpoint (initially set to EL-21.65), a pump shall be called to stop based on the selected Lead/Lag and Standby Strategy and after the expiration of a user adjustable timer initially set to 60 seconds.

i. Pump speed control shall normally be based on wet well level. However, when the operator-adjustable maximum flow setpoint to the plant is reached (initially set to a default of 115 MGD, adjustable from 80MGD up to 150 MGD via OIT-IPS or SCADA), the Operator shall be prompted to acknowledge that the Pumping System operation will be clamped to this maximum flow setpoint. A clear and prominent indication on the HMI shall inform Operators when the pumping system is operating at the clamped flow value. Additionally, Operators shall be provided with a flow measurement selection prompt, where the Operator selects between using the reading of either flowmeter (FIT-0065-1 or FIT-0065-2), or the sum of readings from both flowmeters (FIT-0065-1 and FIT-0065-2), depending on actual valving conditions on the field.

1) In this mode, pump speeds shall be temporarily modulated to prevent flows from surpassing the flow setpoint of the clamp, and until:

a) The operator decides to switch back to Level Control mode (overriding the clamp), or

b) Wet well levels drop such that pumps begin shutting off based on level setpoints and the maximum flow cannot be maintained.

2) At High-High or Emergency wet well level, Operators shall be prompted to continue operation within the flow clamp limit (update the maximum flow setpoint with a larger one), or to switch back to level control. If acknowledgement is not completed before a 15 minute timer, operation shall continue with the flow clamp limit defined informing operators that the timer expired and no acknowledgement was made.

3) If wet well levels rise above the high-level alarms while in high flow clamp mode, the Operator shall be prompted via pop-up that levels are critically high in the wetwell and upstream facilities may be subject to flooding conditions. On the other hand, if level in the wetwell is low and flow falls below a user adjustable minimum setpoint initially set to 12MGD (field determined), the Operator shall be informed that the accuracy of the flow measurements will be marginally reduced until flow increases above this value.

C. Failure Scenarios:

1. East/West Wetwell level mismatch due to level instrumentation failure, or disagreement, or closure of one of the isolation knife gate valves (GV-0071-1 or GV-0071-2). Automatic level control shall be interrupted, running pumps shall continue operating at same speed, and Operators shall be informed via pop-up and alarm that level control is interrupted, and manual control of the pumping system is in place.
2. Lag pump start sequence not initiated by operator within an initially set time of 5 minutes shall inform operators via pop-up and alarm that level conditions in the wetwell will potentially exceed the wetwells capacity and upstream flooding is likely to occur.
3. If a selected the electromagnetic flowmeters fails, flow clamp mode shall be disabled. Operator shall be prompted via pop-up that flow clamp mode is disabled due to flowmeter failure, and downstream facilities may be subject to flooding conditions.
4. Operator switchover of any running pump from Remote to Local at the respective PCP, when the pumps are running in Level Control Mode, or the pump is switched from automatic to manual at the HMI the automatic Level Control Mode shall be cancelled, operating pumps shall remain on at the speed they were running. A clear and prominent indication on the HMI shall inform Operators that Automatic Level Control is cancelled and that running Pump(s) will continue running in manual mode.

LOOP FE-0065-X - SCREENED INFLUENT FLOW

A. General: Continuous monitoring of screened influent flow by means of a flow transmitter to SCADA (FE/FIT-0065-1 and FE/FIT-0065-2).

B. Control: Screened influent flow indication used for compliance and to control the Influent Pumps as described in LOOP LC-0050-X - WET WELL LEVEL CONTROL, article B.4.i, above.

C. Alarms/Monitoring:

1. Provide flow totalization, analog alarming, and monitoring as described in “Accumulators and Totalizers,” “General Controls and Monitoring,” and “Alarming and Equipment Failures” Articles of this section.

2. Generate a NO FLOW alarm if no flow is measured while any of the Influent Pumps are running.

D. Data Collection: Provide historical data collection as described in "Historical Data Collection" Article of this section.

LOOPS KGV-0054-1, KGV-0055-X, GV-0056-1, GV-0071-X, KGV-0073-X - GATE VALVES and KNIFE GATE VALVES

A. General: Gate valves provided with OPEN/STOP/CLOSE (O/S/C) and LOCAL/REMOTE (L/R) hand switches at the respective actuator. The actuator's L/R selector switch shall be left in "Remote" during normal operation. The actuators shall also be provided with accessible Local Control Stations (LCS) at the ground level, with the same hand controls and functionality. Under normal operating conditions, the LCS' L/R selector switch shall also be placed in the "Remote" position.

B. Control:

1. Local (at Actuator Controller):

a. Remote/Local Switch
b. Open/Close Switch

2. Remote, at the respective Remote Control Station (RCS), on the ground level:

a. Remote/Local Switch
b. Open/Close switch

3. PLC-PCPs:

a. Monitoring and control shall be provided at the OIT-PCPs. Operators shall be provided with means to operate the Actuators through soft controls, when both the Actuator and the RCS' Remote/Local switches are in the Remote position.

4. PLC-IPS

a. PLC-IPS shall monitor the open and close limit switch signals of actuators regardless of the position of the L/R selector switches.
b. When the selector switches at both the actuator and its associated LCS, are in "Remote", these actuators are controlled and monitored by PLC-IPS.

C. Alarms/Monitoring:

1. Remote.
2. Overload.
3. Opened.
4. Closed.
5. Data Collection: Provide historical data collection as described in "Historical Data Collection" Article of this section.

LOOP MS-0050-1X - ELECTRICAL EQUIPMENT MONITORING

A. General: Monitors KW usage for each motor starter.

B. Control:

1. Local: None

C. SCADA PLC/OWS:

1. Indications shall be provided at the respective OIT-PCP and SCADA

D. Alarms / Monitoring:

1. SCADA PLC/OWS:

a. KW usage

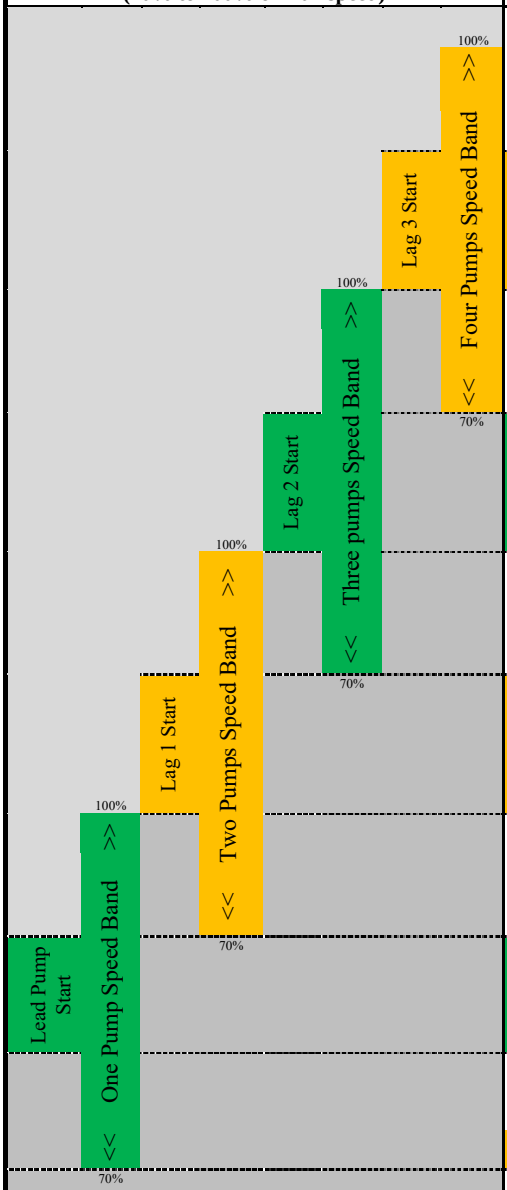
LOOP UA-0080 – VENTILATION EQUIPMENT MONITORING

A. General: Ventilation failure conditions shall be monitored at the SCADA level. PLC-IPS shall monitor the alarm statuses shown.

B. Alarms/Monitoring:

1. SCADA PLC/OWS:

a. Trouble: Ventilation loss of flow
b. Alarm: Ventilation loss of flow
c. Trouble: Current transducer failure
d. Alarm: Current transducer failure
e. Trouble: Silence button initiated
f. Alarm: Silence button initiated
g. Trouble: VF Panel
h. Alarm: VF Panel.



3.8 ATTACHMENTS

A. Attachment 1 - Cedar Creek Influent Pumping System Wet Well Level Setpoints

Attachment 1

CEDAR CREEK INFLUENT PUMPING SYSTEM WET WELL LEVEL SETPOINTS		
Pump Speed Proportional Level Control Bands **(70% to 100% of max speed)**	**EL**	**Pump Start/Stop Control**
	**-8.95**	Top of level range (20mA)
	-15.45	Emergency wetwell Level Alarm (Surge relief @ EL-14.95)
	-17.15	**On increasing level: Start Lag 3 Pump**: Running pumps to ramp down to minimum speed (70%). Start Lag 3 pump and ramp speed up to satisfy Cone Valve Diff. Press setpoint. Once Lag 3 cone valve is open, pumps ramp up and down in sync.
	TBD	On decreasing level: Four pumps running at minimum speed (70%). Stop Lag 3 Pump. Resume level control with remaining pumps.
	-17.65	**On increasing level: Start Lag 2 Pump**: Running pumps to ramp down to minimum speed (70%). Start Lag 2 pump and ramp speed up to satisfy Cone Valve Diff. Press setpoint. Once Lag 2 cone valve is open, pumps ramp up and down in sync.
	TBD	On decreasing level: Three pumps running at minimum speed (70%). Stop Lag 2 Pump. Resume level control with remaining pumps.
	-18.65	**On increasing level: Start Lag 1:** Lead pump to ramp down to minimum speed (70%). Start Lag 1 pump and ramp speed up to satisfy Cone Valve Diff. Press setpoint. Once Lag 1 cone valve is open, pumps ramp up and down in sync.
	TBD	On decreasing level: Two pumps running at minimum speed (70%). Stop Lag 1 Pump. Resume level control with remaining pump.
	-20.65	**On increasing level: Start Lead Pump** once the cone valve is open the pump modulates speed as needed
	-21.65	On decreasing level: **Stop Lead pump**
--- --- --- --- --- --- --- ---	**-23.65**	Pump Volute Centerline
	-34.65	Bottom of Radar Level range (4mA)
Notes: This chart or something similar shall be programmed in the OWS, OIT-PCP and PLC-IPS. Tentative values being provided. Confirm on the field during startup and testing procedures in accordance with LOOP LC-0050-X B.1.

SECTION 406263 - OPERATOR INTERFACE TERMINALS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

1. Section includes operator interface terminals.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406343 “Programmable Logic Controllers.”
3. Section 406717 “Industrial Enclosures.”
4. Section 406863 “Configuration of HMI Software.”

1.3 DEFINITIONS

A. Operator Interface Terminal (OIT): A hardware component of the HMI used for device level control and monitoring.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

B. Shop Drawings:

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Operator Interface Terminals: One spare OIT.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience, and with service facilities within 150 miles of Project.

1.10 TECHNOLOGY OBSOLESCENCE MITIGATION

A. Due to rapidly evolving technology of the equipment specified herein, the requirements specified are to establish a baseline for the type of equipment required. Provide the current version of hardware and software of similar specification at the time of purchase equivalent in cost to that which is specified. The procedure for submitting and releasing the equipment is as follows:

1. PCSS to submit for approval the required data for the equipment as part of the,,, Hardware and Submittal.
2. Order equipment as late as possible dependent on the construction schedule to ensure the latest equipment available is provided. Just prior to ordering, resubmit for approval the required data of the latest available hardware and software equivalent in cost to that which is specified. Do not order equipment more than 3 months prior to when it is needed to be continuously used on the project.

1.11 DELIVERY, STORAGE, AND HANDLING

A. As indicated by the Manufacturer.

1.12 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.13 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 OPERATOR INTERFACE TERMINAL (OIT)

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Rockwell Automation Allen-Bradley – PanelView Plus 7 Performance series.
b. Schneider Electric – Harmony series
c. Substitutions: Or equal

B. General

1. OITs are standalone devices with an integrated hardware/software platform to monitor and control a process through an interactive display.

C. Features

1. Software:

a. OITs pre-packaged with all configuration and programming software necessary to perform functions as shown on drawings and within the specifications.
b. Integrated OIT software has the following features:

1) Trending
2) Data logging
3) Alarms
4) Graphic symbols
5) Animations

2. Hardware:

a. Minimum one Secure Digital (SD) card slot

D. Communications

1. Ports:

a. Minimum two (2) 10/100MB Ethernet
b. Minimum one (1) USB
c. Minimum one (1) serial RS-232

2. Protocols:

a. EtherNet/IP
b. Modbus TCP/IP

E. Display:

1. Provide OIT screen sizes as shown on the drawings. If not explicitly specified provide a minimum of 15" viewable as measured diagonally across screen.
2. Minimum display resolution

a. 1024 x 768 for 12" to 15” displays
b. 1280 x 1024 for displays larger than 15”

3. Color Active Matrix TFT.
4. Display supports touch screen input.

F. Environmental:

1. Rating: OIT rated to maintain the rating of the control panel it will be mounted on and meet the area classification.
2. Operating Temperature: 32 to 122 degrees F

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and rooms for suitable conditions where operator interface terminals will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

© 2026 CDM Smith
All Rights Reserved

3.4 IDENTIFICATION

A. Refer to control system architecture for tagging designations

3.5 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.6 SOFTWARE SERVICE AGREEMENT

A. Not Required.

END OF SECTION 406263

SECTION 406343 - PROGRAMMABLE LOGIC CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes programmable logic controllers.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Analog Input (AI): An electrical signal (1-5 Volts DC or 4-20 milliamps, for example) to be interpreted by a PLC.

B. Analog Output (AO): An electrical signal (1-5 Volts DC or 4-20 milliamps, for example) sent from a PLC to a field device.

C. Digital/Discrete Input (DI): A binary signal (0 or 1) to be interpreted by a PLC.

D. Digital/Discrete Output (DO): A binary signal (0 or 1) sent from a PLC to a field device.

E. Input/Output (I/O): Analog or digital field instrument signals to be received and interpreted by a PLC.

F. Human Machine Interface (HMI): A software-based user interface with supervisory level control and of machine level equipment.

G. Operator Interface Terminal (OIT): A hardware component of the HMI used for device level control and monitoring.

H. Peer to Peer: Communication between two or more devices, typically PLC’s, in which each device can control the communication exchange.

I. Programmable Logic Controller (PLC): A ruggedized programmable computer used for industrial automation.

J. Remote I/O (RIO): I/O that is located remotely from the processor. Remote I/O can communicate over a variety of communication protocol and can use standard rack based I/O, or specialized Remote I/O hardware referred to as Distributed I/O.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

B. Shop Drawings:

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. The provided system shall be built/simulated in manufacturer’s tools, such as Integrated Architecture Builder by Rockwell Automation. A report demonstrating no errors or warnings in the proposed system shall be provided.

a. An as-built version of the report shall be provided as part of Final System Documentation.

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. CPUs: Provide one spare CPU for each unique CPU installed.
2. Power Supplies: Provide two spare power supplies for each unique power supply installed.
3. Chassis: Provide one spare chassis for each unique size installed.
4. I/O Cards: Provide spares for each unique I/O module type installed. Provide two 2 or 10 percent of installed quantity, whichever is greater.
5. Network interface, remote I/O, and communication modules: Provide one 1 spare module for each unique type of module installed.
6. Miscellaneous components (including cables): Provide spares for each unique component installed.

© 2026 CDM Smith
All Rights Reserved

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience, and with service facilities within 100 miles of Project.

1.10 TECHNOLOGY OBSOLESCENCE MITIGATION

A. Due to rapidly evolving technology of the equipment specified herein, the requirements specified are to establish a baseline for the type of equipment required. Provide the current version of hardware and software of similar specification at the time of purchase equivalent in cost to that which is specified. The procedure for submitting and releasing the equipment is as follows:

1. PCSS to submit for approval the required data for the equipment as part of the Hardware and Software Packages Submittal.
2. Order equipment as late as possible dependent on the construction schedule to ensure the latest equipment available is provided. Just prior to ordering, resubmit the required data of the latest available hardware and software, equivalent in cost to that which is specified for approval. Do not order equipment more than 3 months prior to when it is needed to be continuously used on the project.

1.11 DELIVERY, STORAGE, AND HANDLING

A. As indicated by the manufacturer.

1.12 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.13 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Configuration:

1. Refer to drawings for PLC configurations and network connections. For systems shown with redundant PLCs on the drawings, hot-standby processors must be provided. The device configuration must allow for instantaneous failover to the secondary PLC.

2.2 SPARE I/O, SLOTS, AND FUTURE EXPANSION

A. Spare PLC I/O:

1. Provide 20 percent points per type AI AO**,** DI, and DO for future use.
2. Provide spare I/O points of same type of I/O modules supplied.

B. Spare PLC Slots (Chassis-Based PLC Systems): Provide at least 2 spare slots for addition of future I/O in each chassis provided.

C. Future PLC Expansion (Non-Chassis-Based PLC Systems):

1. Provide adequate space to the right of the last I/O card per row of I/O cards for 2 future I/O cards.
2. Card width based on the widest I/O card provided in panel.

D. Provide external relays for spare output points that require their use.

E. Wire all unused points on all I/O to terminal blocks in the order that they occur on the I/O modules.

2.3 CHASSIS BASED PLC SYSTEM

A. Manufacturers:

1. Provide all PLCs from a single manufacturer. If the PLC manufacturer has authorized third party vendors to provide modules that are compatible with their platforms, then products manufactured by these authorized third-party vendors will be acceptable.
2. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

   a. Rockwell Automation Allen-Bradley – 1756 -L 8 ControlLogix
   b. Schneider Electric – M580
   c. Substitutions: Or equal.

B. General:

1. Provide processor, power supply, I/O modules, communication modules, redundancy modules, and remote interface modules as required to meet system requirements.
2. Listed and classified by UL, CSA, or FM approval as suitable for purpose specified and indicated.
3. Contains the required memory and functional capacity to perform the specified sequence of operation with the scheduled inputs and output points.
4. Designed for continuous industrial service.
5. Provide products of a single manufacturer.
6. Provide equipment models that are currently in production.

7. In the event of power interruption, the system undergoes an orderly shutdown with no loss of memory and resumes normal operation without manual intervention when power is restored.
8. Provide PLCs that communicate between workstations, servers, instruments, switches, controllers, process actuators, etc. as shown on the Drawings.
9. PLC capable of stand-alone operation in the event of failure of the communication link to the HMI subsystem.

C. Physical:

1. Vibration: 3.5mm Peak-to-Peak, 5-9 Hz: 1.0G, 9-150 Hz. Vibration tested in accordance with IEC 68-2-6 and JIS C 0911. The system is to be operational during and after testing. Vibration Rating of 2.0G maximum peak acceleration for 10 to 500 Hz. In accordance with one of the following:

    a. DIN rail mounted PLC, 10 – 57 Hz., amplitude 0.075 mm, acceleration 25-100 Hz.
    b. Panel or plate mounted PLC: 2-25 Hz., amplitude 1.6mm, acceleration 25-200 Hz.
    c. In compliance with IEC 60068 and IEC 61131.

2. Shock: 15G, 11msec. Shock tested in accordance with IEC 68-2-6 and JIS C 0911. The system is to be operational during and after testing.
3. Operating Temperature: 32 to 140 degrees F.
4. Storage Temperature: -13 to 158 degrees F.
5. Relative Humidity: 10 to 95 percent, non-condensing.
6. Noise Immunity: Tested to operate in the high electrical noise environment of an industrial plant as governed by the following regulations: IEEE 472, IEC 801, MILSTD 461B, IEC 255-4, NEMA ICS 2-230.40, and ANSI/IEEE C-37.90A-1978.
7. Altitude (Operating): 0 to 6,500 feet.
8. Altitude (Storage): 0 to 9,800 feet.
9. Degree of protection: NEMA 1 (IP20).
10. All products have corrosion protection.

D. Identification

1. Identify all major assemblies and sub-assemblies, circuit boards, and devices using permanent labels or markings indicating:

    a. Module product type such as analog or digital.
    b. Module catalog number.
    c. Module major revision number.
    d. Module minor revision number.
    e. Module manufacturer vendor.
    f. Module serial number.

E. PLC Central Processing Unit (CPU):

1. General:

    a. Minimum 16-bit microprocessor with system timing and is responsible with scheduling I/O updates with no user programming required to ensure discrete or analog update.

b. Executes user relay ladder logic programs, communicates with intelligent I/O modules, and performs on-line diagnostics.
c. Consists of a single module which solves application logic, stores the application program, stores numeric values related to the application processes and logic, and interfaces to the I/O.
d. Samples all discrete and analog inputs and outputs including internal coils and registers, and service special function modules every scan. The CPU processes the I/O with user programs(s) stored in memory and controls outputs based on the results of the logic operation.
e. Supply the CPU with a battery-backed time of day clock and calendar.
f. CPU family allows for user program transportability from one CPU model to another.

2. Diagnostics:

a. Perform on-line diagnostics that monitor the internal operation of the PLC. If a failure is detected, initiate orderly system shutdown and fail-over. Monitor the following, at a minimum:

1) Memory failure
2) Memory battery low
3) General fault
4) Communications port failure
5) Scan time over run
6) I/O failure
7) Analog or special function I/O module failure

b. Make diagnostic information accessible to the host communications interfaces and to the PLC program.
c. PLC indicators and on-board status area for the following conditions:

1) CPU run.
2) CPU error or fault.
3) I/O failure or configuration fault.
4) Status of Battery or back-up power module.
5) Communications indicator.

3. Memory

a. Provide non-volatile battery backed memory of type CMOS RAM program memory or equivalent.
b. Memory Backup System: Provide lithium battery backup or equivalent capable of retaining all memory for a minimum of three months and a Flash memory system capable of reloading program in the event of memory loss.

1) Backup Storage: Provide backup battery or capable of being replaced without disrupting memory integrity. Provide a visual indication of low battery voltage or module error and an alarm bit in the PLC program.
2) SD Memory Card: Provide memory card storage with capacity greater than processor memory capacity. Install memory cards in processors for factory testing.

c. Operating system contained in non-volatile firmware.
d. The memory containing the operating system is field updateable via a separate update tool.

4. Programming Environment

a. Programming port: Use PLC Ethernet port for programming.
b. On-Line programming: Application programs may be modified or stored while the CPU is running, with minimal impact on the scan time.
c. Online programming including runtime editing.
d. IEC 61131-3 programming languages supported: Ladder logic, function block, sequential function chart, and structured text.
e. Supply all hardware and software necessary to program the CPU in these languages.

5. Communication Ports:

a. Provide expandable CPU supplied with additional modules to support the required communication interfaces.

6. Remote I/O Communications:

a. Provide CPU capable of communicating with up to 12 remote base locations. Automatically sample and update all local and remote I/O modules each scan cycle of the CPU.
b. Provide communication link between the CPU and any RIO chassis as recommended by the PLC manufacturer.
c. Provide diagnostic and equipment status information from each RIO.
d. Provide remote I/O system with a remote input/output arrangement capable of operation at locations physically separated from the PLC CPU as detailed on the drawings.
e. Communicate with the remote I/O arrangement through cable as recommended by the PLC manufacturer and provided by the PLC system supplier under this specification Section.

7. Controller Redundancy:

a. Provide PLC with all hardware and software required to produce a completely operational redundant system if shown in the Drawings. Redundancy can be implemented using a minimum amount of user programming. Warm backup, which is not a standard offering from the PLC manufacturer, is not acceptable.
b. Provide backup system consisting of redundant controllers located in separate chassis.
c. Provide bumpless switchover for system outputs. All I/O points maintain its last position until either communication is re-established, or the remote I/O watchdog timer expires.
d. Switch-over between the on-line PLC and the back-up PLC occurs within 100 milliseconds if any of the following conditions occurs in the on-line unit:

1) Power failure
2) CPU fault

3) Communications module fault
4) Change in the on-line unit's mode from RUN to PROGRAM

e. Transparent switchover to any devices networked to the redundant controller chassis.
f. Automatically cross-load the primary controller's program to the secondary controller.
~~g.~~ System diagnostics and debugging tools available to troubleshoot all redundancy equipment.

F. Power Supplies:

1. Power Input: 85 to 265VAC, 47 - 63Hz.
2. Provide DC power supplies capable of handling ripple up to 2.4V peak to peak.
3. Chassis mounted power supplies to power the chassis backplane and provide power for the processor and applicable modules.
4. Provide clearly visible LED to indicate that the incoming power is acceptable, and the output voltage is present.
5. Provide over-current and over-voltage protection designed to operate in most industrial environments without the need for isolation transformers.
6. Size power supplies to accommodate the nominal load plus 30%.
7. Provide power supplies capable of sustaining brown out conditions of at least 1/2 of a cycle, a harmonic rate of 10%, and continuous operation through momentary interruptions of AC line voltage of 10ms or less.
8. Automatically shut down the PLC system whenever its output power is detected as exceeding 125% of its rated power.
9. Provide surge protection, isolation, and outage carry-over up to 2 cycles of the AC line.
10. Power Supply Redundancy

a. Provide redundant power supplies that comply with all the requirements of non-redundant power supplies in addition to the features stated below.
b. Design redundant power supplies to share the current required by the chassis.
c. In the event of a failure of one redundant power supply, the remaining supply accommodates the entire load of the chassis without disruption to the chassis activity.
d. Provide a failsafe fuse that is not accessible by the customer.
e. Provide a solid-state relay connection to allow for failure annunciation when wired to an input module.
f. Provide diagnostic LED status indicators for Power and redundancy.

G. Chassis:

1. Distribute all system and signal power to the CPU and support modules on the backplane. No interconnecting wiring between these modules via plug-terminated jumpers is acceptable.
2. Provide free air cooling for all system modules, main and expansion chassis. No internal fans or other means of cooling except heat sinks is permitted.
3. Provide means to remove all system modules from the chassis or inserted to the chassis while power is being supplied to the chassis without faulting the processor or damaging the modules.

4. Modules designed to plug into a chassis and to be keyed to allow installation in only one direction. The design must prohibit upside down insertion of the modules as well as safeguard against the insertion of a module into the wrong slot or chassis via an electronic method for identifying a module. Perform an electronic keying check to ensure that the physical module is consistent with what was configured.

H. Discrete Input & Output Modules:

1. General:

   a. Digital input and output modules provide ON/OFF detection and actuation capability.
   b. Provide cards of I/O type and count as required to implement the functions specified plus an allowance for active spares, as specified herein.
   c. Provide modules capable of being installed or removed while chassis power is applied.
   d. Provide the following status indicators.

      1) On/Off state of the field device.
      2) Module's communication status.
      3) Module health

2. Module Specifications – 120VAC Input Module

   a. Nominal Input Voltage: 120VAC
   b. On-State Current: 15mA at 132VAC, 47 - 63Hz maximum.
   c. Maximum Off-State Voltage: 20V.
   d. Maximum Off-State Current: 2.5mA.
   e. Number of Points per Card: 16.

3. Module Specifications – Individually Isolated Relay Output Module

   a. Output Voltage Range: 10 - 265VAC, 47 - 63 Hz, 5 - 125VDC.
   b. Output Current Rating:

      1) Per Point: 2.5A maximum.
      2) Per Module: 16A maximum.

   c. Power Rating (Steady State): 250VA maximum for 125VAC inductive output.
   d. Maximum Off-State Leakage: 0 mA per point.
   e. Configurable States:

      1) Fault per Point: Hold Last State, ON or OFF.
      2) Program Mode per Point: Hold Last State, ON or OFF.

   f. Number of Points per Card: 16.

I. Analog Input & Output Modules:

1. General:

a. Analog input modules convert an analog signal (1 to 5 Volts DC, 4 to 20 milliamps, for example) that is connected to the module's screw terminals into a digital value. The digital value representing the magnitude of the analog signal is transmitted on the backplane.
b. Furnish analog output modules to convert a digital value that is delivered to the module via the backplane into an analog signal on the module's screw terminals.
c. Provide modules designed to be installed or removed while chassis power is applied.
d. Provide the following status indicators:

1) Module's communication status.
2) Module health
3) Input/output devices

e. Hardware and software indication provided when a module fault has occurred. Each module provided with an LED fault indicator and the programming software displays the fault information.
f. Provide analog modules that are software configurable through the I/O configuration portion of the programming software.
g. Following status can be examined in ladder logic:

1) Module Fault Word: Provides fault summary reporting.
2) Channel Fault Word: Provides under-range, over-range and communications fault reporting.
3) Channel Status Words: Provides individual channel under-range and over-range fault reporting for process alarm, rate alarms and calibration faults.

h. Provide 24 VDC power for analog instrument loops as a part of the system. Derive 24 VDC power supply from the 120 VAC input power circuit to the PLC. Group the field side of the 24 VDC power sources(s) as individual or grouped (of logically associated circuits) fusing and provide with a readily visible, labeled blown fuse indicator.

2. Differential Analog Input Module:

a. Input Range: 0-20 mA.
b. Resolution: approximately 16 bits across range.
c. Input Impedance: Greater than 249 Ohms.
d. Overvoltage Protection: 8V ac/dc with on-board current resistor.
e. Normal Mode Rejection: 60 dB at 60 Hz.
f. Common Mode Noise Rejection: 120 dB at 60 Hz, 100 dB at 50 Hz.
g. Isolation Voltage:

1) Channel to Ground/Chassis - 100% tested at 1000 VDC minimum for 1s based on 250 VAC.

h. Provide individual isolators, in addition to the surge suppression devices specified, in the control panels listed in Section 406717 for all signals that enter the panel from outside the building. Substitution of isolated analog input cards to meet this requirement is acceptable.
i. Number of Points per Card: 8.

3. Isolated Analog Output Current Module:

    a. Output Current Range: 4 to 20 mA.
    b. Current Resolution: 12 bits across 20 mA.
    c. Open Circuit Detection: None.
    d. Output Overvoltage Protection: 24V DC/AC maximum.
    e. Output Short Circuit Protection: 20 mA or less (electronically limited).
    f. Calibration Accuracy: Better than 0.1% of range from 4 mA to 20 mA.
    g. Number of Points per Card: 8.

J. Communication Interfaces:

1. Supported protocols:

    a. EtherNet/IP.
    b. Modbus TCP/IP.

2. Ports:

    a. Two 100MB/1G Ethernet.
    b. USB.

3. Utilizing in-chassis communication modules or built-in ports on the PLC is acceptable to meet communication interface requirements.
4. Required Accessories:

    a. Provide protocol converters of the same approved PLC manufacturer as necessary. 3rd party protocol converters are not acceptable unless officially supported by the PLC manufacturer.

K. Required Accessories:

1. Include all necessary cables as specified by the manufacturer. Assemble and install cables per manufacturer recommendations.

2.4 COMPACT PLC SYSTEM

A. Manufacturers:

1. Provide all PLCs from a single manufacturer. If the PLC manufacturer has authorized third party vendors to provide modules that are compatible with their platforms, then products manufactured by these authorized third-party vendors will be acceptable.
2. Manufacturers and their products are subject to compliance with requirements. Provide the following:

    a. Rockwell Automation Allen-Bradley – 5069 CompactLogix
    b. Schneider Electric – Modicon M340
    c. Siemens – S7 300 series

B. General

1. Provide processor, power supply, I/O modules, communication modules, and remote interface modules as required to meet system requirements.
2. PLC is modular based, rather than chassis-based.
3. Listed and classified by UL, CSA, or FM approval as suitable for purpose specified and indicated.
4. Contains the required memory and functional capacity to perform the specified sequence of operation with the scheduled inputs and output points.
5. Designed for continuous industrial service.
6. Provide products of a single manufacturer.
7. Provide equipment models that are currently in production.
8. In the event of power interruption, the system undergoes an orderly shutdown with no loss of memory and resumes normal operation without manual intervention when power is restored.
9. Provide PLCs that communicate between workstations, servers, instruments, switches, controllers, process actuators, etc. as shown on the Drawings.
10. PLC capable of stand-alone operation in the event of failure of the communication link to the HMI subsystem.

C. Physical:

1. Vibration: 3.5mm Peak-to-Peak, 5-9 Hz: 1.0G, 9-150 Hz. Vibration tested in accordance with IEC 68-2-6 and JIS C 0911. The system is to be operational during and after testing. Vibration Rating of 2.0G maximum peak acceleration for 10 to 500 Hz. In accordance with one of the following:

    a. DIN rail mounted PLC, 10 – 57 Hz., amplitude 0.075 mm, acceleration 25-100 Hz.
    b. Panel or plate mounted PLC: 2-25 Hz., amplitude 1.6mm, acceleration 25-200 Hz.
    c. In compliance with IEC 60068 and IEC 61131.

2. Shock: 15G, 11msec. Shock tested in accordance with IEC 68-2-27 and JIS C 0912. The system is to be operational during and after testing.
3. Operating Temperature: 32 to 140 degrees F.
4. Storage Temperature: -13 to 158 degrees F.
5. Relative Humidity: 10 to 95 percent, non-condensing.
6. Noise Immunity: Tested to operate in the high electrical noise environment of an industrial plant as governed by the following regulations: IEEE 472, IEC 801, MILSTD 461B, IEC 255-4, NEMA ICS 2-230.40, and ANSI/IEEE C-37.90A-1978.
7. Altitude (Operating): 0 to 6,500 feet.
8. Altitude (Storage): 0 to 9,800 feet.
9. Degree of protection: NEMA 1 (IP20).
10. All products have corrosion protection.

D. Identification

1. Identify all major assemblies and sub-assemblies, circuit boards, and devices using permanent labels or markings indicating:

    a. Module product type such as analog or digital.
    b. Module catalog number.

c. Module major revision number.
d. Module minor revision number.
e. Module manufacturer vendor.
f. Module serial number.

E. PLC Central Processing Unit (CPU):

1. General:

a. Minimum 16-bit microprocessor with system timing and is responsible with scheduling I/O updates with no user programming required to ensure discrete or analog update.
b. Executes user relay ladder logic programs, communicates with intelligent I/O modules, and performs on-line diagnostics.
c. Consists of a single module which solves application logic, stores the application program, stores numeric values related to the application processes and logic, and interfaces to the I/O.
d. Samples all discrete and analog inputs and outputs including internal coils and registers, and service special function modules every scan. The CPU processes the I/O with user programs(s) stored in memory and controls outputs based on the results of the logic operation.
e. Supply the CPU with a battery-backed time of day clock and calendar.
f. CPU family allows for user program transportability from one CPU model to another.

2. Diagnostics:

a. Perform on-line diagnostics that monitor the internal operation of the PLC. If a failure is detected, initiate orderly system shutdown and fail-over. Monitor the following, at a minimum:

1) Memory failure
2) Memory battery low
3) General fault
4) Communications port failure
5) Scan time over run
6) I/O failure
7) Analog or special function I/O module failure

b. Make diagnostic information accessible to the host communications interfaces and to the PLC program.
c. PLC indicators and on-board status area for the following conditions:

1) CPU run.
2) CPU error or fault.
3) I/O failure or configuration fault.
4) Status of Battery or back-up power module.
5) Communications indicator.

3. Memory

a. Provide non-volatile battery backed memory of type CMOS RAM program memory or equivalent.
b. Memory Backup System: Provide lithium battery backup or equivalent capable of retaining all memory for a minimum of three months and a Flash memory system capable of reloading program in the event of memory loss.

1) Backup Storage: Provide backup battery or capable of being replaced without disrupting memory integrity. Provide a visual indication of low battery voltage or module error and an alarm bit in the PLC program.
2) Flash SD Memory Card: Provide memory card storage with capacity greater than processor memory capacity. Install memory cards in processors for factory testing.

c. Operating system contained in non-volatile firmware.
d. The memory containing the operating system is field updateable via a separate update tool.

4. Programming Environment

a. Programming port: Use PLC Ethernet port for programming.
b. On-Line programming: Application programs may be modified or stored while the CPU is running, with minimal impact on the scan time.
c. Online programming including runtime editing.
d. IEC 61131-3 programming languages supported: Ladder logic, function block, sequential function chart, and structured text.
e. Supply all hardware and software necessary to program the CPU in these languages.

5. Communication Ports:

a. Provide expandable CPU supplied with additional modules to support the required communication interfaces.

6. Remote I/O Communications:

a. Provide CPU capable of communicating with up to 12 remote base locations. Automatically sample and update all local and remote I/O modules each scan cycle of the CPU.
b. Provide communication link between the CPU and any RIO chassis as recommended by the PLC manufacturer.
c. Provide diagnostic and equipment status information from each RIO.
d. Provide remote I/O system with a remote input/output arrangement capable of operation at locations physically separated from the PLC CPU as detailed on the drawings.
e. Communicate with the remote I/O arrangement through cable as recommended by the PLC manufacturer and provided by the PLC system supplier under this specification Section.

F. Power Supplies:

1. Power Input: 85 to 265VAC, 47 - 63Hz.

2. Provide DC power supplies capable of handling ripple up to 2.4V peak to peak.
3. Power supply provide power for the processor and applicable modules.
4. Provide clearly visible LED to indicate that the incoming power is acceptable, and the output voltage is present.
5. Provide over-current and over-voltage protection designed to operate in most industrial environments without the need for isolation transformers.
6. Size power supplies to accommodate the nominal load plus 30%.
7. Provide power supplies capable of sustaining brown out conditions of at least 1/2 of a cycle, a harmonic rate of 10%, and continuous operation through momentary interruptions of AC line voltage of 10ms or less.
8. Automatically shut down the PLC system whenever its output power is detected as exceeding 125% of its rated power.
9. Provide surge protection, isolation, and outage carry-over up to 2 cycles of the AC line.

G. Discrete Input & Output Modules:

1. General:

   a. Digital input and output modules provide ON/OFF detection and actuation capability.
   b. Provide cards of I/O type and count as required to implement the functions specified plus an allowance for active spares, as specified herein.
   c. Provide modules capable of being installed or removed while chassis power is applied.
   d. Provide the following status indicators.

      1) On/Off state of the field device.
      2) Module's communication status.
      3) Module health

2. Module Specifications – 120VAC Input Module

   a. Nominal Input Voltage: 120VAC
   b. On-State Current: 15mA at 132VAC, 47 - 63Hz maximum.
   c. Maximum Off-State Voltage: 20V.
   d. Maximum Off-State Current: 2.5mA.
   e. Number of Points per Card: 16.

3. Module Specification – 120 VAC Solid State Output Module

   a. For each triac type discrete output, provide an associated interposing relay located in the same control panel. Provide 120 VAC power for relay outputs from the associated motor starter control circuit (when used with motor starters) or other 120 VAC source (when I/O is not associated with a particular motor starter).
   b. Output Voltage Range: 74 - 265 VAC, 47 - 63 Hz.
   c. Output Current Rating:

      1) Per Point: 0.5A maximum at 86 degrees F; 0.25A maximum at 140 degrees F; Linear Derating.
      2) Per Module: 4A maximum at 86 degrees F; 2A maximum at 140 degrees F; Linear Derating.

d. Surge Current per Point: 5A for 43ms each, repeatable every 2s at 140 degrees F.
e. Minimum Load Current: 10mA per point.
f. Maximum On-State Voltage Drop: 1.5V peak at 2.0A and 6V peak at load less than 50mA.
g. Maximum Off-State Leakage: 2.5mA per point.
h. Number of Points per Card: 16.

4. Module Specifications – Individually Isolated Relay Output Module

a. Output Voltage Range: 10 - 265VAC, 47 - 63 Hz, 5 - 125VDC.
b. Output Current Rating:

1) Per Point: 2.5A maximum.
2) Per Module: 16A maximum.

c. Power Rating (Steady State): 250VA maximum for 125VAC inductive output.
d. Maximum Off-State Leakage: 0 mA per point.
e. Configurable States:

1) Fault per Point: Hold Last State, ON or OFF.
2) Program Mode per Point: Hold Last State, ON or OFF.

f. Number of Points per Card: 16.

H. Analog Input & Output Modules:

1. General:

a. Analog input modules convert an analog signal (1 to 5 Volts DC, 4 to 20 milliamps, for example) that is connected to the module's screw terminals into a digital value.
b. Furnish analog output modules to convert a digital value that is delivered to the module into an analog signal on the module's screw terminals.
c. Provide modules designed to be installed or removed while power is applied.
d. Provide the following status indicators:

1) Module's communication status.
2) Module health
3) Input/output devices

e. Hardware and software indication provided when a module fault has occurred. Each module provided with an LED fault indicator and the programming software displays the fault information.
f. Provide analog modules that are software configurable through the I/O configuration portion of the programming software.
g. Following status can be examined in ladder logic:

1) Module Fault Word: Provides fault summary reporting.
2) Channel Fault Word: Provides under-range, over-range and communications fault reporting.

3) Channel Status Words: Provides individual channel under-range and over-range fault reporting for process alarm, rate alarms and calibration faults.

h. Provide 24 VDC power for analog instrument loops as a part of the system. Derive 24 VDC power supply from the 120 VAC input power circuit to the PLC. Group the field side of the 24 VDC power sources(s) as individual or grouped (of logically associated circuits) fusing and provide with a readily visible, labeled blown fuse indicator.

2. Differential Analog Input Module:

a. Input Range: 0-20 mA.
b. Resolution: approximately 16 bits across range.
c. Input Impedance: Greater than 249 Ohms.
d. Overvoltage Protection: 8V ac/dc with on-board current resistor.
e. Normal Mode Rejection: 60 dB at 60 Hz.
f. Common Mode Noise Rejection: 120 dB at 60 Hz, 100 dB at 50 Hz.
g. Isolation Voltage:

1) Channel to Ground/Chassis - 100% tested at 1000 VDC minimum for 1s based on 250 VAC.

h. Provide individual isolators, in addition to the surge suppression devices specified, in the control panels listed in Section 406717 for all signals that enter the panel from outside the building. Substitution of isolated analog input cards to meet this requirement is acceptable.
i. Number of Points per Card: 8.

3. Isolated Analog Output Current Module:

a. Output Current Range: 4 to 20 mA.
b. Current Resolution: 12 bits across 20 mA.
c. Open Circuit Detection: None.
d. Output Overvoltage Protection: 24V DC/AC maximum.
e. Output Short Circuit Protection: 20 mA or less (electronically limited).
f. Calibration Accuracy: Better than 0.1% of range from 4 mA to 20 mA.
g. Number of Points per Card: 8.

I. Communication Interfaces:

1. Supported protocols:

a. EtherNet/IP.
b. Modbus TCP/IP.
c. PROFINET.

2. Ports:

a. Two (2) 100MB/1G Ethernet.
b. USB.

3. Required Accessories:

    a. Provide protocol converters of the same approved PLC manufacturer as necessary. 3rd party protocol converters are not acceptable unless officially supported by the PLC manufacturer.

J. Required Accessories:

1. Include all necessary cables as specified by the manufacturer. Assemble and install cables per manufacturer recommendations.

2.5 PLC SOFTWARE

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

    a. As required to match supplied PLCs.

B. General:

1. Provide PLC configuration and application development software package complete with documentation and installation media.
2. Install the PLC software package and associated licensing and/or activation on the computers shown on the Drawings.
3. Allows for on-line/off-line program development, annotation, monitoring, debugging, uploading, and downloading of programs to the PLCs.
4. Provide all required hardware (including cables, cable adapters, etc.) for connection to PLCs.
5. Provide all software licenses required to achieve the functionality described in the Specifications.
6. Include a software license agreement allowing the Owner the right to use the software as required for any current or future modification, documentation, or development of the PLCs provide for this project.
7. Provide software capable of the following IEC 61131-3 functions:

    a. Ladder logic.
    b. Function block.
    c. Sequential function chart.
    d. Structured text.

8. Add-on instruction editor allows for the development of custom reusable function blocks. The software permits function block modification while on-line.
9. Software is Microsoft Windows-based and run on the supplied computers.
10. Software includes a security feature to prevent unauthorized personnel from modifying and downloading the programs.
11. Provide an I/O simulator which allows the PLC application load program to be tested on a PC with simulated analog and digital inputs and outputs, allowing I/O testing and

debugging to be performed in a safe, isolated environment without the need for running the PLC CPU and process I/O boards.

2.6 SOURCE QUALITY CONTROL

A. Testing: Test programmable controller according to NEMA IA 2.2.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Programmable Logic Controller will be considered defective if it does not pass tests and inspections.

B. Prepare test and inspection reports in accordance with the following:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 406121 “Process Control System Testing.”

© 2026 CDM Smith
All Rights Reserved

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 SOFTWARE SERVICE AGREEMENT

A. Technical Support: Beginning at Substantial Completion, service agreement includes software support for two years.

B. Upgrade Service: At Substantial Completion, update software and firmware to latest compatible version.

1. Upgrade Notice: At least 30 days to allow Owner to schedule and access the system and to upgrade computer equipment if necessary.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION 406343

SECTION 406613 - SWITCHES AND ROUTERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes switches and routers.

B. PCSS is responsible for performing configuration services for equipment provided under this section.

C. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”
3. Section 406343 “Programmable Logic Controllers.”

1.3 DEFINITIONS

A. Applications Engineering System Supplier (AESS): The entity who provides all programming, configuration, and related services for the control system equipment provided by the PCSS.

B. Control System Security Provider (CSSP): The entity who provides all programming, configuration, and services related to the implementation of cybersecurity countermeasures.

C. Fiber optic Ethernet switch (FOES): An Ethernet based networking device with a combination of fiber optic and copper physical connections.

D. Local Area Network (LAN): A localized group of network devices (e.g. buildings, homes, offices, etc.).

E. Managed Ethernet switch (MES): An Ethernet based networking device that permits the management, configuration, and monitoring of a local area network.

F. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

G. Power over Ethernet (PoE): A method of providing electrical current over an Ethernet connection.

H. Small form-factor pluggable (SFP): A hot-pluggable network interface module connecting a device motherboard (Ethernet switch, router, etc.) to a fiber optic or copper networking cable.

I. Unmanaged Ethernet Switch (UMES): An Ethernet based networking device with a fixed configuration (i.e. “plug-and-play” devices).

J. Virtual Private Network (VPN): An encrypted connection between a private network and a public network (the internet).

K. Wide Area Network (WAN): A network that covers a broad geographic area, typically through use of a public network (e.g. communication across cities, national boundaries, etc.).

L. IEEE: Institute of Electrical and Electronics Engineers.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

B. Shop Drawings:

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Ethernet Switches: One spare Ethernet switch for each type provided

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

© 2026 CDM Smith
All Rights Reserved

1.9 TECHNOLOGY OBSOLESCENCE MITIGATION

A. Due to rapidly evolving technology of the equipment specified herein, the requirements specified are to establish a baseline for the type of equipment required. Provide the current version of hardware and software of similar specification at the time of purchase equivalent in cost to that which is specified. The procedure for submitting and releasing the equipment is as follows:

1. PCSS to submit for approval the required data for the equipment as part of the Hardware Packages Submittal.
2. Coordinate title of this submittal with what is listed in Section 406100 “Process Control and Enterprise Management Systems General Provisions” for the same submittal title.
3. PCSS shall submit for approval the required data for the equipment as part of the Hardware Packages Submittal.
4. Order equipment as late as possible dependent on the construction schedule to ensure the latest equipment available is provided. Just prior to ordering, resubmit for approval the required data of the latest available hardware and software equivalent in cost to that which is specified. Do not order equipment more than 3 months prior to when it is needed to be continuously used on the project.

1.10 DELIVERY, STORAGE, AND HANDLING

A. As indicated by the Manufacturer.

1.11 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.12 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 INDUSTRIAL MANAGED ETHERNET SWITCH

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Allen-Bradley Stratix 5200 series
b. Cisco Catalyst IE3100 series
c. Moxa MDS-G4020 series
d. Or engineer approved equal.

B. General:

1. Provide a DIN rail mountable industrial managed Ethernet switch for connection to the network as shown in the Drawings and specified herein.
2. Provide ethernet switches by the same manufacturer for the project, regardless of type.

C. Physical Features:

1. Switches must include sufficient SFP slots and copper ports to accommodate all connected devices plus 10% spare. The minimum number of ports is included in Table 1 in the switches and routers schedule below. Additional ports may be required based on network connected equipment shown on the drawings.

    a. SFP slots: Refer to Table 1 in the switches and routers schedule.
    b. Copper ports: Refer to Table 1 in the switches and routers schedule.

2. Operating temperature: 0 to 130 degrees F
3. Power: redundant 24VDC power input.
4. Enclosure: Metal case.
5. Rating: UL Class 1, Division 2 Groups A, B, C, and D.

D. Network Features:

1. Layer 2 routing.
2. Spanning Tree Protocol (STP).
3. Rapid Spanning Tree Protocol (RSTP) (IEEE 802.1w).
4. 802.1q VLAN tagging protocol
5. Full duplex on all ports.
6. Auto negotiation and manual configurable speed and duplex.
7. Wire speed switching fabric.
8. IGMP snooping.
9. IGMP filtering.
10. Configuration password protected.
11. Configuration backup capability required.
12. SNMP V3.
13. Lock port function for blocking unauthorized access based on MAC address.

E. Additional Features:

1. Provide a dry contact rated for 120 VAC 5A to be used as a programmable common trouble alarm. If the contact cannot use 120 VAC 5A, provide the necessary 24 VDC power from the PLC panel and provide interposing relays in the PLC panel.
2. For switches located in control panels shown as connected in a device ring, provide switch capable of being connected with PLC, OIT, and any other equipment shown in the device ring.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and rooms for suitable conditions where computers will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to control system architecture for tagging designations

3.5 FIELD QUALITY CONTROL

A. Switchers and routers will be considered defective if they do not pass tests and inspections.

B. Prepare test and inspection reports in accordance with the following:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 406121 “Process Control System Testing.”

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. For Managed Ethernet Switches: Refer to Section 408100 “Industrial Control System Cyber Security“ for additional configuration requirements.

a. Enable the lock port function to block unauthorized access based on MAC address for each switch and router. Assign static IP addresses to devices connecting to switch.

3. Lock down all spare switch and router ports.

3.7 SOFTWARE SERVICE AGREEMENT

A. Technical Support: Beginning at Substantial Completion, ensure service agreement includes software support for two years.

B. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Ensure upgrading software includes operating system and new or revised licenses for using software.

1. Upgrade Notice: At least 30 days in advance to allow Owner to schedule and access the system and to upgrade computer equipment if necessary.

3.8 SWITCHES AND ROUTERS SCHEDULE

A. Provide the devices in the following schedules:

Table 1. Ethernet Switch Schedule

Switch Designation	Type	Mount	Fiber Uplinks (1G SFP)	Copper Ports (10/100/1000 Base-T(X), RJ45)
MES-IPS 1 and MES-IPS-2	Managed Ethernet Switch	DIN Rail	2	18
MES-PCP-1 through MES-PCP-6	Managed Ethernet Switch	DIN Rail	2	8

END OF SECTION 406613

SECTION 406717 – INDUSTRIAL ENCLOSURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes industrial enclosures.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406733 “Panel Wiring.”
3. Section 26053X “Sections for electrical raceways and covers.”
4. The X in the number indicates spec sections starting with the first 5 numbers (indicating a category described in the accompanying text) are included in the reference.

1.3 DEFINITIONS

A. Section 26053X “Sections for electrical raceways and covers”: The X in the number indicates spec sections starting with the first 5 numbers (indicating a category described in the accompanying text) are included in the reference.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

B. Shop Drawings:

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Touch-up Paint: Provide touch-up paint of each type and color used for cabinets, panels, and consoles supplied.

1.8 QUALITY ASSURANCE

A. Perform work in accordance with UL 508.

B. Provide components compatible with functions required to form complete working system.

C. Provide UL 508 label on complete assembly.

D. Maintain one copy of panel drawings on site.

1.9 DELIVERY, STORAGE, AND HANDLING

A. As indicated by the Manufacturer.

1.10 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.11 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 INDUSTRIAL ENCLOSURES

A. Manufacturers

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. nVent: Hoffman.
b. Rittal.

c. Saginaw.
d. Substitutions: Or equal

B. Structure and Enclosure

1. Panels in indoor, dry, non-corrosive environments:

a. NEMA 12, painted steel or aluminum construction, as required by the schedule in PART 3.

2. Panels in outdoor, wet, or chemically corrosive environments:

a. NEMA 4X, stainless-steel or FRP construction, as required by the schedule in PART 3.

3. Panels located in hazardous locations:

a. Rated for the type of hazard (e.g., NEMA 7 for Class 1, Division 1).

4. Construction:

a. Freestanding and floor-mounted vertical panels:

1) Panels of 12-gauge sheet steel
2) Front panels or panels containing instruments: provide 10-gauge stretcher-leveled sheet steel, reinforced to prevent warping or distortion.

b. Wall and Unistrut mounted panels:

1) Panels no less than 14-gauge steel,

c. Consoles:

1) Panels of 12-gauge sheet steel
2) Front panels: provide 10-gauge stretcher-leveled sheet steel, reinforced to prevent warping or distortion.

5. Provide angle stiffeners on the back of the panel face to prevent panel deflection under instrument loading or operation, as follows:

a. Structural framework internal to the panel allows for instrument support and panel bracing.
b. Interior structure framework to permit panel lifting without racking or distortion.
c. Removable lifting rings designed to facilitate simple, safe rigging, and lifting of the control panels during installation.

6. Full height and fully gasketed access door with full-length, continuous, piano type stainless steel hinges with stainless steel pins.

a. Provide doors with three-point stainless steel latch and heavy-duty stainless-steel locking handle.

b. Provide front access doors of sufficient width to permit instrument or control device mounting without interference from flush mounted instruments.
c. Clamp-type door latches are not permitted.

7. Avoid kinks and sharp bends in wiring.

a. Route wiring for easy access to other components for maintenance and inspection purposes.

8. Panel suitable for top and bottom conduit entry as required by the Electrical Drawings

a. For top mounted conduit entry, provide panel top with nominal one-foot square removable access plates, which may be drilled to accommodate conduit and cable penetrations.
b. Provide conduit and cable penetrations with ground bushings, hubs, gasketed locknuts, and other accessories as required to maintain the NEMA rating of the panel and electrical rating of the conduit system.

C. General Requirements

1. UL labeled control panels and cabinets.

a. UL listing includes enclosure, specific equipment supplied with enclosure, and equipment installation and wiring within and on the enclosure. If required for UL labeling, provide ground fault protective devices, isolation transformers, fuses and other equipment necessary to achieve compliance with UL 508A requirement. The Drawings do not detail UL 508A requirements.

2. Panel door handles with lock, or a hasp and staple for padlocking: key the locks for control panels provided under this Contract alike.
3. Arrange devices for rear of panel mounting within the panel according to respective panel drawings and in a manner to allow for ease of maintenance and adjustment.

a. Locate heat generating devices, such as power supplies, at or near the top of the panel.

4. Mount components in a manner that permits servicing, adjustment, testing, and removal without disconnecting, moving, or removing any other component.

a. Mount interior panel components on removable plates (sub-panels) and not directly on the enclosure.
b. Unless shock mounting is required by the manufacturer to protect equipment from vibration, provide rigid and stable mounting.
c. Mount and orient components in accordance with manufacturer’s recommendations.
d. Identify internal components with suitable plastic or metal engraved nametags mounted adjacent to (not on) each component identifying the component in accordance with the drawings and specifications.

5. Mount panel components on a single rear-of-panel sub-panel unless the density of devices exceeds the panel mounting space permitted by the minimum panel dimensions

specified. Side panel mounted components are not permitted without review and approval by Engineer.

6. Type 316 stainless-steel hardware and fasteners:

    a. Provide drilled and tapped mounting screws; self-tapping screws are not permitted.

7. Install suitable gaskets and faceplates, required to maintain NEMA rating of the panel.
8. Intrinsically safe (IS) circuits must comply with the requirements of NEC (NFPA 70 Art. 504):

    a. Provide circuit separation in enclosures using one of the following methods. Indicate which methods are utilized in the submittal drawings required by Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

        1) Secure conductors such that they cannot come loose from a terminal and come into contact with another terminal.
        2) Provide separation by at least 2 inches from conductors of any non-intrinsically safe circuits
        3) Provide separation from conductors of non-intrinsically safe circuits by use of rigid insulating partition 0.0359 inch or thicker that extends to within 0.0625 inch of the enclosure walls.
        4) Use of separate wiring compartments for intrinsically safe and non-intrinsically safe terminals

    b. Provide protection between different intrinsically safe circuit conductors within the same enclosure using one of the following techniques. Indicate which methods are utilized in the submittal drawings required by Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

        1) Provide a minimum of 0.25 inch of clearance between two terminals of field wiring of different intrinsically safe circuits.
        2) Provide conductors of each circuit are within a grounded metal shield.
        3) Provide conductors with insulation with a minimum thickness of 0.01 inch.

    c. Provide a minimum of 0.125 inch clearance between the uninsulated parts of field wiring conductors connected to terminals and grounded metal or other conducting parts.
    d. IS systems must be grounded and bonded as required by NEC (NFPA 70 Art. 504.50 and 504.60).
    e. IS systems must include identification as required by NEC (NFPA 70 Art. 504.80):

        1) Mark terminals in a manner to prevent unintentional interference with the circuits during testing and servicing.
        2) Clearly label wireways and enclosure components containing IS circuits as “Intrinsic Safety Wiring.”
        3) Color cabling and wireways using light blue as required by Section 406733 “Panel Wiring.”

D. Mounting Elevations

1. Refer to ISA Recommended Practice RP60.3 for guidance on layout and arrangement of panels and panel mount components. Account for housekeeping pad dimensions.
2. Locate centerline of indicators and controllers no lower than 48 inches or higher than 66 inches above the floor on a panel face.
3. Locate centerline of lights, selector switches, and pushbuttons no lower than 32 inches or higher than 70 inches above the floor on a panel face.
4. Locate tops of annunciators no higher than 86 inches above the floor on a panel face.
5. Install panel components in accordance with manufacturer's guidelines.

2.2 TEMPERATURE CONTROL

A. Provide force air ventilation or air conditioning units as required to prevent temperature buildup inside of panel.

B. Heat Load Calculations:

1. Submit heat load calculations for control panels located in areas where either venting is not possible due to NEMA rating of panel or control panel is located in an area or building without air conditioning.
2. Utilize manufacturer available thermal calculators to determine heating/cooling requirements (i.e. Saginaw SCE thermal calculator, nVent Hoffman cooling selection tool, or equivalent).
3. Ensure the internal temperature of the panel is regulated between 45 to 104 degrees F under conditions.
4. Account for the following conditions in the heat load calculations:

    a. Loading and dissipation effects on surfaces of the enclosure. Account for surfaces not available for heat transfer (e.g., against a wall).
    b. Internal heat load of components (load and duty cycle).
    c. For outside temperature limits, refer to Section 406100 "Process Control and Enterprise Management Systems General Provisions."

C. Sun Shields:

1. Provide custom fabricated sun shields for outdoor panels in accordance with the following requirements:

    a. Fabricate sun shields from a material suited for the area classification rating of its environment.
    b. Design, fabricate, install, and support the unit to fully cover and shade the top, sides, and back of the enclosure, and to partially shade the front panel of the enclosure from direct exposure to sunlight from sunrise to sunset.
    c. Depending on overall size, sun shields may be fabricated in single or multiple segments for attachment to the enclosure support framing or to separate free standing framing around the enclosure, to preserve rigidity.
    d. Design and mount sun shields with a minimum 3-inch air gap around the enclosure for air circulation and heat dissipation.

e. Drilling holes or welding studs directly to the enclosure for sun shield mounting is not permitted.
f. Slope the top section of the sun shield a minimum angle of 5 degrees from horizontal.

1) Wall mounted enclosures: slope the top section downward away from the wall and towards the front of the enclosure.
2) Free standing, floor mounted, and frame mounted enclosures: slope the top section downward towards the back side of the enclosure.

g. Incorporate a narrow and more steeply sloped drip shield segment on the front edge of the top section to shed water away from the front of the enclosure and prevent dripping or running directly onto the front panel of the enclosure.
h. Fabricate sun shields with continuous seam welds that are ground smooth.
i. Smooth round or chamfer exposed corners, edges, and projections to prevent injury.

D. Louvers

1. If louvers are used, provide louver plate and filter kit.
2. Provide louver plates of stamped sheet metal construction.
3. Provide washable and replaceable filters.
4. Install louvers on the rear, top, or bottom of the panel, as required by the panel installation location.
5. For wall mounted enclosures with their backs directly adjacent to a wall, install louvers on the sides.

E. Forced Air Ventilation:

1. Provide forced air ventilation fans to create positive internal pressure within the panel.
2. Provide washable and replaceable filters.
3. Fan motors operate on 120-volt, 60-Hz power.

F. Air Conditioning:

1. For panels with internal heat that cannot be adequately dissipated with natural convention and heat sinks, or forced air ventilation, provide an air conditioner sized to deliver sufficient cooling.
2. NEMA rating equivalent to the NEMA rating of the panel. Maintain NEMA rating of panel when installed.
3. Provide air conditioner with conformal coating on exposed surfaces.
4. Mount air conditioners on panel side. If provided, cut sun shields to accommodate air conditioner.

G. Heating:

1. Provide an integral heater, fan, and adjustable thermostat for outdoor enclosures and enclosures located in unheated areas indoors or in areas subject to humidity and moisture, to reduce condensation and maintain the minimum internal panel temperature.

a. Mount unit near enclosure bottom with discharge away from heat-sensitive equipment.
b. Provide Hoffman DAH series, Stego PTC series, or equal.

2.3 ACCESSORIES

A. Nameplates

1. Identify the panel and individual devices as required, unless otherwise indicated:

a. Include up to three lines:

1) First line containing the device tag number as shown on the Drawings.
2) Second line containing a functional description (e.g., Recirculation Pump No. 1).
3) Third line containing a functional control description (e.g., Start).

2. Unless escutcheon plates are specified or unless otherwise noted on the Drawings:

a. Furnish nameplates as 3/32-inch thick, black against white background unless otherwise noted, Lamicoid with engraved inscriptions. Bevel and smooth edges of nameplate.
b. Nameplates with chipped or rough edges are not acceptable.

3. Mount or fasten cabinet mounted nameplates with epoxy adhesive or stainless steel screws.
4. Provide a panel nameplate with a minimum of 1-inch high letters for every panel.
5. Provide legend plates or 1-inch by 3-inch engraved nameplates with 1/4-inch lettering for identification of door mounted control devices, pilot lights, and meters.
6. Use single Lamicoid nameplates with multiple legends for grouping of devices such as selector switches and pilot lights that relate to one function.

B. Print Storage Pockets

1. Provide print storage pockets of steel construction, welded onto the door of the enclosure.
2. Size storage pockets to accommodate prints required to service the equipment, and to accommodate 8.5-inch by 11-inch documents without folding.

C. Corrosion Control

1. Protect panels from internal corrosion by use of corrosion-inhibiting vapor capsules. Size and quantity as necessary per manufacturer recommendations.
2. Manufacturer:

a. Zerust VC.
b. Hoffman Model AHCI.
c. Or equal.

2.4 GENERAL FINISH REQUIREMENTS

A. Descale, degrease, fill, grind and finish sections.

B. Finish steel-fabricated enclosures with two rust resistant phosphate prime coats and two coats of enamel, polyurethane, or lacquer finish which are applied by either hot air spray or conventional cold spray methods.

1. Brushed anodized aluminum, stainless steel, and FRP panels do not require a paint finish.

C. Grind smooth, sandblast and then clean with solvent. Fill surface voids and grind smooth.

D. Immediately after cleaning, apply one coat of a rust-inhibiting primer inside and outside, followed by an exterior intermediate and topcoat of a two-component type epoxy enamel.

1. Apply final sanding to the intermediate exterior coat before top coating.

E. Apply a minimum of two coats of manufacturer's standard, flat light-colored lacquer, on the panel interior after priming.

F. Unless otherwise noted, finish exterior colors as ANSI 61 gray with textured finish.

G. Finish products after assembly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and rooms for suitable conditions where industrial enclosures will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Wiring Method: Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters. Conceal raceway and cables except in unfinished spaces.

1. Install plenum cable in environmental air spaces, including plenum ceilings.
2. Comply with requirements for Section 26053X "Sections for electrical raceways and covers."

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

3.3 ADJUSTING

A. Adjust hardware and moving parts to function smoothly and lubricate as recommended by manufacturer.

3.4 INDUSTRIAL ENCLOSURE SCHEDULE

A. Provide the following industrial enclosures:

Table 1. Industrial Enclosure Schedule

Panel Designation	Minimum Size	Maximum Size	Enclosure Rating	Construction	General Requirements
PLC-IPS Enclosure	72-inch high by 48-inch wide by 24-inch deep	90-inch high by 72-inch wide by 24-inch deep	NEMA Type 12	Type 12 Painted Carbon Steel	Free-standing, two-door, front-access only. Provide fold-down tray inside the cabinet
PLC-PCP-1 through PLC-PCP-6 Enclosures	72-inch high by 48-inch wide by 24-inch deep	72-inch high by 48-inch wide by 24-inch deep	NEMA Type 12	Type 12 Painted Carbon Steel	Free-standing, two-door, front-access only. Provide fold-down tray inside the cabinet
VTMP Enclosure	72-inch high by 36-inch wide by 24-inch deep	90-inch high by 72-inch wide by 24-inch deep	NEMA Type 12	Type 12 Painted Carbon Steel	Free-standing, singe or two-door, front-access only.

SECTION 406733 - PANEL WIRING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes requirements for internal wiring of control panels and consoles.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”
3. Section 406763 “Control Panel Mounted UPS.”
4. Section 407856 “Isolators, Intrinsic Safety Barriers, and Surge Suppressors.”

1.3 DEFINITIONS

A. American Wire Gage (AWG): Measurement of the cross-sectional area of a conductor.

B. Input/Output (I/O): Analog or digital field instrument signals to be received and interpreted by a PLC.

C. Programmable Logic Controller (PLC): A ruggedized programmable computer used for industrial automation.

D. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

1.4 ACTION SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.5 QUALITY ASSURANCE

A. Perform work in accordance with UL 508.

B. Provide components compatible with functions required to form complete working system.

© 2026 CDM Smith
All Rights Reserved

C. Provide UL 508 label on complete assembly.

D. Maintain one copy of panel drawings on site.

1.6 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 CONTROL PANEL - INTERNAL CONSTRUCTION

A. Internal Electrical Wiring:

1. Provide stranded, type MTW interconnecting wiring:

a. Use 600-volt insulation rated for not less than 90 degrees Celsius.
b. Segregate wiring for systems operating at voltages in excess of 120 VAC from other panel wiring.

1) Locate either in a separate section of a multi-section panel or behind a removable Plexiglas or similar dielectric barrier.

c. Develop panel layout such that technicians have complete access to 120 VAC and lower voltage wiring systems without direct exposure to higher voltages.

2. For power distribution wiring on the line side of fuses or breakers:

a. Use 12 AWG minimum.

3. For control wiring on the secondary side of fuses:

a. Use 16 AWG minimum.

4. Utilize 18 AWG shielded, twisted pair cable insulated for not less than 600 volts for electronic analog circuits.
5. Cover power distribution blocks with protective guards to meet “finger-safe” requirements of IP20.
6. Route power and low voltage DC wiring systems in separate wireways.

a. Cross different system wires at right angles.
b. Separate different system wires routed parallel to each other by at least 6-inches.
c. Terminate different wiring systems on separate terminal blocks.
d. Do not fill wiring troughs to more than 60 percent visible fill.
e. For wireways with intrinsically safe conductors, utilize light blue wireways.

7. Terminations:

a. Terminate wiring onto single tier terminal blocks:

1) Uniquely and sequentially number each terminal block.
2) Direct wiring between field equipment and panel components is not acceptable.
3) Multi-level terminal blocks or strips are not acceptable.

b. Arrange terminal blocks in vertical rows and separated into groups (power, AC control, DC signal).

1) Provide each group of terminal blocks with a minimum of 25 percent spares.

c. Use compression type, fused, unfused, or switched terminal blocks.

1) Use two terminals per point for discrete inputs and outputs (DI and DO) with adjacent terminal assignments.
2) Wire all active and spare PLC and controller points to terminal blocks.

d. Use three terminals per point for analog inputs and outputs (AI and AO) per shielded pair connection with adjacent terminal assignments for each point.

1) The third terminal is for shielded ground connection for cable pairs.

a) Ground the shielded signal cable at the PLC cabinet.
b) Wire all active and spare PLC and controller points to terminal blocks.

e. Use sleeve-type wire and tube markers with heat impressed letters and numbers.
f. Use only one side of a terminal block row for internal wiring.

1) Field wiring side of the terminal not to be within 6-inches of the side panel or adjacent terminal or within 8-inches of the bottom of free standing panels, or within 3-inches of stanchion mounted panels, or 3-inches of adjacent wireway.

g. Isolate circuit power from the SCADA cabinet to field devices (switches, dry contacts etc.) that are used as discrete inputs to the PLC input cards with an isolating switch terminal block with flip cover that is supplied with a dummy fuse.

1) Use Allen Bradley Model 1492-H7 or equal.
2) One isolating switch terminal block per loop numbered piece of equipment and one per spare I/O point is acceptable.

h. Isolate all PLC discrete outputs to the field with an isolating fuse switch terminal block with a flip cover and a neon blown fuse indicator.

1) Use Allen Bradley 1492-H4 or equal.

8. Clearly identify wiring to hand switches and other devices, which are live circuits independent of the panel's normal circuit breaker protection as such.
9. Clearly tag and color code wiring.

a. Tag numbers and color coding to correspond to panel wiring diagrams and loop drawings prepared by the PCSS.
b. Power wiring, control wiring, grounding, and DC wiring to utilize different color insulation for each wiring system used.
c. Intrinsically safe wiring to utilize light blue cabling. No other conductors can utilize light blue cabling.
d. Color coding scheme to be in accordance with UL 508a.

10. Provide surge protectors on all incoming power supply lines at each panel per requirements of Section 407856 “Isolators, Intrinsic Safety Barriers, and Surge Suppressors.”
11. Each field instrument furnished under Division 40 and shown on the Drawings as deriving input power from the control panel(s) to have a separate power distribution circuit with a circuit breaker or fuse and blown fuse indication.

    a. Power instruments requiring 120VAC power as shown on the Drawings.

12. Wiring trough for supporting internal wiring:

    a. Plastic type with snap-on covers.
    b. Side walls to be open top type to permit wire changing without disconnecting.
    c. Trough to be supported to the subpanel by stainless steel screws.
    d. Do not bond trough to the panel with glue or adhesives.

13. Provide each panel with a single tube, LED light fixture, 20 Watt in size (minimum).

    a. Mounted internally to the ceiling of the panel.
    b. Light fixture to be switched and be complete with the lamp.

14. Each panel to have a specification grade duplex convenience receptacle with ground fault interrupter:

    a. Mount internally within a stamped steel device box with appropriate cover.
    b. Convenience receptacle is not to be powered from a UPS.
    c. Protect by a dedicated fuse or circuit breaker.

15. Each panel to be provided with an isolated copper grounding bus for all signal and shield ground connections.

    a. Shield grounding to be in accordance with the instrumentation manufacturer's recommendations.

16. Provide each panel with a separate copper power grounding bus (safety) in accordance with the requirements of the National Electrical Code.
17. Each panel to have control, signal, and communication line surge suppression in accordance with Section 407856 “Isolators, Intrinsic Safety Barriers, and Surge Suppressors.”
18. Microprocessor-based electronic devices in the panel that are powered by 120VAC to be powered by the UPS.
19. Provide each panel with a circuit breaker to interrupt incoming power.

20. Additional electrical components including transformers, motor starters, switches, circuit breakers, etc. to be in compliance with the requirements of Division 26.

B. Relays not provided under Division 26 and required for properly completing the control function specified in Division 40, Division 26 or shown on the Drawings to be provided under this Section.

C. Orientation of devices including PLC and I/O when installed to be per the manufacturer's recommendations.

1. No vertical orientation of PLC racks are allowed unless specifically indicated by the manufacturer as an acceptable mounting alternative and also approved by the Engineer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.2 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

SECTION 406763 - CONTROL PANEL MOUNTED UPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes control panel mounted uninterruptible power supplies (UPS).

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”

1.3 DEFINITIONS

A. Uninterruptible Power Supply (UPS): A device capable of providing emergency battery power when the main power source fails.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions”.

B. Shop Drawings:

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions”.

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. None Required.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 TECHNOLOGY OBSOLESCENCE MITIGATION

A. Due to rapidly evolving technology of the equipment specified herein, the requirements specified are to establish a baseline for the type of equipment required. Provide the current version of hardware and software of similar specification at the time of purchase equivalent in cost to that which is specified. The procedure for submitting and releasing the equipment is as follows:

1. PCSS to submit for approval the required data for the equipment as part of the Hardware Packages Submittal.
2. Order equipment as late as possible dependent on the construction schedule to ensure the latest equipment available is provided. Just prior to ordering, resubmit for approval the required data of the latest available hardware and software equivalent in cost to that which is specified. Do not order equipment more than 3 months prior to when it is needed to be continuously used on the project.

1.10 DELIVERY, STORAGE, AND HANDLING

A. As indicated by the Manufacturer.

1.11 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.12 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

© 2026 CDM Smith
All Rights Reserved

PART 2 - PRODUCTS

2.1 SINGLE PHASE UPS

A. Manufacturers

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Eaton-Smart Online, 9PX
b. APC-Smart UPS .
c. Substitutions: Or equal

B. System Description:

1. Provide an industrially rated continuous duty, on-line double conversion, single-phase uninterruptible power system.
2. UPS to provide power conditioning and power backup for PLC, communications hardware, and other critical electronic loads as indicated on Drawings.
3. UPS system consists of the following major components:

a. Rectifier and battery charger.
b. Inverter.
c. Batteries.
d. Other features as described in this Section and as indicated on Drawings.

C. General Requirements:

1. Provide battery protection via an internal circuit breaker disconnect.
2. Current limiting circuitry to protect inverter output under any load condition.
3. AC output neutral be electrically isolated from UPS chassis.

a. UPS chassis to have an equipment ground terminal.
b. Provide provisions for installation of a bonding connector.

4. Suitable for installation in a UL508A listed panel or rack or console. Refer to the schedule in PART 3 for form factor and installed enclosure type.
5. Mounting: Refer to the schedule in PART 3 for mounting type.
6. UL recognized components for industrial applications in accordance with UL508 without derating.

D. Performance Requirements:

1. Ratings:

a. Output power: As shown in the schedule in PART 3.
b. Battery runtime: 14 minutes at full-load, 34 minutes at half-load.

2. Environment:

a. Ambient temperature: 0 to 104 degrees F.

b. Elevation: Up to 500-ft above mean sea level.
c. Relative humidity: 1 to 95 percent non-condensing.

3. System Input - Primary source:

a. Nominal Input Voltage: As shown in the schedule in PART 3.
b. Frequency: 45 to 65 Hz.
c. Input Power Factor: 0.95 lag minimum, 50 to 100 percent load.
d. Input Surge Withstandability: Per IEEE 587/ANSI C62.41. Category A and B, (6 kV).

4. System Output:

a. Nominal Output Voltage: As shown in the schedule in PART 3.
b. Frequency: 60 Hertz plus or minus 3 Hertz.
c. 100 percent load with 3:1 Crest Ratio.
d. Frequency Slew Rate: 1 Hz/second. (Adjustable at startup)

5. AC to AC Efficiency (100 percent load @ rated PF): 88 percent online, 86 percent on battery.
6. Acoustical Noise:

a. Noise generated by UPS under normal operation shall not exceed 65 dBA (60 dBA typical) at one meter from any surface, measured at 77 degrees F and full load.

7. EMI Suppression:

a. UPS to meet FCC Rules and Regulation 47, Part 15, Subpart J, for Class A devices.

E. Modes of Operation:

1. UPS to operate as a line interactive on-line, fully automatic system in the following modes:

a. Normal:

1) Critical load continuously supplied with filtered and regulated AC power by inverter. Rectifier/battery chargers derive power from preferred AC source and supply DC power to inverter while simultaneously floats charge the batteries.

b. Emergency:

1) Upon failure of preferred AC power source, critical load continues to be supplied by inverter. Inverter power supplied without switching from storage battery. No interruption to critical load upon failure or restoration of preferred AC sources. If AC source cannot be restored before battery discharges to its low voltage dropout value, UPS automatically shuts itself down in an orderly manner.

c. Recharge:

1) Upon restoration of AC source, rectifier/battery charger to power inverter and simultaneously recharge batteries. This to be an automatic function causing no interruption to critical load.

F. Rectifier/Charger:

1. Solid-state equipment and controls necessary to convert incoming AC power to regulated DC power for input to inverter and for battery charging.
2. Solid-state SCR/IGBT power transistor type with constant voltage/current limiting control circuitry.

G. Inverter:

1. Include all solid-state equipment and controls to convert DC power from rectifier/charger or battery to a regulated AC power for powering critical load.

a. Use Insulated Gate Bipolar Transistors (IGBTs) in a phase-controlled, pulse width modulated (PWM) design capable of providing the specified AC output.

2. Capable of supplying current and voltage for overloads exceeding 100 percent.

a. Provide 150 percent of full load for 30 seconds and 125 percent of full load for 2 minutes.
b. Status indicator and audible alarm indicate overload operation.

3. Maintain output voltage to within plus or minus 5 percent.
4. Output voltage total harmonic distortion (THD) not greater than 5 percent at full load.

H. Batteries:

1. High Temperature sealed, maintenance-free, high-rate discharge, lead-acid cells suitable for use indoors with no off gassing, or water addition requirements.

a. Require no special ventilation.
b. One or more battery banks with number of cells required to meet requirements of rest of these specifications.

2. Battery Design Life: 2 to 4 years

I. Controls and Monitoring:

1. Microprocessor-controlled circuitry:

a. Provide fully automatic operation of UPS through use of a microprocessor-based controller.
b. Operating and protection parameters firmware controlled.
c. Logic includes system test capability to facilitate maintenance and troubleshooting.
d. Startup, battery charging, and transfers to be automatic.

2. Front Indicators: As a minimum, the following indicators to be provided on UPS control panel:

   a. On-line (UPS is using utility power to power the load).

      1) In bypass mode.
      2) On battery.
      3) Overload.
      4) Replace battery / battery disconnected.
      5) Fault.
      6) Bar graph for utility voltage.
      7) Bar graph for battery.

   b. Front Panel UPS Controls:

      1) Power On/Off.
      2) Self-test.
      3) Alarm silence.
      4) Cold start.
      5) Load off.

   c. Remote alarm and status indication: Isolated SPDT dry contacts provided to indicate UPS status for remote monitoring. Contacts rated for 250VAC @ 5A or 30VDC @ 5A

      1) Individual contacts provide for separate annunciation of the following alarm and status conditions:

         a) Low Battery
         b) On UPS power
         c) Malfunction
         d) In maintenance bypass

J. External Maintenance Bypass Switch:

1. Provide each UPS with a "two-position" external bypass switch system to permit UPS to be removed for repair or maintenance without causing power disruption to connected power loads.

   a. External bypass switch: snap-action type with switching speed approximately 10ms or less independent of operator action.
   b. Label the two positions UPS and UTILITY.

2. For UPS units up to and including 3KVA:

   a. Furnish an Electroswitch series 103 snap action switch or equivalent,
   b. Furnish custom plugs, receptacles, and appropriate wiring to achieve the specified functionality.

3. For UPS units above 3 KVA:

a. Furnish standard manufacturer's maintenance bypass switch unless a dry contact for remote monitoring is specified herein to monitor the switch and it is not offered by the manufacturer.
b. Otherwise, provide an Electroswitch series 103 switch or equivalent, along with:

1) Custom plugs, receptacles, and appropriate wiring to achieve the specified functionality.

4. Provide a dry contact to indicate when bypass switch is in "Maintenance" position.

a. Contact rated for 250VAC @ 5A or 30VDC @ 5A.

PART 3 - EXECUTION

3.1 UNINTERRUPTIBLE POWER SUPPLY SCHEDULE

A. Provide the following uninterruptible power supplies. Exact sizing of the UPS is the responsibility of the PCSS.

Table 1. Uninterruptible Power Supply Schedule

UPS Designation	Minimum VA	Input Voltage	Output Voltage	Location, Type, and Notes
UPS-IPS	1500 VA	120 VAC	120 VAC	PLC-IPS Enclosure. Tower style UPS.
UPS-PCP-1 through UPS-PCP-6	1500 VA	120 VAC	120 VAC	Respective PCP Enclosure. Tower style UPS.

3.2 EXAMINATION

A. Examine walls, floors, roofs, and rooms for suitable conditions where UPS will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method:

1. Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures:

1. Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.4 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.5 IDENTIFICATION

A. Refer to control system architecture for tagging designations

3.6 FIELD QUALITY CONTROL

A. Uninterruptible power supplies will be considered defective if tests and inspections are not passed satisfactorily.

B. Prepare test and inspection reports in accordance with the following:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 406121. 20 “Process Control System Testing.”

3.7 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION 406763

SECTION 406863 - CONFIGURATION OF HMI SOFTWARE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. If referred to anywhere else in the project manual, AE or AESS services include, but are not limited to, those services specified in this Section.

B. Provide all programming, configuration, and related services required to achieve a fully integrated and operational system. Control of all equipment to be in conformity with the Contract Drawings, process control descriptions, specifications, engineering data, instructions, and recommendations of the equipment manufacturer. Coordinate the control system for proper operation with related equipment and materials furnished by other suppliers under other Sections of these specifications and with related existing equipment. Include the following information:

1. Configuration of the HMI System Software, Operator Interface Terminals, and drivers provided for all equipment shown on the drawings, including equipment provided by vendor package systems.

    a. Include configuration updates of the existing PLC-ECR OIT screen displays adding the functionality of the new pumping system.

2. Configuration of any alarm dialer provided.
3. Configuration of the SCADA Historian Software.
4. Configuration of system reports using the Reporting Software provided.
5. Communications and functionality data between all connected devices (such as PLCs) and the HMI software packages, including devices supplied by others, as depicted on the system architecture drawings in order to provide a comprehensive working system of data collection, storage and reporting.

C. Coordinate all work with plant operating personnel to minimize impacts on daily operation. Note delays caused for any reason and formally submit to the Engineer and the Owner in the form of a letter.

D. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406126 “Process Control System Training.”
3. Section 406196 “Process Control Descriptions.”
4. Section 406263 “Operator Interface Terminals”

5. Section 406343 “Programmable Logic Controllers.”
6. Section 406866 “Configuration of Controller Software.”

1.3 DEFINITIONS

A. Applications Engineering System Supplier (AESS): The entity who provides all programming, configuration, and related services for the control system equipment provided by the PCSS.

B. Human Machine Interface (HMI): A software-based user interface with supervisory level control and of machine level equipment.

C. Input/Output (I/O): Analog or digital field instrument signals to be received and interpreted by a PLC.

D. Operator Interface Terminal (OIT): A hardware component of the HMI used for device level control and monitoring.

E. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

F. Programmable Logic Controller (PLC): A ruggedized programmable computer used for industrial automation.

1.4 PREINSTALLATION MEETINGS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.” The meetings below are in addition to the meetings specified in that section.

B. Schedule and conduct a Standards and Conventions workshop. The purpose of this workshop is to review the standards, conventions, and methodologies that will be used to program and develop the programs (i.e., HMI and PLC databases, HMI graphics, and PLC programming, etc.) and will solicit Engineer and Owner's input. Submit an agenda with examples for items to be discussed at client workshop.

C. Schedule and conduct a draft graphics review meeting. The purpose of this meeting is to present draft graphics for the Owner's and Engineer's review and feedback prior to creating the full set of graphics for review. For repetitive graphics such as graphics for multiple process trains, include an example of the first graphic only for discussion. Include discussion of process and overview displays, examples of pop-ups, trends, and system navigation tools. Expect major comments and incorporate any changes resulting from those comments.

D. Schedule and conduct a second graphics review meeting. The purpose of this meeting is to finalize the process of building the required HMI system. This meeting will be held after return of the draft graphics submittal and incorporation of comments. At this meeting, present the actual software displays, databases, security system, reports, and the like. The Owner will make comments on the system for incorporation prior to factory test. Bring a working system to allow for live demonstration of graphics.

E. Schedule and conduct a Historical Data Management and Reports workshop. The purpose of this workshop is to discuss and solicit Engineer/Owner input for storage and management of historical data; format of daily, monthly, and yearly reports; development of data entry templates; report formats and layouts; and user interface displays for accessing and generating reports. Bring examples of these documents for review and discussion.

F. Schedule and conduct a factory-testing coordination meeting, two weeks prior to factory testing. The purpose of this meeting is to discuss the specifics of proposed tests and provide a forum for coordinating required factory testing.

G. Schedule and conduct a field-testing coordination meeting, two weeks prior to field testing. The purpose of this meeting is to discuss specifics of proposed tests and provide a forum for coordinating required field-testing.

1.5 ACTION SUBMITTALS

A. Provide the submittals listed below at a minimum:

1. System Standards and Conventions.
2. Operator Interface.
3. Controller Program.
4. Reports.
5. Historical Data Management.

B. System Standards and Conventions Submittal:

1. Following the Standards and Conventions workshop, submit standards and conventions to be used on this project. Define the submittal, at a minimum:

   a. Graphic display standards, including color conventions, equipment symbols, display format, equipment control pop-up displays, trend displays, and display navigation. Include samples of each proposed type of graphic display (i.e., overview, detail, diagnostic, tabular, etc.).
   b. System naming conventions, such as graphic displays naming, database naming, tag names, and computer naming.
   c. System configuration, including network addressing and PLC/RTU addressing.
   d. Alarm configuration standards, including priorities and logging.
   e. Security configuration standards, including user groups and privileges.
   f. PLC/RTU standard programming modules, including analog input scaling, flow totalization, equipment runtime, motor start/stop, valve open/close, and any other standard logic planned to be used.

2. To facilitate the Owner's future operation and maintenance, use the submitted standards and conventions as basis for programming and configuration of the system. Do not begin the system programming and configuration prior to the System Standards and Conventions Submittal.

C. Operator Interface:

1. Following the approval of the standards and conventions submittal, submit a draft of all proposed graphic displays, examples of each type of pop-up (faceplate) displays, and examples of trends. For those graphics, which will be duplicated more than once for similar type of equipment, submit graphics for the first equipment only.
2. Following the draft graphics review meeting and prior to the factory test, submit a ready-for testing version of all graphic displays. These graphics should be completely finished other than the incorporation of comments and changes resulting from testing.
3. Submitted graphic displays and trends are to be no less than 8.5 inches by 11 inches and in full color.

D. Historical Data Management:

1. Following the Historical Data Management and Reports workshop, submit all aspects of the historical data management system and include as a minimum the following:

    a. A complete listing of all signals to be collected and stored, including data sampling rate and duration for which the data will be immediately accessible.
    b. Data reduction methods, rates, and the duration data will be immediately accessible.
    c. Storage space requirements and supporting calculations.
    d. Historical database design description, including data flow diagram, table definitions, procedures and queries used; and description of method of accumulating and displaying run times and flow totals. Define the method of interfacing to the reporting system, methods of handling Data Quality Flags, and methods of storing and displaying trending information.
    e. Description of methodology for restoring data collected locally during times when the historical data management system is not available. Description of database failure and recovery, including data correction.
    f. Description of selecting only the active real-time data source for systems that are utilizing redundant data acquisition nodes.
    g. List of data source interfaces to be used with the system (for example, OPC, file collection, historian-historian collector, HMI applications, etc.)

E. Reports:

1. Following the Historical Data Management and Reports workshop, submit all aspects of the reports generation system and include as a minimum the following:

    a. A complete list of all reports to be developed.
    b. Complete listing of all signals to be reported, including calculated values.
    c. Description of reporting data storage design, including method data is polled and stored.
    d. Description of methodology for entering manual data and interfaced used.
    e. Procedures for recall, generation and printing of reports
    f. Printout of each report to be provided with details of each cell, where data comes from, and calculation of raw data.

© 2026 CDM Smith
All Rights Reserved

1.6 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.7 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 GENERAL

A. The system specified performs the following generalized functions:

1. Allows the operator to control equipment such as pumps and valves as shown on the Drawings and as defined in Section 406196 “Process Control Descriptions.”
2. Perform real-time process control, including proportional integral derivative control action, sequencing, and process calculations.
3. Collect, calculate, and store accurate, reliable operating information for present and future uses.
4. Assist remote site operating personnel by noting and communicating of normal operating conditions and equipment failures.
5. Accumulate and store equipment running times for use in preventative maintenance.
6. Provide color graphic displays and reports for use by the system operating and supervisory personnel.
7. Provide trending for analog values.
8. Provide control system diagnostics.
9. Perform process control functions including PID, calculations, sequencing, timing, in the process controller. The HMI software performs the real-time database, report generation, graphic screens, program development, set point modification, data archiving, etc.
10. Allow the operator to manually control (by keyboard entry and mouse type pointing device) the status of pumps, valves, e.g., on/off, open/close, setpoint value,) when viewing the appropriate graphic screen on the HMI.

3.2 GRAPHIC DISPLAYS - GENERAL

A. Comply with Section 5 of the Nassau County SCADA System Standards unless otherwise noted or specified.

B. Ensure displays contain and continuously update the displayed process variables, date and time of day, with process values showing in engineering units. Incorporate on displays:

1. References to both instrumentation tag numbers and plant equipment numbers.

2. Process variables on their associated display(s) with correct engineering units.
3. Process variables with their associated data quality flags.

C. Operator commands related to controlling field devices or system attributes require multiple keystrokes or mouse actions to protect against inadvertent operations. Confirmation to the operator for the selected point to be controlled is provided, at which time a cancellation of the control can be affected.

D. Process graphic displays are depicted from the P&ID's, site plan drawings, mechanical drawings and electrical drawings included in these Contract Documents. The graphic displays include process flow streams, process structures, and all major items of process equipment and control devices in a schematic format.

E. Include on main graphical screens a title bar, main graphic area, navigational buttons, and alarm summary bar.

1. Title bar displayed on the top of each screen and include display name, description and time/date.
2. Main graphical area contains primary screen data in graphical format.
3. Navigational buttons include a minimum of main menu, trends, main alarm summary, and security log in.
4. Alarm summary bar displays the last three valid alarms on the bottom of each screen.

F. Provide animation to mimic level changes in tanks or vessels, and to mimic rotation of rotating equipment when running. Valve colors to change when opened and closed.

G. Adjust from the operator interface timers, setpoints, alarm actuation levels, unless specifically noted.

H. Ensure the system show field conditions with text that can alternate (i.e., OPEN/CLOSE, START/STOP, HIGH/LOW) and change color correspondingly. Field devices that are tri-state must be represented in three conditions.

I. Ensure conditions in the field designated as alarm conditions report to the operator workstation, actuate an audible alarm, and provide a visual blinking image on the associated graphic page. Display alarms and events on the screen and archived.

J. Identify interlocks that affect equipment operation both by alarm and by HMI indication.

K. Check analog inputs for out of range (via high and low limit checks) and alarmed.

L. Label process flow streams and color-code using the project color schedule in Division 09. Identify structures and equipment by name and appropriate equipment and loop tags.

M. Color coding for equipment status and alarms is as follows:

1. Red for on or open.
2. Green for off or closed.
3. Active, unacknowledged alarms are indicated by flashing amber.
4. Active, acknowledged alarms are indicated solid amber.

N. Automatically record alarm and events should any of the following sequences or events occur:

1. Date/Time entry.
2. Limit changes.
3. Commanded or un-commanded change of any point.
4. Alarm conditions.
5. PLC activation or deactivation.
6. Operator login or logout activity.

O. There may be additional general programming requirements listed in PART 1 of Section 406196 “Process Control Descriptions” that impact the HMI configuration.

3.3 SPECIFIC GRAPHIC SCREENS

A. At a minimum, provide the following types of graphic screen indicated below.

1. Plant Overview screen including a site plan representation, indicating the geographic location of each process and building.
2. Main menu screen linking all screens and process areas; complete and logical listing names and number of all screens.
3. Overall plant process block flow diagram screen showing major processes in block form with flow arrows. Each block includes a text description of key individual treatment processes. Navigational buttons to the individual treatment processes can be performed by pressing on the text description.
4. Individual treatment process screens graphically screening key process variables and equipment. Features:

    a. No operator entries are available from these screens.
    b. Individual process flow screens for each process include all process components, including tanks, pumps, blowers, mixers, drives, flow meters, valves, mechanical devices, as well as manual shutoff and isolation valves.
    c. These diagrams are generally depicted from the P&ID's with at least 1 screen per P&ID on average.

5. Individual unit process screens depicted from the P&ID's are used for control and screen of each major item of process equipment, process variables, and control devices, including pumps, blowers, valves, gates, mixers, and drives. Navigational buttons consist of the P&ID's flow arrows to other individual unit processes. The unit process screens provide the ability for the operator to go to individual equipment popup screens. These diagrams are generally depicted from the P&ID's with at least 2 screens per P&ID on average.
6. Provide popup screens for each piece of equipment to start/stop equipment, open / close valves, implement automatic control, adjust set points, establish and adjust tuning parameters, set alarm limits and initiate a sequence.
7. PLC system diagnostic screens, showing the operational status, and fault conditions of all PLC components, including processors, I/O modules, OIT's, power supplies and UPS units.
8. Communications diagnostic screens, showing the details of network status, communications status of all major components including Operator Work Stations, peripheral devices and network components.

9. Maintenance screens display the raw value for each analog and digital I/O point in the system. They allow the operators/maintenance personnel to enter an override value for an analog point that is then used by the system instead of the value read from the input card / communications link.
10. Trend screens with the capability to screen up to eight, operator assigned, analog and/or digital process variables. Each analog value will be shown on a trend screen.
11. Main alarm summary screen includes the following information for each alarm: Time, tag name, description, alarm type, current value and status. An acknowledge alarm button acknowledges all new unacknowledged alarms. Display alarms in the alarm summary screen and in the alarm banner as follows:

    a. Unacknowledged and active alarm: Displayed on screen, blinking
    b. Acknowledged and active alarm: Displayed on screen, not blinking.
    c. Unacknowledged and inactive alarm: Displayed on screen, blinking. Text/background of the alarm displayed in a different color than active alarms.
    d. Acknowledged and inactive alarm: Not displayed in banner.

12. Analog variable screens showing a tabular summary of all plant process variables, in operator assigned groupings.

3.4 SECURITY

A. Configure and implement the system with security to prevent unauthorized access. The system allows authorized changes to system operation through defined user accounts and password verification.

B. Coordinate with Owner user account information, including login name and password for each account.

C. Assign security levels of "display only," "operator mode," "supervisor mode," and "engineer mode" through assignable passwords. On system startup, automatically enter the "display only" security level. In the "display only" mode, information is available to be displayed on the screen, but no changes may be made. In the "operator mode," changes may be made to process set points, times, etc.; however, the overall control concepts may not be modified. In the "supervisor mode," all operator functions can be modified, and any special reports or critical process set points (data can be modified; however, the overall control concepts may not be modified). In the "engineer mode" level, all user modifiable parameters of the system are available for modification.

3.5 ALARM/EQUIPMENT STATUS REPORTING

A. Display on the alarm log all alarms as they occur. Include on the alarm message the time of occurrence, tag name, tag number, and whether it is a low, high, or failure alarm. When the point in alarm returns to normal, the time, point identification number, and return to normal are displayed. Include on all reports the plant equipment number of the associated device.

B. Log the equipment status whenever a change in status occurs (i.e., start, stop). Include on the equipment status log the time, equipment name, tag number, and the particular change in status.

© 2026 CDM Smith
All Rights Reserved

3.6 HISTORICAL DATA MANAGEMENT

A. Provide the following features for processing and storage of system historical data:

1. Each system point (analog or digital, real or pseudo) has the capability of being historically logged. A point can be deleted from historical log at any time. Points can be added or deleted from the system using minimal keystrokes.
2. Sample and store all process analogs and all flow totals and run time indications of all primary process equipment motors in the historical data management system.
3. Data Processing: Store the real time instantaneous values in a historical log file on the hard disk at defined sampling rates.
4. Data Correction: Manually modify historical data by personnel with appropriate security levels. Differentiate such data from actual monitored values on reports, in the database and in trends.
5. Data Quality: Propagate data Quality flags to the next higher level of the history based on user selectable percentage determining tolerance levels for averages and totals. If the percentage of suspect data exceeds the tolerance level, the suspect data flag propagates to the next higher level. Maximums and minimums are taken from good data.
6. Manual Input Data Handling: This data consists of additional values not obtainable by the system such as laboratory analysis for use in reports. Enter and store all manually entered data in the appropriate engineering units. Display all data entered for confirmation on the display prior to incorporation to the database.

3.7 REPORTS

A. The system generates reports from on-line historical data files or prompt the user for the appropriate archived data files.

B. Initiate reports automatically based upon time of day or manually upon operator’s request.

C. Develop user-interface displays for report generation with easy recall of reports by entering time:day:year target values.

D. User interface displays allows the operator to define the destination of the report (e.g., display, printer, computer file, etc.) and when to print (e.g., immediately, on demand, or automatically at a specified time).

E. Print quality tags alongside the value.

F. Identify values for which there are no data with a special character. Thus, print only values which are actually zero.

G. Operational Report Types. Provide the following operational report types with the system:

1. Shift Operation Summary Report:

a. Summarize plant operation from the start and finish time of operation on an operator-adjustable time interval shift operation report.
b. Consist of the following: correct date, plant name, report name, page number, group headings, subheadings, point identification, and engineering units.

2. Daily Operation Summary Report

   a. Summarize plant operation for the previous day on the daily operation report. Printed information is stored values (not averages) including scanned, lab, and manually entered data.
   b. The report format consists of the following: correct date, plant name, report name, page number, group headings, subheadings, point identifications, and engineering units.
   c. Also calculate the daily minimum, average, maximum, and total where applicable and print and store for each point.

3. Monthly Operation Summary Report:

   a. Summarize plant operation for the previous calendar month on the monthly operation summary report.
   b. Arrange the report format so that the first several pages conform to the requirements of the state regulatory agencies and separate from the rest of the monthly operation report for transmittal to the regulatory agency.
   c. Report format similar to the daily operation summary report, consisting of the following: month and year, plant name, report name, page number, group headings, sub-headings, point identifications, and engineering units.
   d. Print monthly minimum, average, maximum, and totals, where applicable, for each column of points printed.

4. Annual Operation Summary Report:

   a. Summarize plant operation for the previous calendar year on the annual operation summary report. Report consists of scanned data, lab data, and manually entered data.
   b. Format of the report is identical with the monthly operation summary report except for replacing month with year in the heading and replacing date with calendar month.

3.8 TESTING

A. Refer to Section 406121.20 “Process Control System Testing”.

B. Supplement to Field Testing requirements

1. Prior to leaving the site, use the Owner's programming computer to monitor all PLC processors online, make on-line changes, upload and download the processor to ensure programming software version compatibility.
2. Loop Tuning – Tune all PID control loops (single or cascade) following device installation but prior to commencement of the Functional Demonstration Test.

   a. Achieve optimal loop tuning either by auto-tuning software or manually by trial and error, Ziegler-Nichols’ step-response method, or other documented process tuning method.
   b. Determine and configure optimal tuning parameters to assure stable, steady state operation of final control elements running under the control PID. Adjust each

control loop that includes anti-reset windup features to provide optimum response following startup from an integral action saturation condition.

c. Tune all PID control loops to eliminate excessive oscillating final control elements. Adjust loop parameters to achieve a decay ratio of 1/4 or better. In addition, achieve loop steady state at least as fast as the loop response time associated with critical damping.

d. Verify loop performance and stability by step changes to setpoint in the field.

e. Submit loop tuning documentation as specified in Part 1 of this Section.

3.9 TRAINING

A. Refer to Section 406126 “Process Control System Training” for general training requirements.

B. Furnish training as shown in the table below.

Description	Minimum Course Duration (hours)	Maximum Number of Trainees per Course	Number of Times Course to be Given	Intended Audience
Onsite Training				
Control System Overview Seminar	2	12	1	Management
Operator Training (Pre start-up)	8	12	1	Operations
Operator Training (Post start-up)	8	12	1	Operations
Software Maintenance	2	2	1	Maintenance
System Reports and Historian	2	2	1	Maintenance

C. Control System Overview Seminar:

1. Provide Control System Overview seminar for the Owner's personnel at the Owner's facility. The objective of this seminar is to provide personnel with an overview understanding of the Control System. Target the seminar material to the Owner's management, engineering, and other non-operations personnel. The seminar includes, but not limited to, the following:

   a. An overview of the Control system explaining how the hardware and software supplied under this Contract is used for the operation and control of the facilities.

   b. A block diagram presentation of the Control system showing how and what information flow within the system and what each functional unit does.

   c. An explanation of the operator interfaces including a demonstration of how to use an operator's workstation to monitor, control, navigate, display trends, and all other operational features of the system. Address outside of this course a discussion of process control of individual processes.

   d. A walkthrough of the installed system explaining each of the items covered in the functional units' discussion. Discuss the features and functions of operator controls and interfaces.

D. Operator Control System Training (pre- or post-startup):

1. Cover during operator training plant operation with the control system and use of the HMI display screens, including at a minimum all the following items:

    a. Basics of HMI control and navigation.
    b. Alarming and Interlocks.
    c. Auto functionality of automated processes and HMI control.
    d. Failure modes of equipment and operator responses.

2. Hold a minimum of two operator-training sessions (Pre-Startup) for operators one week before system startup. Use the Simulator specified in this project for the pre-startup training. Hold additional one or two operator-training sessions (Post-Startup) for operators one week after system startup.
3. Hold operator training at the convenience of the Owner. Hold this training during the day, late at night, or very early in the morning to accommodate the Owner's shift schedule.
4. Operator training is introductory in nature during pre-startup training and more in-depth and detailed during post-startup training.
5. At a minimum, provide the following teaching aids for distribution during Operator training sessions:

    a. Preliminary O&M Manuals (pre-startup); Final O&M Manuals (post-startup).
    b. P&IDs.
    c. Daily syllabus.

6. Fifty percent of the Operator training is "hands on" utilizing the installed Control System to the fullest extent possible. Confirm the operability of the Control System before commencing training. Training performed using a non-functioning Control System is not permitted.

E. Software Maintenance:

1. Provide training of how to back-up PLCs, HMIs, OITs, and any other software in this system.
2. Provide training on all aspects covered in the O&M Software Maintenance Manuals.
3. Provide training on PLC program structure, HMI configuration structure, tips in how to edit programming code, and other items which will supplement the maintenance staff's ability to edit and maintain the programs.

F. Historian and System Reports:

1. Provide training of how to run the reports, how to manually enter data, and how to print and reprint the reports.
2. Provide training on how to execute data queries that are outside of those defined in the reports.
3. Provide training on Historian configuration, report configuration, database maintenance and backup, and repair of failed reports.

SECTION 406866 - CONFIGURATION OF CONTROLLER SOFTWARE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. If referred to anywhere else in the project manual, AE or AESS services include, but are not limited to, those services specified in this Section.

B. Provide all programming, configuration, and related services required to achieve a fully integrated and operational system. Control all equipment in full conformity with the Contract Drawings, process control descriptions, specifications, engineering data, instructions, and recommendations of the equipment manufacturer. Coordinate the control system for proper operation with related equipment and materials furnished by other suppliers under other Sections of these specifications and with related existing equipment.

1. Provide configuration of the PLC provided for all equipment shown on the drawings, except for controls equipment shown being provided as part of a vendor package system.

C. Coordinate all work with plant operating personnel to minimize impacts on daily operation. Note delays caused for any reason and formally submit to the Engineer and the Owner in the form of a letter.

D. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406196 “Process Control Descriptions.”
3. Section 406263 “Operator Interface Terminals”
4. Section 406343 “Programmable Logic Controllers.”
5. Section 406863 “Configuration of HMI Software.”

1.3 DEFINITIONS

A. Applications Engineering System Supplier (AESS): The entity who provides all programming, configuration, and related services for the control system equipment provided by the PCSS.

B. Human Machine Interface (HMI): A software-based user interface with supervisory level control of machine level equipment.

C. Input/Output (I/O): Analog or digital field instrument signals to be received and interpreted by a PLC.

D. Operator Interface Terminal (OIT): A hardware component of the HMI used for device level control and monitoring.

E. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

F. Programmable Logic Controller (PLC): A ruggedized programmable computer used for industrial automation.

1.4 PREINSTALLATION MEETINGS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.” The meetings below are in addition to the meetings specified in that section.

B. Refer to Section 406863 “Configuration of HMI Software” for requirements of the standards and conventions workshop.

1.5 ACTION SUBMITTALS

A. Controller Program Submittal:

1. For each controller, submit the following using the controller manufacturer's built-in printing functions. Electronic submission of Adobe Portable Document Format ("pdf") files in lieu of paper submittals is acceptable. Review will be for general program organization, level of documentation, and overall programming standards (basic pump and valve control, for example). The review will not attempt to confirm the logic works correctly for every loop.

    a. PLC programs showing ladder logic, function block, high level language or another controller language used. Include individual rung, network, and/or command descriptions with abundant comments to clearly identify function and intent of each code segment. Clearly present each logic segment, describe the function of each timer, label and define the purpose of each subroutine call, etc. Ensure that program documentation is sufficiently clear to allow determination of compliance with the process control requirements included in the control descriptions and with the Drawings. The submittal demonstrates that all logic provided under this project follows the same structure and format and reflects a common programming approach.
    b. Submit a memory usage report for the controller. Indicate total memory capacity and unused memory capacity.
    c. Submit cross reference index of I/O allocation and controller memory address. Include every physical I/O point as well calculated or virtual I/O required for the implementation of the process scheme.

2. Submit details of control system communication. Submit a "memory map" or other means showing which signals are exchanged between PLCs. Also submit an HMI tag database showing all signals exchanged between the PLCs and HMI. Define any specific communication block memory addresses.

B. Submit all electronic files associated with the controller such that the Owner and Engineer can open a complete copy of the controller program using the controllers native programming package.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 CONTROLLER PROGRAMS

A. Comply with Section 6 of the Nassau County SCADA System Standards unless otherwise noted or specified.

B. Develop all application programs in a structured manner and follow an intuitive arrangement so that an instrumentation technician with basic programming knowledge will be able to understand. Utilize standard program templates or subroutines for repetitive logic such as equipment control, flow total calculations, equipment runtime calculations.

C. Make changes to the application programs and software configuration, based on comments during the submittals, the factory tests, the field tests, and during the commissioning process to meet the design intent, at no additional cost to the Owner.

D. Include configuration updates to the existing PLC-ECR as required and as shown on the drawings.

SECTION 407000 - INSTRUMENTATION FOR PROCESS SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the general requirements to furnishing, installing, and servicing PCSS provided instruments.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 4071XX “Sections for flow measurement.”
3. Section 4072XX “Sections for level measurement.”
4. Section 4073XX “Sections for pressure, strain, and force measurement.”
5. Section 4074XX “Sections for temperature measurement.”
6. Section 4075XX “Sections for liquid analytical measurement.”
7. Section 4076XX “Sections for gas analytical measurement.”
8. Section 4077XX “Sections for position and motion measurement.”

1.3 DEFINITIONS

A. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system.

B. Section 4071XX “Sections for flow measurement”: The XX in the number indicates all spec sections starting with the first 4 numbers (indicating a category described in the accompanying text) are included in the reference.

1.4 ACTION SUBMITTALS

A. Submit complete documentation for all field instruments in one comprehensive submittal. Use ISA-TR20.00.01-2007 data sheet format as a cover sheet for each instrument prior to data sheets. Submit a complete Bill of Materials (BOM) or Index that lists all instrumentation equipment, sorted by Loop Number.

B. Submit separate data sheets for each instrument type:

1. Plant Equipment Number and ISA tag number per the Drawings.

2. Product (item) name used herein and on the Drawings.
3. Manufacturer's complete model number.
4. Location of the device.
5. Input - output characteristics.
6. Range, size, and graduations in engineering units.

C. Submit the following information for each instrument type:

1. Include construction details, material descriptions, dimensions of individual components and profiles.
2. Sizing calculations where applicable.
3. Indicate which instruments will be provided with certified calibration data (i.e., all flow metering devices) as part of O&M manual.
4. Include rated capacities, operating characteristics, electrical characteristics and furnished specialties and accessories.
5. Two-wire, three-wire, or four-wire device type as applicable.
6. Indicate which instruments will be provided with manufacturer’s maintenance services if specified.
7. Indicate instruments that are located in hazardous areas based on the Area Classification table and plans (refer to Drawings G-9 through G-15).
8. Where instruments are located in hazardous areas, indicate the classification (e.g., Class I, Division 1) and protection technique utilized for the instrument as required by the NEC (NFPA 70 Art. 500.7) (e.g., explosionproof equipment, intrinsic safety, etc.)

D. Instrument Vendor Shop Drawings:

1. Include plans, elevations, sections, and mounting details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Detail fabrication and assembly of instrument.
4. Include diagrams for power, signal, and control wiring.

E. Submit catalog cuts for all instruments. Submit descriptive literature for each hardware component, which fully describes the units being provided.

F. Submit index and data sheets in electronic format as well as hard copies on 8-1/2" x 11" formats. Submit electronic copies in Microsoft Excel or Word format on DVD disk or USB thumb drive.

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Refer to individual instrument specifications for spare parts requirements.

B. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for PCSS requirements regarding submission of maintenance materials.

1.8 QUALITY ASSURANCE

A. Refer to individual instrument specifications for quality assurance requirements as well as which specific instruments require manufacturer’s start-up and training services.

B. Provide components compatible with functions required to form complete working system.

C. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for overall quality assurance requirements for PCSS scope of work.

1.9 DELIVERY, STORAGE, AND HANDLING

A. As indicated by the Manufacturer.

1.10 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.11 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 INSTRUMENT TAGS

A. Permanent stainless steel or other non-corrosive material tag firmly attached and indelibly marked with the instrument tag number, as indicated in the Drawings. Tag equipment before shipping to the site.

B. Provide 1/8-in by 3/8-in, Type 316 stainless-steel button head machine screws.

C. All supplied instrument transmitters and instrument transmitter elements require a stainless-steel identification tag. Attach tag via stainless steel chain or stainless-steel wire (24-gauge min) to a non-removable part of the device. Stamp the ISA alphanumeric instrument number as indicated on the P&ID, loop, or detail drawings into the tag. Minimum tag size is 1” H x 3” W with 3/16” high alphanumeric characters.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 INSTALLATION

A. See installation requirements in individual specification sections.

B. Mount instrumentation on instrumentation racks or stands, unless otherwise indicated. Provide shutoff and drain valves on all instrumentation connections.

C. Provide all necessary accessories and safety equipment required to meet the area classification requirements.

D. Existing instruments that are scheduled to remain in service (I.E. Ultrasonic level transducers, LE/LIT-0011-1 and -2). Coordinate with contractor to avoid installation of piping or equipment directly below the existing ultrasonic transducer. Where required, recalibrate the existing ultrasonic transducer to account for potential interference from new hardware installed in the wet well. Where software masking is deemed insufficient, Contractor shall relocate the ultrasonic spool piece and transducer.

3.2 FIELD INSTRUMENT SCHEDULE

A. The field instrument schedule Section 407000 APPENDIX A itemizes field instruments being provided by the PCSS (Division 40) or manufacturers of vendor provided equipment.

B. Each column of the field instrument schedule is defined as follows:

1. DRAWING NUMBER: The P&ID or drawing where the I/O point appears on.
2. ISA TAG AND LOOP: The identifier assigned to the field instrument.
3. TYPE: The type of instrument to be provided. For example, if the instrument is a pressure, this will specify whether it is a differential pressure transmitter, gauge pressure transmitter, etc.
4. RANGE/SETPOINT: Required measurement span/trip points of the instrument.
5. POWER: Details how the instrument will be powered.
6. SPECIFICATION NUMBER: The specification section number where the instrument details can be found.
7. INSTALLATION DETAIL: Detail on the drawings showing specific installation requirements.

SECTION 407113 - MAGNETIC FLOW METERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes magnetic flow meters.

B. Related Requirements:

1. Section 260503 “Equipment Wiring Connections.”
2. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
3. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

B. Product Test Reports: For each magnetic flow meter, for tests or calibrations performed by manufacturer and witnessed by a qualified testing agency. Provide accuracy information for flow meters for each installation location.

C. Evaluation Reports: For Magnetic Flow Meters.

© 2026 CDM Smith
All Rights Reserved

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. None Required.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

1.9 DELIVERY, STORAGE, AND HANDLING

A. As indicated by the Manufacturer.

1.10 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.11 WARRANTY

A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace components of magnetic flow meter that fail(s) in materials or workmanship within specified warranty period.

1. Warranty Period: 5 year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Furnish sensors, field preamplifiers, signal conditioners, offset and span adjustments, amplifiers, transducers, transmitters, control devices, interconnecting cables, and unit conversions and algorithms as required for application.

B. Flowmeters FE-0065-1 and FE-0065-2, shown on drawings, shall be the same make and model.

2.2 MAGNETIC FLOW METERS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide the following :
   a. ABB Instrumentation
   b. Endress+Hauser
   c. Foxboro
   d. Krohne
   e. Rosemount
   f. Siemens
   g. Or equal.

B. General:

1. Low-frequency, electromagnetic induction-type flow meter, producing a linear signal directly proportional to flow rate, consisting of flow tube, signal cable, and transmitter.

C. Type:

1. Between-flange mounting.
2. Comply with AWWA M33.

D. Performance and Design Criteria:

1. Process Fluid: Screened Sewage Influent.
2. Flow Rate Range: 0 to 112.5 MGD.
3. Accuracy: Plus or minus 0.5 percent of actual flow rate over a 30:1 range, within velocity limits of 3 to 20 ft/sec when installed in a straight run of pipe with 2 DN upstream and 5 DN downstream lengths.
4. Size: As shown on Drawings and instrument schedule in Section 407000.
5. Flow Tubes:

   a. Body Material: Carbon Steel or Type 304 stainless steel

6. Liner: Polyurethane
7. Flanges: ANSI 150lb
8. Flange Material: Carbon steel.
9. Environment: For meters with remote mounted transmitters, meters below the design flood elevation are to be suitable for submergence for up to 48 hours to a depth of 30 feet.

E. Electrodes:

1. Hastelloy C.

F. Accessories:

1. Provide nonmechanical electrode cleaning system without taking meter out of service.
2. Provide manufacturer cable between transmitter and receiver.
3. Furnish stainless-steel grounding rings, wires, and gaskets as recommended by the manufacturer. All materials must be suitable for the process and surrounding pipe.

© 2026 CDM Smith
All Rights Reserved

2.3 TRANSMITTERS

A. Manufacturer: Same manufacturer as meter.

B. Transmitter Output:

1. 4- to 20-mA DC analog signal.

C. Housing: NEMA 4X (IP65), suitable for surface or pipe stand mounting.

D. Display:

1. Touch-screen programming, functioning through enclosure window without opening enclosure.
2. Size: Four lines by 16 characters.
3. Type: Backlit digital display.
4. User-selectable engineering units.
5. Readout of diagnostic error messages.

E. Control Power:

1. 120VAC, single phase, 60 Hz.
2. Wire in accordance with Section 260503 “Equipment Wiring Connections.”
3. Provide local transformers as required.

F. Mounting:

1. Mounting: Remote, as shown on the contract drawings, up to 100 feet from flow meter.
2. Remote Mounting Locations Less Than 4 feet above Grade: Provide stainless-steel mounting posts.

G. Required Accessories:

1. A fully configurable and locally viewable totalizer integral to the transmitter.
2. Current signal output simulation.
3. Empty pipe detection.
4. Self-diagnostics.
5. Signal Cable: Provided by flow meter manufacturer.
6. Automatic zero adjust.

2.4 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of meters according to AWWA M6.

B. Owner Inspection:

1. Make completed flow meter available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing by Owner’s Representative of factory inspections and tests at manufacturer's test facility.
2. Notify Owner at least 14 days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where magnetic flow meters will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method:

1. Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures:

1. Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Magnetic flow meters will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. The start-up services include calibration, oversight of installations of the sensor, and start-up of the sensor/transmitter in order to provide reliable measurement at the instrument. Work with the PCSS and AESS to verify the transmitter sends correct information to the control system (i.e., that the scaling and units are the same at the instrument and on the control system’s operator interface/PLC). Submit an instrument calibration report in order to document the calibration procedure of the instruments.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

B. While starting up the instruments, the manufacturer to provide training to the Owner's instrumentation technicians as follows:

1. How to install, troubleshoot, read the diagnostics, verify calibration, and maintain the sensor and transmitter.
2. Provided 2 times and last up to 8 hours in the field.

SECTION 407143 - VARIABLE AREA FLOW METERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes variable area flow meters.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions”.
2. Section 407000 “Instrumentation for Process Systems”.

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. None Required

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

C. Materials in Contact with Potable Water: Certified to NSF 61 and NSF 372.

D. Refer to Section 014000 "Quality Requirements" for quality requirements.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 ROTAMETERS – TUBE TYPE

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. ABB FAM540
b. Brooks MT3809
c. King Instrument Company.
d. Omega Engineering, Inc.
e. Or equal

B. Performance and Design Criteria:

1. Design: According to AWWA M33.
2. Measuring Range: As shown in the instrument schedule in Section 407000.
3. Scale: Zero to 10 markings.
4. Accuracy: Plus or minus 5 percent of full scale.
5. Maximum Operating Temperature: 150 degrees F.
6. Maximum Operating Pressure: 100 PSIG.

C. Materials:

1. Indicator Housing: Stainless Steel.
2. Flow Tubes: Stainless Steel**.**
3. Floats: Stainless steel**.**
4. Wetted Parts: Stainless Steel**.**
5. End Fittings: Stainless steel**.**

2.2 SOURCE QUALITY CONTROL

A. Section 014000 “Quality Requirements” for testing, inspection, and analysis requirements.

B. Provide shop inspection and testing of completed assembly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where variable area flow meters will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer’s instructions for installation of rotameters.

3.3 IDENTIFICATION

A. Refer to drawings tagging designations

3.4 FIELD QUALITY CONTROL

A. Variable area flow meters will be considered defective if it does not pass tests and inspections.

B. Prepare test and inspection reports.

3.5 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

© 2026 CDM Smith
All Rights Reserved

3.6 MAINTENANCE SERVICE

A. Not Required

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION 407143

SECTION 407166 - TRANSIT TIME FLOW METERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes transit time flow meters as temporary devices in maintenance of plant operations.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. None Required.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 DESCRIPTION

A. Furnish sensors, offset and span adjustments, transmitters, interconnecting cables, and unit conversions and algorithms as required for application.

2.2 TRANSIT TIME FLOW METERS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide the following:

a. Emerson Flexim 736 series.
b. Dynasonics DXN.
c. Substitutions: Or equal.

B. Type:

1. Separate and nonintrusive transmitting and receiving transit time transducers, clamped to outside of process pipe.
2. Provide meter with the following:

a. The ability to employ an alternate Doppler measurement technique for liquids with high air or solid content.

b. "Auto Toggle" from Transit Time measurement to Doppler measurement if the signal decays due to high air or solid content, and toggle back automatically when the Transit Time signal recovers.

1) The time delay of this "Auto Toggle" feature must be programmable.
2) Perform the Transit Time/Doppler measurement with a single set of transducers.

3. The transducers shall have built in RTDs for measuring the transducer block temperature and automatically compensating for the effect that temperature change has on the transducer refraction angle and calibration, and shall be in full compliance with ASME MFC 5M.
4. The flow transducers shall be coupled to the pipe using permanent coupling pads for maintenance free operation. The use of coupling gel or grease shall not be acceptable.

C. Performance and Design Criteria:

1. Process Fluid: Screened sewage with < 10 % gaseous or solid content in volume.
2. Meets AWWA C-750 standard and ASME MFC-5.1-2011.
3. Measuring Range: As shown in the instrument schedule in Section 407000.
4. Nominal Size: As shown on Drawings and instrument schedule in Section 407000.
5. Rated for hazardous area, Class I, Division 2.

D. Required Accessories:

1. Stainless-steel mounting straps and hardware.
2. Provide manufacturer cable between transmitter and receiver.
3. When used in hazardous area:

a. Instrument sensor to be intrinsically safe or rated for the NEMA certification of the ambient conditions.
b. Where possible, mount the transmitter unit outside hazardous area.

2.3 TRANSMITTER

A. Manufacturers: Same manufacturer as flow sensor.

B. Type:

1. Microprocessor based, compatible with sensor provided.

C. Function/Performance:

1. The meter shall be capable of outputting four 4-20ma, Voltage 0-1v or 0-10v, high precision frequency 0-1kHz or 0-10kHz galvanically isolated, RS-232, RS-485, Modbus, BACnet, Foundation Fieldbus, HART, Profibus PA, Ethernet, binary output pulse or alarm for relay total and meter statusLinear with flow rate.
2. Linearity: Plus or minus 0.5 percent.
3. Repeatability: Plus, or minus ±1.0 % of reading ±0.03 ft/s.
4. Operating Ambient Temperature: -4 to 131 degrees F

5. Suitable for surface, pipe stand, or wall mounting.
6. Enclosure: NEMA 4X (IP65)

D. Display:

1. Resolution: 128 x 64 pixels
2. Type: Backlit digital display.
3. User-selectable engineering units.
4. Readout of diagnostic error messages.

E. Power Requirements:

1. 120VAC, 60 Hz or as indicated on the drawings.

F. Mounting:

1. Remote mounting, as indicated on the drawings.
2. Mounting Locations as indicated on the drawings. Provide stainless-steel mounting posts.

G. Required Accessories:

1. Provide signal cable for installation between the flow sensor and the transmitter. Length as required by installation indicated on the Drawings.

2.4 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of meters according to AWWA M6.

B. Owner Inspection:

1. Make completed flow meter available for inspection at manufacturer's factory prior to packaging for shipment.
2. Notify Owner at least seven days before inspection is allowed.

C. Owner Witnessing:

1. Allow witnessing of factory inspections and tests at manufacturer's test facility.
2. Notify Owner at least seven days before inspections and tests are scheduled.

D. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where transit time flow meters will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install as per manufacturer instruction supplied with unit.

B. Comply with NECA 1.

C. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

D. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Transit time flow meters will be considered defective if tests and inspections are not passed.

D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. The start-up services include calibration, oversight of installations of the sensor, and start-up of the sensor/transmitter in order to provide reliable measurement at the instrument. Work with the PCSS and AESS to verify the transmitter sends correct information to the control system (i.e., that the scaling and units are the same at the instrument and on

All Rights Reserved

the control system's operator interface/PLC). Submit an instrument calibration report in order to document the calibration procedure of the instruments.

3.6 MAINTENANCE SERVICE

A. Not Required.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

B. While starting up the instruments, the manufacturer to provide training to the Owner's instrumentation technicians as follows:

1. How to calibrate, install, troubleshoot, read the diagnostics, and maintain the sensor and transmitter.
2. Provided 2 times and last up to 4 hours each in the field.

END OF SECTION 407166

SECTION 407179 - FLOW SWITCHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes flow switches.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Double Pole Double Throw (DPDT): A switch with 2 inputs and 4 outputs. Each input has 2 corresponding outputs to control.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Flow switches: 1 flow switch for each unique switch installed

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

C. Materials in Contact with Potable Water: Certified to NSF 61 and NSF 372.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 THERMAL DISPERSION FLOW SWITCHES

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide the following:

a. ABB - TX units.
b. Dwyer Instruments, Inc.
c. Fluid Components International.
d. Magnetrol - Thermatel units.
e. Substitutions: Or equal.

B. Type:

1. Thermal dispersion flow switch with integral electronics enclosure.
2. Inline with flow body or insertion type as indicated on the Drawings or in the Instrument Device Schedule:

C. Function/Performance:

1. Provide a positive indication of seal water flow at ranges indicated in the instrument schedule in Section 407000.

    a. Immune to air entrainment, minor debris, and vibration.

2. Process Operating Temperature: 32 to 160 degrees F
3. Operating Temperature for Electronics: 0 to 140 degrees F.
4. Flow switch: Stable and repeatable setpoint performance suitable for low-flow seal water protection service.
5. Repeatability: ±5 percent of setpoint or better.
6. Output: One or more dry contact outputs suitable for alarm or permissive service.

    a. Minimum contact rating: 1A at 120 VAC or equivalent.
    b. Configurable for normally open or normally closed operation.

D. Physical:

1. Wetted parts to be Type 316 stainless-steel.
2. Electronics head to be NEMA 4X (IP65). Where installed in a classified hazardous location, provide a flow switch suitable for the area classification indicated on the Drawings.

E. Power Requirements:

1. 120 VAC unless otherwise indicated or approved.

F. Accessories Required:

1. For insertion type flow elements provide a hot tap assembly including a ball valve and packing gland that will allow removal of the sensor without shutdown of the process. Provide welded fitting on the pipe for the hot tap assembly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where flow switches will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260626 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings for tagging designations.

3.5 FIELD QUALITY CONTROL

A. Flow switches will be considered defective if it does not pass tests and inspections.

B. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 MAINTENANCE SERVICE

A. Not Required.

3.8 DEMONSTRATION

A. Train Owner’s maintenance personnel to adjust, operate, and maintain units.

SECTION 407223 - RADAR LEVEL METERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes radar level meters.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”

1.2 DEFINITIONS

A. Not used.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.4 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.5 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Radar level meters: One radar level sensor and transmitter for each unique meter installed.

© 2026 CDM Smith
All Rights Reserved

1.7 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

1.8 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.9 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 NON-CONTACT RADAR-LEVEL MEASUREMENT DEVICE

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following manufacturers:

a. Endress+Hauser.
b. Rosemount.
c. Siemens Automation Technology; Siemens AG Industry Sector
d. VEGA Americas, Inc.

B. Type:

1. Non-contact, microwave type level meter.
2. 80 GHz Frequency Modulated Continuous Wave (FMCW) radar frequency for continuous level measurement of liquid, slurry and sludge processes in storage vessels that may be turbulent, have heavy vapors, foaming, and nominal pressure and temperature conditions.
3. Antenna: Encapsulated.

C. Function/Performance:

1. Measuring Range: As shown in the instrument schedule in Section 407000.
2. Accuracy: Plus or minus 0.08 inches or better.
3. Operating Temperature: -40 to 176 degrees F.
4. Output: Isolated 4-20 mA output; Bluetooth configuration capability.
5. Display: Integrated or remote digital indicator capable of displaying level, volume, or percent in engineering units, as indicated on the Drawings or in the Instrument Device Schedule.

6. Remote digital indicator device for level, volume, or percent in engineering units.

D. Physical:

1. Antenna: PVDF with FKM seal, Type 316 stainless-steel, Hastelloy C or other material depending upon its compatibility to the process in which it is measuring.
2. Capable of being completely submerged without damage.
3. Both Enclosure and antenna must meet IP68 (Type 6P), suitable for submersion or equivalent ingress protection standards.
4. Provide integral antenna with transmitter.
5. Mounting:

    a. Flange:

        1) Provide with a minimum Class 150 pound (DN 80, PN16) mounting flange to match vessel flange size, material and class when mounted on pressurized vessel. Alternatively, provide suitable adapter flange for vessel operating pressures up to 43.5 psig.
        2) Provide flange material compatible with process and environmental conditions.

    b. Threaded Connection:

        1) Thread size: 1-in NPT
        2) Use appropriate gaskets or thread sealant compatible with process media.

6. Approved for Class I, Division 1, Groups C and D installation and certified for installation of the antenna in a Class I, Division 1, Groups C and D.
7. Power Requirements:

    a. 24VDC loop power.
    b. Include integrated surge protection or provision for external surge suppressors.
    c. Comply with IEC 61010-1 for equipment safety and NFPA 70 (NEC) for installation practices.
    d. Provide intrinsically safe barrier as required by the manufacturer to meet area classification requirements.

8. Remote Display: Digital indicator displaying level or volume in engineering units or percent, as indicated on the Drawings or in the instrument schedule. Display unit used to remotely program the transmitter.

    a. NEMA 4X (IP66) housing. Where the indicating transmitter is installed in a hazardous area, provide explosion-proof housing, approved for Class I, Division 1, Groups C and D installation.
    b. Must support remote programming of the transmitter via HART, Bluetooth, or manufacturer supported protocols.

E. Required Accessories:

1. Provide 316 stainless steel mounting brackets and hardware for mounting equipment, and as shown.

2. Provide hand-held programmer or manufacturer-supported configuration software compatible with the transmitter for setup, calibration, and diagnostics.

F. Manufacturer Start-up and Training services:

1. Provide manufacturer's start-up and training services as specified in the start-up and training services paragraph.

2.2 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where radar level meters will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Radar level meter will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 MAINTENANCE SERVICE

A. Not Required

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units as follows:

1. Instruction about how to calibrate, install, troubleshoot, read the diagnostics, and maintain the sensor and transmitter.

SECTION 407276 - LEVEL SWITCHES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes level switches.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”

1.2 DEFINITIONS

A. Single Pole Double Throw (SPDT): A switch with one input and two output contacts.

B. Double Pole Double Throw (DPDT): A switch with two inputs and two output contacts.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.4 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.5 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Level Switches: One level switch for each unique switch installed.

1.7 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

1.8 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.9 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 FLOAT SWITCHES

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide the following:

   a. Contegra FS90.
   b. Siemens Water Technologies Model 9G-EF
   c. Substitutions: Or equal.

B. Type:

1. Mercury free ball float switch.

C. Function/Performance:

1. Differential: Less than 8-inch.
2. Type of Switch: SPDT snap switch
3. Switch Rating: 1A at 120 VAC or 100 VA @ 120 VAC.

D. Physical:

1. Type 316 stainless steel, Teflon or non-stick coating, minimum 5 in diameter.
2. Totally encapsulated switch.
3. Heavy-duty cable, PVC or equivalent jacketed integral to float.

E. Required Accessories:

1. Provide stainless steel hardware.
2. Lead wire to be a waterproof cable of sufficient length so that no splice or junction box is required in the vault.
3. Provide cast-aluminum weatherproof junction box outside the sump pit with terminals for all floats and tapped as required for conduit connections. Provide NEMA 7 box where required by area classification.
4. Provide mounting equipment as shown on the drawings.
5. Provide Intrinsically Safe Relays for all floats installed in Class I, Div 1 or Div 2 areas.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where level switch will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Level switch will be considered defective if it does not pass tests and inspections.

B. Prepare test and inspection reports.

SECTION 407313 - PRESSURE AND DIFFERENTIAL PRESSURE GAUGES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes pressure and differential pressure gauges.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”
3. Section 407363 “Diaphragm Seals.”

1.2 DEFINITIONS

A. Not used.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.4 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.5 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Pressure and Differential Pressure Gauges: Full-size units equal to ten percent of quantity installed for each size indicated, but no fewer than one units of each kind.

1.7 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

1.8 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.9 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 PRESSURE GAGES

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide the following:

    a. Ametek US Gauge.
    b. Ashcroft.
    c. Omega Engineering, Inc.
    d. Weksler.
    e. Or equal.

B. Type:

1. Bourdon tube actuated dial face differential pressure gauge.

C. Function/Performance:

1. Accuracy: Plus or minus 1.0 percent of full-scale range.
2. Provide for zero-reading adjustment.
3. Adjusting Screws: Accessible from rear of case without need for disassembly.
4. Comply with ASME B40.100.

D. Physical:

1. Dial:

    a. Nominal Diameter: 4-1/2 inches.
    b. Face: White, laminated plastic dials with black graduations.
    c. Scale: Extend over arc not less than 200 and not more than 270 degrees.
    d. Ranges and Graduation Units: As indicated on instrument schedule.

2. Cases:

    a. Liquid filled.
    b. Material: Phenolic
    c. Provide removable rear plate.
    d. For gauge pressure, vented case for temperature/atmospheric compensation
    e. Windows:

        1) Material: Clear acrylic or shatterproof glass.
        2) Thickness: 1/8 inch.
        3) Provide gasket.

3. Bourdon Tubes:

    a. Material: Stainless steel, to brass socket.
    b. Provide welded, stress-relieved joints.

4. Connection:

    a. Location: Bottom.
    b. Socket:

        1) 1/2-inch NPT male thread.
        2) Material: Brass forging.
        3) Extend minimum 1-1/4 inches below gage cases.
        4) Provide wrench flats.

    c. Mounting: Stem or surface.

E. Required Accessories:

1. Pressure Snubber:

    a. Material: Type 316 stainless steel.
    b. Provide isolation valve.

2. Shutoff Cocks: Furnished by gauge manufacturer.
3. Provide diaphragm seals as shown on the drawings.
4. Special scales: Engineer reserves the right to require special scales and/or calibration if the manufacturer's standard is not suitable for the application.
5. Liquid fill gauges at the factory.
6. For each differential pressure switch, provide a three-valve manifold. Manifold to be Type 316 stainless steel. Manifolds to be D/A Manufacturing or Anderson Greenwood.

2.2 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where pressure gauges will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 IDENTIFICATION

A. Refer to drawings for tagging designations

3.3 FIELD QUALITY CONTROL

A. Pressure and differential pressure gauges will be considered defective if it does not pass tests and inspections.

B. Prepare test and inspection reports.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.5 MAINTENANCE SERVICE

A. Not Required.

3.6 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

SECTION 407326 - GAUGE-PRESSURE TRANSMITTERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes gauge-pressure transmitters.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”
3. Section 407363 “Diaphragm Seals.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Gauge Pressure Transmitters: Full-size units factory filled and calibrated equal to 10 percent of quantity installed for each size indicated, but no fewer than one unit.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 GAUGE PRESSURE TRANSMITTERS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. ABB 266HRH.
b. Foxboro IGP20.
c. Rosemount 3051CG.
d. Siemens Sitrans P DS III.
e. Smar LD301M.
f. Substitutions: Or equal.

A. Type:

1. Microprocessor based, intelligent type.

B. Function/Performance:

1. Measuring Range: As shown in the instrument schedule in Section 407000.

2. Accuracy: 0.075 percent of span.
3. Operating Temperature: -4 to 176 degrees F.
4. Temperature Effect: Combined temperature effects less than 0.2 percent of maximum span per 82 degrees F temperature change.
5. Output Signal: 4 to 20 mA DC linear with pressure, with HART protocol.
6. Output: Zero adjustable over the range of the instrument calibrated span is greater than the minimum calibrated span.
7. Stability: 0.05 percent of upper range limit for 1 year.
8. Response Time: Less than 1 ms.
9. Display: Digital indicator displaying pressure in the engineering units indicated on the Drawings or in the instrument device schedule.
10. Diagnostics:

    a. Self-diagnostics with transmitter failure driving output to above or below out of range limits.
    b. Simulation capability for inputs and loop outputs.
    c. Test terminals available to ease connection for test equipment without opening the loop.
    d. Registers to record minimum and maximum pressure and temperatures transmitter has been exposed to be available.

11. Over Range Protection: Provide positive over range protection to 150 percent of the maximum pressure of the system being monitored.

C. Physical:

1. Power Supply: 24 VDC loop power.
2. Enclosure:

    a. NEMA 4X (IP66), explosion proof
    b. Approved for Class I, Division 1, Groups C and D.
    c. Instruments for hazardous locations have Factory Mutual (FM), Canadian Standards Association (CSA), and CENELEC approvals and certifications as specified herein and as indicated on the Drawings or in the instrument device schedule.

3. Process Wetted Parts (except for ozone/oxygen service):

    a. Isolating diaphragm and other wetted metal parts: Type 316L stainless-steel.
    b. Gaskets and O-rings: Teflon.

4. Sensor Fill Fluid (except for ozone/oxygen service): Silicone.

D. Required Accessories:

1. Shutoff Cocks: Furnished by gauge manufacturer.
2. Provide diaphragm seals as shown on the drawings.

2.2 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where gauge pressure transmitter will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Gauge-pressure transmitter will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

SECTION 407336 - PRESSURE AND DIFFERENTIAL PRESSURE SWITCHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes pressure and differential pressure switches.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”
3. Section 407363 “Diaphragm Seals.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Pressure and Differential Pressure Gauges: 10 percent of quantity installed.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 PRESSURE AND DIFFERENTIAL PRESSURE SWITCHES

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Ashcroft.
b. Mercoid.
c. Static-O-Ring (SOR).
d. Substitutions: Or equal.

B. Type:

1. Pressure: Diaphragm actuated.
2. Differential Pressure: Mechanical differential pressure switch, diaphragm-actuated, with field-adjustable setpoint.

C. Function/Performance:

1. Accuracy:

a. Pressure: Plus or minus 5 percent of operating range.
b. Differential Pressure: Plus or minus 2.0 percent of full-scale range.

2. Range:

a. Pressure: Refer to instrument schedule in Section 407000.
b. Differential Pressure: Refer to instrument schedule in Section 407000.

3. Type of Switch: SPDT snap action.
4. Switch Rating: 10A at 230VAC.
5. Repeatability: Better than 1 percent of full scale.
6. Dead band: Adjustable to 60 percent of full scale.
7. Set Points: Adjustable between 20 and 80 percent of adjustable range.
8. Automatic reset type.
9. Over Range Protection: Provide positive over range protection to 150 percent of the maximum pressure of the system being monitored.

D. Physical:

1. Hermetically sealed switches.
2. Enclosures shall meet the area classification of the location where the device is being installed.
3. Materials:

a. Diaphragm: Stainless steel.
b. Wetted parts: 316L Stainless Steel.
c. Seals: Viton.
d. Connection port: 316 Stainless Steel.

4. Connection:

a. Location: Bottom.
b. Size: 1/4 inch.
c. Furnish taps for sensing lines.

E. Required Accessories:

1. Pressure: Provide Type 316 stainless-steel shutoff valve. Provide manifold by D/A Manufacturing, Anderson Greenwood, or equal.
2. Differential Pressure: Provide Type 316 stainless-steel three-valve manifold. Mount manifold directly to the instrument or separately mounted, as shown on the Drawings. Provide manifold by D/A Manufacturing, Anderson Greenwood, or equal.
3. Provide diaphragm seals as shown on the Drawings.
4. Where indicated on the drawings, provide Type 316 stainless-steel pressure snubber for pulsation dampening.

All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where pressure and differential pressure switches will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Pressure and differential pressure switches will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

© 2026 CDM Smith
All Rights Reserved

3.7 MAINTENANCE SERVICE

A. Not Required.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

SECTION 407363 - DIAPHRAGM SEALS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes diaphragm seals.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”
3. Section 407313 “Pressure and Differential Pressure Gauges.”
4. Section 407326 “Gauge Pressure Transmitters.”
5. Section 407336 “Pressure and Differential Pressure Switches.”

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.4 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.5 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Threaded Diaphragm Seals: 10 percent of quantity installed.
2. Annular seals: 10 percent of quantity installed.

1.7 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

C. Materials in Contact with Potable Water: Certified to NSF 61 and NSF 372.

1.8 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.9 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 DIAPHRAGM SEALS – THREADED

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Rosemount
b. Ashcroft
c. Ronnigen-Petter Company
d. Siemens
e. Marquest Scientific.
f. Winters Instruments - U.S.

B. Type:

1. Threaded, mounted directly to pressure gauge socket.

C. Physical:

1. Wetted Parts and Bolt Materials: Corrosion resistant to process fluid.
2. Provide fill/bleed screw for filling of diaphragm seal.
3. Instrument Connection: NPT, 1/4 inch.
4. Process Connection: NPT, 1/2 inch.
5. Flushing Connection: NPT, 1/4 inch.
6. Working Pressure Rating: Refer to instrument list for pressure range.
7. Calibration: Provide cleanout ring to be removed for recalibration or cleaning, without loss of filling liquid or change in calibration.

2.2 DIAPHRAGM SEALS – ANNULAR FLANGE MOUNTED

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

    a. Reotemp
    b. Siemens
    c. Wika
    d. Substitutions: Or equal

B. Type:

1. In-line mounted, between two flanges.

C. Function/Performance:

1. Pressure Limit: Correspond to flange ratings.
2. Inside diameter conforms to the dimensions of the pipe where the seal is installed.
3. ANSI or DIN Flange Class: Equivalent to the flange class of the piping where the seal is installed. Bolting dimensions conform to ANSI or DIN drilling specifications as required by the installation.

D. Physical:

1. Body material and Flange: Type 316 stainless-steel and compatible with process connection.
2. Process connection: 1/4-inch NPT.
3. Wetted Parts and Bolt Materials: Corrosion resistant to process fluid.
4. Sensing Liquid: Silicone Oil.

E. Diaphragm Seals:

1. Factory-assemble, fill, and calibrate entire assembly, including gauge switch and transmitter, prior to shipment.

    a. Accessories: Instrument quick disconnect.

2. Field filling is not acceptable.

F. Provide shop inspection and testing of completed assembly.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where diaphragm seal will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FIELD QUALITY CONTROL

A. Diaphragm seal will be considered defective if it does not pass tests and inspections.

B. Prepare test and inspection reports.

3.3 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.4 MAINTENANCE SERVICE

A. Not Required.

3.5 DEMONSTRATION

A. Train Owner’s maintenance personnel to adjust, operate, and maintain units.

SECTION 407413 - RESISTANCE TEMPERATURE DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes resistance temperature devices.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”
3. Section 432341 “End Suction Solids Handling Pumps.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Resistance Temperature Devices: Provide full set of spare units equivalent to the amount installed in each pump motor and pump bearing.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Ensure that materials of construction of wetted parts are compatible with process liquid.

C. Materials in Contact with Potable Water: Certified to NSF 61 and NSF 372.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 RESISTANCE TEMPERATURE DEVICES (RTD)

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. ABB, Process Automation Business.
b. Digi-key Electronics.
c. Dwyer Instruments, Inc.
d. Foxboro
e. Rosemount.
f. Siemens.
g. Smar
h. TE Connectivity
i. Substitutions: Or equal

B. Type:

1. Wire-wound RTD

C. Function/Performance:

1. Accuracy: Plus or minus 0.1 percent at 32 degrees F.
2. Base Resistance at 32 degrees F: 100 ohms.
3. Thermal Coefficient of Resistance: 0.00391 Ω/Ω degrees C.
4. Stability: Tested to meet IEC 60751.
5. Tolerance: Class B, according to IEC 60751.
6. Vibration Resistance: 3g over frequency range 5 Hz to 500 Hz. Tested to meet IEC 60751.
7. Self-Heating: Tested to meet IEC 60751.

D. Physical:

1. Material: Platinum
2. Comply with ASTM E1137/E1137M.
3. Encapsulation: Series 300 stainless-steel.
4. Configuration: Three-wire.
5. Connector: Four-pin; male.
6. Housing:

a. Welded housing
b. Material: Type 316L stainless steel**.**
c. Connection: Adequate for installation in motor stator and motor bearings where required.

7. Probe:

a. Diameter: 1/4 inch.
b. Length: suitable for installation location shown on Drawings.
c. Sheath Style: Stainless-steel
d. Operating Temperature: -58 to 482 degrees F
e. Maximum Response Time: 9 seconds.

2.2 SOURCE QUALITY CONTROL

A. Provide shop inspection and testing of completed assembly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where resistance temperature devices will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

© 2026 CDM Smith
All Rights Reserved

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Resistance temperature devices will be considered defective if it does not pass tests and inspections.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 MAINTENANCE SERVICE

A. Not Required.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

SECTION 407719 - VIBRATION VELOCITY MEASUREMENT DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes vibration velocity measurement devices.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”
3. Section 407723 “Vibration Monitoring Systems.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

B. Shop Drawings:

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. None Required.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

C. Services of Manufacturer’s Representative

1. Provide services of a manufacturer service representative specifically trained on type of equipment supplied. Submit qualifications of service representative for approval. The number of required days listed below are exclusive of travel time, and do not relieve Contractor of obligation to provide sufficient service to place equipment in satisfactory operation

a. Operation and Maintenance instruction: One 8-hour day.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 VIBRATION SENSORS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following**:**

a. Bently Nevada 330400 Accelerometer.

b. Metrix Instrument Company ST5491E Series sensor.
c. Substitutions: Or equal

B. Type:

1. Loop-powered seismic transmitter providing a 4-20 mA signal proportional to velocity, or acceleration/velocity/frequency data to module.

C. Function/Performance:

1. Range: 0 to 2 inch/sec or as recommended by the pump manufacturer.
2. Accuracy: 2 percent.
3. Sensitivity: 10.2 mV/m/s^2 (100 mV/g), plus or minus 5 percent.
4. Frequency Response: 10 to 1500 Hz.
5. Supply Voltage: 11 to 30 VDC.
6. Isolation: 500 Vrms, circuit to case.
7. Enclosure: Type 303 stainless steel.
8. Mounting: 1/4-inch NPT.
9. Hazard Rating: Class 1, Division 2, Groups C and D.
10. Environmental Rating: NEMA 4X (IP67).

D. Required Accessories:

1. Vibration sensors to be monitored by monitoring panel specified in Section 407723 "Vibration Monitoring Systems."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where vibration velocity measuring devices will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Vibration velocity measurement devices will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. The start-up services include calibration, oversight of installations of the sensor, and start-up of the sensor/transmitter in order to provide reliable measurement at the instrument. The factory-authorized service representative or manufacturer to work with the PCSS and AESS to verify the transmitter sends correct information to the control system (i.e., that the scaling and units are the same at the instrument and on the control system’s operator interface/PLC). Submit an instrument calibration report in order to document the calibration procedure of the instruments.

3.7 MAINTENANCE SERVICE

A. Not Required.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

B. While starting up the instruments, the manufacturer to provide training to the Owner's instrumentation technicians as follows:

1. How to calibrate, install, troubleshoot, read the diagnostics, and maintain the sensor and transmitter.
2. How to scale signals, set alarms, set shutdowns, set delay timers, display alarm events, get data and trend it in the display in the monitoring control system.

SECTION 407723 - VIBRATION MONITORING SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes vibration monitoring systems for use with vibration velocity sensors, resistance temperature devices, thermocouples, velometers and/or accelerometers.

B. The influent pumps shall be provided with a dedicated vibration and temperature monitoring system as shown.

C. Sensors:

1. The system shall include velometers to accommodate vibration measurements for the horizontal, vertical, and axial directions of each pump motor.

    a. Monitors and sensors: Appropriate to monitor the vibration range for each 700-horsepower pump.
    b. Sensors: Compatible with the monitor and have adequate output for the cable lengths required.
    c. Sensor Output: Not affected by stray magnetic fields.

2. Vibration and Temperature Sensors: Securely mounted to permanently affixed studs or brackets on the pump bearing frame.

    a. Mounting Locations: In accordance with the instructions of the pump manufacturer.
    b. Each sensor cable: Provided with stainless steel armor jacket
    c. Cable Lengths: Field verify.

D. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Section 407000 “Instrumentation for Process Systems.”
3. Section 407719 “Vibration Velocity Measurement Devices.”
4. Section 407413 “Resistance Temperature Devices.”
5. Section 432341 “End Suction Solids Handling Pumps.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

B. Shop Drawings:

1. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”
2. Provide an Input/Output or memory map for signals communicated over the plant Ethernet network to the plant SCADA/PLC system. The documentation must include all settings needed to connect the device to the plant SCADA system as required in Division 40 and shown on the P&IDs. The system must communicate with the native communication protocol of the PLC system as required by Section 406343 “Programmable Logic Controllers.” The reference sheet shall be created for each networked device and at a minimum include device IP address, protocol specific configuration parameters, a description of the data for each address/register, range, units, scaling factors, and data type (Int, Float, Boolean, etc.).

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. None Required.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

B. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

C. Services of Manufacturer’s Representative

1. Provide services of a manufacturer service representative specifically trained on type of equipment supplied. Submit qualifications of service representative for approval. The number of required days listed below are exclusive of travel time, and do not relieve Contractor of obligation to provide sufficient service to place equipment in satisfactory operation

    a. Operation and Maintenance instruction: One 8-hour day.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 VIBRATION AND TEMPERATURE MONITORING PANEL

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

    a. Bently Nevada Orbit 60 Asset Condition Monitoring Panel.
    b. Metrix Instrument Company Datawatch IX Monitoring Panel.

B. Or equal.Type:

1. Operator interface station for monitoring pump and motor vibration and temperatures via direct sensor inputs.

C. Function/Performance:

1. One monitoring panel rack provided for each pump.
2. Modules: Monitor shall include enough modules to connect the vibration and RTD sensors required by the drawings Capable of monitoring velometer/accelerometer inputs, thermocouple, DC voltage, and resistance temperature device (RTD) signals.
3. Channels Per Module: As required by the Drawings.
4. Update Rate: 8 times per second.
5. Maximum Operating Temperature: 131 degrees F
6. Outputs: Four or more SPDT relay outputs for alarming and shutdown purpose. Provide adequate quantity of relay cards to enable pump shutdown in response to any temperature or vibration condition.

a. Any sensor exceeds a high vibration/temperature (warning) or high-high vibration/temperature (shutdown), the contact will close. The vibration Alarm shall trigger at 1.5x the allowable limit and shutdown shall trigger at 2x the allowable limit. Coordinate with the pump/motor supplier for temperature setpoints. Refer to Section 432341 "End Suction Solids Handling Pumps" for additional requirements.
b. Relay Contacts: Fully configurable to alarm on any available signal based on user defined setpoints.

7. Inputs: All temperature and vibration monitoring points shall be wired to their own isolated input channel.
   a. Independently programmable time delays for both warning and alarm signals for each relay output.

8. Communications: Ethernet based communications for monitoring by the plant's PLC system.

   a. An RJ45 Ethernet port that communicates all data. The system must communicate with the native communication protocol of the PLC system as required by Section 406343 "Programmable Logic Controllers." Provide any protocol converters/gateways needed to communicate with the PLC system.
   b. The IP address assigned to each of the monitors, gateways, or other networked components shall correspond with the addressing scheme developed by the PCSS.
   c. At minimum, the following signals shall be available for continuous monitoring by the PLC:

      1) Real Time Vibration
      2) Peak Vibration
      3) Real Time Temperature
      4) Peak Temperature

9. Additional Equipment: Signal conditioners must be provided as necessary to ensure accurate measurement of vibration data throughout the RPM range of each pump.

D. Physical:

1. Panel Rating: NEMA 12 (IP54).
2. Power: 120VAC. Provide 24VDC power supplies if the vibration monitoring device does not support 120VAC. Refer to Section 407859 "Power Supplies" for additional requirements.
3. Display: A graphical touchscreen display shall be provided to show the status/feedback of each sensor. Must be panel-mountable or rack-mountable.

   a. Visual warning and alarm indications for each sensor shall be displayed on the graphical interface.
   b. Visual indication for proper operation for each sensor shall be displayed on the graphical interface.
   c. Manual reset button to acknowledge alarm conditions and reset the pump operation if the alarm conditions no longer exist.

© 2026 CDM Smith
All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where vibration monitoring system will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Vibration monitoring systems will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. The start-up services include calibration, oversight of installations of the sensor, and start-up of the sensor/transmitter in order to provide reliable measurement at the

instrument. The factory-authorized service representative or manufacturer to work with the PCSS and AESS to verify the transmitter sends correct information to the control system (i.e., that the scaling and units are the same at the instrument and on the control system's operator interface/PLC). Submit an instrument calibration report in order to document the calibration procedure of the instruments.

3.7 MAINTENANCE SERVICE

A. Not Required.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units.

B. While starting up the instruments, the manufacturer to provide training to the Owner's instrumentation technicians as follows:

1. How to calibrate, install, troubleshoot, read the diagnostics, and maintain the sensor and monitoring device.
2. How to scale signals, set alarms, set shutdowns, set delay timers, display alarm events, get data and trend it in the display in the monitoring control system.
3. Provided 2 times and last up to 4 hours in the field.

SECTION 407816 - INDICATING LIGHTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes indicating lights.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”
3. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Indicating Lights: Full-size units equal to 20 percent of quantity installed, but no fewer than 3 units.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 PILOT TYPE INDICATING LIGHTS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following**:**

a. Allen Bradley.
b. Eaton Cutler-Hammer
c. Eaton Crouse-Hinds (NEMA 7)
d. General Electric.
e. Square D.
f. Substitutions: Or equal.

B. Type:

1. Energy efficient, Solid-State LED Lamps.

C. Function/Performance:

1. Low voltage LED lamps suitable for the voltage supplied.
2. Integral reduced voltage transformers for 120VAC powered lights.
3. Replaceable lamps from the front of the unit.

4. Push-to-test operator type.

D. Physical:

1. Hazardous Area Rating: Refer to drawings for control panel locations to determine necessary rating. Provide type NEMA 4X for non-hazardous locations.

2. Lens caps: 1.18-inch (30 mm) diameter.
3. Lens color:

a. Running, On, Open - Red.
b. Stopped, Off, Closed - Green.
c. Alarm - Amber.
d. White - Power on.
e. Blue - All other status indications not covered by the above.

4. Provide legend faceplates engraved to indicate the required function of each device.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where indicating lights will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings for tagging designations

All Rights Reserved

3.5 FIELD QUALITY CONTROL

A. Indicating lights will be considered defective if they do not pass tests and inspections. Replace defective lights and re-test.

B. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 MAINTENANCE SERVICE

A. Not Required.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

SECTION 407819 - SWITCHES AND PUSH BUTTONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes switches and push buttons.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”
3. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Switches and Push Buttons: Full-size units equal to 20 percent of quantity installed, but no fewer than 2 units.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 SELECTOR SWITCHES AND PUSHBUTTONS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Allen Bradley.
b. Crouse Hinds (NEMA 7).
c. Cutler-Hammer.
d. General Electric.
e. Square D.
f. Substitutions: Or equal.

B. Type:

1. Heavy-duty oil tight type with stackable contact blocks.

C. Function/Performance:

1. Contact arrangement and switching action as required for the control system specified.

2. For 120VAC service, provide contacts rated 10A at 120VAC. For 24VDC service, provide silver sliding contacts rated 5A at 125VDC. For electronic (millivolt/milliamp) switching, provide contacts rated 1A at 28VDC.

D. Physical:

1. Hazardous Area Rating: Refer to Drawings for control panel locations to determine necessary rating of switches and push buttons. Provide type NEMA 4X for non-hazardous areas.
2. Size: 1.18-inch (30 mm) diameter.
3. Pushbuttons: Flush type operators.
4. Selector switches: Knob or wing lever operators.
5. Provide legend plates denoting switch/pushbutton position and/or function.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where switches and push buttons will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION 407819

B. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings for tagging designations.

All Rights Reserved

3.5 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.6 MAINTENANCE SERVICE

A. Not Required.

END OF SECTION 407819

All Rights Reserved

SECTION 407833 - ANNUNCIATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes annunciators.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”
3. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. None Required.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 EMERGENCY ALARM BEACON

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Benjamin.
b. Federal Signal.
c. Edwards.
d. Wheelock.
e. Substitutions: Or equal.

B. Beacon alarm light:

1. Type:

a. Beacon alarm light.

2. Physical:

a. Beacon alarm light for control panel mounting
b. Power Requirements: 120VAC
c. Flush mounted
d. NEMA 4, weatherproof construction.
e. 750,000-candle power xenon strobe tube and red polycarbonate lens.

All Rights Reserved

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where annunciators will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings for tagging designations

3.5 FIELD QUALITY CONTROL

A. Annunciators will be considered defective if they do not pass tests and inspections.

B. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 MAINTENANCE SERVICE

A. Not Required.

© 2026 CDM Smith
All Rights Reserved

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units.

B. While starting up the instruments, the manufacturer to provide training to the Owner's instrumentation technicians as follows:

SECTION 407853 - RELAYS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes relays.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Relays: Full-size units for SPDT, DPDT, 3PDT, or 4PDT equal to 20 percent of quantity installed for each size indicated, but no fewer than 2 units of each type.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 GENERAL PURPOSE RELAYS AND TIME DELAYS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Allen Bradley.
b. IDEC
c. Omron
d. Schneider Electric.
e. Substitutions: Or equal

B. Type:

1. General purpose plug-in type.

C. Function/Performance:

1. Provide all relays with number of poles required to meet the design intent.
2. Mechanical life expectancy to be in excess of 10 million.
3. Provide solid state time delays with polarity protection (DC units) and transient protection.
4. Time delay units in ranges from .1 second to 4.5 hours.

D. Physical:

1. Mounting: DIN rail.
2. Integral indicating light to indicate if relay is energized.
3. For 120 VAC service, provide contacts rated 10A at 120VAC. For 24 VDC service, provide contacts rated 5A at 28VDC. For electronic (milliamp/millivolt) switching applicator, provide gold plated contacts rated for electronic service.
4. Dust and moisture resistant covers.

E. Required Accessories:

1. Provide DIN rail mounted relay socket for each relay, rated 10A at 300VAC.

2.2 SIGNAL RELAY SWITCHES (CURRENT TRIPS)

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Acromag.
b. Action Instruments Slim Pak.
c. Substitutions: Or equal

B. Type:

1. Solid state, ASIC technology, electronic type.

C. Functional:

1. Input: 4-20 mA.
2. Output: Isolated contact output, double pole double throw, rated 5A at 120VAC.
3. Accuracy: 0.1 percent.
4. Protection: Provide RFI protection.
5. Deadband: Adjustable between 0.1 and 5.0 percent of span.
6. Set point Adjustment: Single Point alarms adjustable to trip on rising or falling input signal, dual point alarms adjustable to trip on rising and falling input signals.
7. Repeatability: Trip point repeatability at least 0.1 percent of span.

D. Physical:

1. Mounting: DIN rail.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where relays will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings for tagging designations

3.5 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.6 MAINTENANCE SERVICE

A. Not Required.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

SECTION 407856 - ISOLATORS, INTRINSICALLY SAFE BARRIERS, AND SURGE SUPPRESSORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes isolators, intrinsically safe barriers, and surge suppressors.

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”
3. Section 407000 “Instrumentation for Process Systems.”
4. Section 4072XX “Sections for level measurement.”
5. Section 407336 “Pressure and Differential Pressure Switches.”

1.3 DEFINITIONS

A. Section 4072XX “Sections for level measurement”: The XX in the number indicates all spec sections starting with the first 4 numbers (indicating a category described in the accompanying text) are included in the reference.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”
2. Clearly indicate which instruments will have surge protection and either separate enclosures or conduit mounts. Provide listings and/or tables indicating location for both building and field devices.

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Isolators, Intrinsically Safe Barriers, and Surge Suppressors: Full-size units equal to 20 percent of quantity installed, but no fewer than 3 units per type.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 SIGNAL ISOLATORS/BOOSTERS/CONVERTERS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Acromag.
b. Action Instruments Slim Pak.
c. Substitutions: Or equal.

B. Type:

1. Solid state, ASIC technology; electronic type.

C. Function/Performance:

1. Accuracy: 0.15 percent.
2. Inputs: Current, voltage, frequency, temperature, or resistance as required.
3. Output: Current or voltage as required.
4. Isolation: Complete isolation between input circuitry, output circuitry, and power supply.
5. Adjustments: Zero and span adjustment.
6. Protection: Provide RFI protection.

D. Physical:

1. Mounting: DIN Rail.

2.2 INTRINSIC SAFETY BARRIERS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Gems – 54800 (4-20mA) and 65800 (dry contacts).
b. R. Stahl – Intrinspak.
c. Siemens Water Technologies – IS1 (4-20mA) and IS6 (dry contacts).
d. Substitutions: Or equal.

B. Type:

1. Solid state electronic type in which the energy level of the sensing or actuation circuit is low enough to allow safe usage in hazardous areas.

C. Function/Performance:

1. Provide a barrier for instrumentation and equipment transmitting analog or digital signals that originate in a hazardous area as indicated in the design documents.
2. Locate in non-hazardous areas.
3. Match power supply provided.

D. Physical:

1. Mounting: DIN Rail.

2.3 INTRINSIC SAFETY BARRIERS (FOR 2-WIRE TRANSMITTER SYSTEMS)

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Gems.
b. P&F.
c. Unitech.
d. Substitutions: Or equal

B. Type:

1. Passive devices requiring no external voltage supply.

C. Function/Performance:

1. Supplied with series resistors, series fuse and shunt zener diodes to limit the transfer of energy to levels required by intrinsically safe protection between safe and hazardous locations.
2. Factory Mutual approved and certified for use in accordance with National Fire Protection Association (NFPA 493).

D. Physical:

1. Mounting: DIN Rail.

2.4 SURGE PROTECTION FOR CONTROL SYSTEMS

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Citel
b. MTL Surge Technologies
c. Phoenix Contact
d. Transtector
e. Substitutions: Or equal

B. Function/Performance:

1. Provides surge protection of electronic instrumentation from induced surges propagated along the signal and power supply lines from lightning, utility, or the plan electrical systems.
2. Protection system lower than the instrument withstand level, while not interfering with normal operation.
3. Maintenance free and self-restoring.
4. Response time: Within nanoseconds.

C. Required Surge Protection:

1. Control Panel Power Feed (120VAC).

a. Provide protection of 120VAC power feed into control panels, server racks, network racks, and communication enclosures.

b. Nominal Discharge surge current: 20kA (at an 8x20µs impulse waveform) when nominal Current is 20A and accepts 12-24 AWG wire connection
c. Provide surge protector from one of the following:

1) Citel DS40 series
2) MCG Surge Protection PT Series (for Control Panels)/ 400 series (For Equipment)
3) Phoenix Contact "PLT/PT" or VAL-US series
4) Transtector AC SPD I2R Series
5) Substitutions: Or equal.

2. 4-Wire Field Instrument Power:

a. Provide surge protection at the field device to protect 120 VAC power and 24 VDC power to analog instrument.
b. Mount transmitter surge protectors in separate NEMA 4X enclosure for field installations.
c. Nominal Discharge surge current: 2.5kA (at an 8x20µs impulse waveform).
d. Provide Field Mounted (at instrument) surge protector from one of the following:

1) Phoenix Contact BoxTrab BXT-N4X Series
2) MTL Surge Technologies SDyyX series
3) Substitutions: Or equal.

3. Analog Signal (4-20mA) Circuits:

a. Provide surge protection where any part of the circuit is outside of the building envelope.
b. Mount transmitter surge protectors in separate NEMA 4X enclosure or conduit mount for field installations.
c. Protect circuits at both the transmitter side and the PLC panel side of the circuit.
d. Nominal Discharge surge current: 10kA (at an 8x20µs impulse waveform). Provide Field Mounted (at instrument) surge protector from one of the following:

1) Phoenix Contact SurgeTrab S-PT Series
2) MTL Surge TechnologiesTP48
3) Citel TSP M series.
4) Substitutions: Or equal.

e. Provide panel mounted surge protector for Field Mounted Instruments from one of the following:

1) Phoenix Contact TermiTrab TTC Series
2) MTL Surge Technologies SD series
3) Citel DLA series. DLC series
4) Substitutions: Or equal.

4. Inductive Loads:

a. Provide coil surge suppression devices, such as varistors or interposing relays, on all process controller outputs or switches rated 120VAC or less that drive solenoid, coil, or motor loads.
b. Nominal Discharge surge current: 20kA (at an 8x20µs impulse waveform)
c. Provide surge protector from one of the following:

1) Citel DS240S series
2) Phoenix Contact PT series
3) Substitutions: Or equal

5. Non-Fiber Based Data Highway or Communications Circuits:

a. Provide protection on all communication and data highway circuits that leave a building or are routed external to a building.
b. Provide circuit protection at both ends of the line.
c. Nominal Discharge surge current: 2kA (at an 8x20µs impulse waveform)
d. Provide surge protector from one of the following based on specific application:

1) Phoenix Contact DATA Trab or PlugTrab PT Series,
2) Transtector FSP Series, CPX series
3) MTL Surge Technologies ZoneBarrier NC Series,
4) Citel DLA series, MSP Series
5) Substitutions: Or equal.

6. Ethernet Connection:

a. Provide protection on all communication and data highway circuits that leave a building or are routed external to a building.
b. Mount surge protectors in enclosures for field installations.
c. Provide circuit protection at both ends of the line.
d. Nominal Discharge surge current: 2kA (at an 8x20µs impulse waveform)
e. Provide surge protector from one of the following based on specific application:

1) Phoenix Contact DATA Trab Series,
2) Transtector FSP Series, CPX series
3) MTL Surge Technologies ZoneBarrier NC Series,
4) Citel DLA series, MJ8 Series
5) Substitutions: Or equal

7. Serial Connection (RS-485/RS-232):

a. Provide surge protection on RS-485 connection. Connection method to device by 9-position D-SUB connector
b. Mount surge protectors in separate NEMA 4X enclosure for field installations.
c. Provide circuit protection at both ends of the line.
d. Nominal Discharge surge current: 5kA (at an 8x20µs impulse waveform)
e. Provide surge protector from one of the following based on specific application:

1) Phoenix Contact DATA Trab Series, DT-UFB-485/BS
2) Transtector FSP Series,
3) MTL Surge Technologies Zone Barrier Series,

4) Citel Data Line, DD series
5) Substitutions: Or equal

8. RF Coaxial Cable:

a. Provide protection on communication cables between radios and antennas, mounted either inside the panel, or in the wall of the enclosure.
b. Protected in accordance with NEMA and UL 497E standards.
c. Nominal Discharge surge current: 5kA (at an 8x20µs impulse waveform)
d. Provide surge protector from one of the following:

1) Citel P8AX series
2) Polyphaser GT Series
3) Phoenix Contact Coax Trab series
4) Substitutions: Or equal.

9. Telephone Circuits:

a. Provide Telephone Company approved line protection units for all telephone lines used for telemetry or SCADA system use under this Contract.
b. Nominal Discharge surge current: 10kA (at an 8x20µs impulse waveform)
c. Provide surge protector from one of the following:

1) Citel MJ8-Telecom or DLA series
2) Phoenix Contact Data Trab Series or PT-IQ Series
3) Substitutions: Or equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and rooms for suitable conditions where products will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings for tagging designations.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Isolators, intrinsically safe barriers and surge suppressors will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 MAINTENANCE SERVICE

A. Not required.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

SECTION 407859 - POWER SUPPLIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes power supplies

B. Related Requirements:

1. Section 406100 “Process Control and Enterprise Management Systems General Provisions” for submittal requirements.
2. Section 406717 “Industrial Enclosures.”
3. Section 407000 “Instrumentation for Process Systems.”

1.3 DEFINITIONS

A. Not used.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Refer to Section 407000 “Instrumentation for Process Systems.”

B. Shop Drawings:

1. Refer to Section 407000 “Instrumentation for Process Systems.”

1.5 INFORMATIONAL SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions” for any PCSS requirements regarding informational submittals for instruments.

1.6 CLOSEOUT SUBMITTALS

A. Refer to Section 406100 “Process Control and Enterprise Management System General Provisions.”

© 2026 CDM Smith
All Rights Reserved

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Power Supplies: Equal to 10 percent or two units for each size used, whichever is greater.
2. Redundancy Modules: Equal to 10 percent or two units for each size used, whichever is greater.

1.8 QUALITY ASSURANCE

A. Provide components compatible with functions required to form complete working system.

1.9 FIELD CONDITIONS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.10 WARRANTY

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

PART 2 - PRODUCTS

2.1 POWER SUPPLIES (24VDC)

A. Manufacturers:

1. Manufacturers and their products are subject to compliance with requirements. Provide one of the following:

a. Allen-Bradley.
b. Phoenix Contact.
c. SOLA HD.
d. Substitutions: Or equal.

B. Type:

1. Redundant power supplies that operate in parallel with an independent redundancy module to power field instruments and panel devices as shown on the Drawings.

C. Function/Performance:

1. Input power: 115VAC, plus or minus 10 percent, 60 Hz.
2. Output voltage: 24VDC.

3. Output voltage adjustment: 5 percent.
4. Line regulation: 0.05 percent for 10V line change.
5. Load regulation: 0.15 percent no load to full load.
6. Ripple: 3 mV RMS.
7. Operating temperature: 32 to 140 degrees F.
8. Sized to accommodate the design load plus a minimum 25 percent spare capacity.

D. Physical:

1. Mounting: DIN rail. Mounted such that heat dissipation does not adversely affect other panel components.
2. Equipped with power on/off circuit breaker.
3. Provide relay contact (internal to the redundancy module or external if the power supply is not so equipped) to indicate on/off status of the power supply.
4. Provide relay contact to indicate power supply fault.
5. Output overvoltage and overcurrent protective devices to protect from damage due to power supply failure and external failure.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, roofs, and process area for suitable conditions where power supplies will be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

3.3 CONNECTIONS

A. Refer to Section 260526 “Grounding and Bonding for Electrical Systems.”

3.4 IDENTIFICATION

A. Refer to Drawings and control system architecture for tagging designations

© 2026 CDM Smith
All Rights Reserved

3.5 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.6 MAINTENANCE SERVICE

A. Not required.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

SECTION 408100 – INDUSTRIAL CONTROL SYSTEM CYBERSECURITY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section

1.2 SUMMARY

A. Section includes all programming, configuration, and related services to implement security controls or countermeasures for the industrial control system to be performed by the PCSS. Control system, including vendor package systems and existing equipment, must function in full conformity with the Contract Drawings and specifications with security controls applied.

B. Provide configuration of equipment to maintain existing control system functionality and diagnostics with implemented countermeasures.

C. Coordinate work with plant operating personnel to minimize impacts on daily operation. Formally note and submit details on any delays caused during startup to the Engineer and Owner in the form of a letter.

D. Related Requirements:

1. Section 4061XX “Sections for Process Control System Supplier Requirements.”
2. Section 4063XX “Sections for Control System Equipment.”
3. Section 4066XX “Sections for Network and Communication Equipment.”

1.3 ACRONYMS AND DEFINITIONS

A. Process Control System Supplier (PCSS): The entity responsible for providing all materials, equipment, labor, and services required to achieve a fully integrated and operational control system, including the cybersecurity requirements included in this Section.

B. “Section 4062XX - Sections for Computer System Hardware” – The XX in the number indicates all spec sections starting with the first 4 numbers (indicating a category described in the accompanying text) are included in the reference.

C. HMI - Human Machine Interface.

D. MAC – Media Access Control.

1.4 COORDINATION MEETINGS AND WORKSHOPS

A. Refer to Section 406100 “Process Control and Enterprise Management Systems General Provisions.”

1.5 ACTION SUBMITTALS

A. Refer to Section 406100 "Process Control and Enterprise Management Systems General Provisions."

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For any named CSSP, submit a statement on company letterhead indicating that the requirements in the “Quality Assurance” paragraph below are met by the firm.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 IDENTIFICATION AND AUTHENTICATION CONTROL

A. User Identification and Authentication

1. Users accessing the Operator Interface Terminals provided under this contract are required to provide a unique identifier and password to access the control system graphic interface.

B. Identity Management

1. Accounts for the Control System’s Windows based computers are centrally managed using the existing Windows Active Directory System. Any modifications to the existing HMI system must utilize the existing user groups utilized by the Active Directory and HMI integration to the Active Directory.

C. Authenticator Management

1. Change default passwords associated with control system equipment that supports user accounts or accounts supplied as part of this Project, including but not limited to routers, switches, PLCs, servers, and workstations.

3.2 USE CONTROL

A. Authorization Enforcement

1. User accounts must be assigned a security group, and system permissions are defined by the associated group. Security groups and permissible actions must be approved by the

Owner and Engineer. User group assignment is determined by the least functionality required to complete job assignments. Coordinate with requirements of the HMI system in Section 406863.

B. Session Lock

1. Systems where the HMI system is required to be always active must log the user into a view only account after 15 minutes of inactivity. When in the view only account, operations will have access to view alarms and process control.

3.3 DATA CONFIDENTIALITY

A. Use of Secure Protocols

1. Configure the system to reject the use of communication of the following insecure protocols.

a. FTP
b. Telnet
c. SNMP v1, SNMP, v2
d. TLS 1.0. TLS 1.1
e. HTTP

3.4 RESTRICTED DATA FLOW

A. Network Segmentation

1. Configure the control system network to logically segment non-control system networks from the control system network and to logically segment critical control system networks from other control system networks as shown on the drawings.
2. Establish network segments dedicated to specific types of network traffic, with clearly defined boundaries between each segment.

a. Segments must be physical or logical (i.e., VLAN configurations) as shown on the drawings.
b. Coordinate with the Owner for information on the VLANs used for equipment provided for this project.

3.5 RESOURCE AVAILABILITY

A. Network and Security Configuration Settings

1. Fully document and backup network device configurations and settings. Once network devices are configured, perform a backup of the configuration settings. Take additional backups for individual devices if any changes are made following the initial backup.

B. System Component Inventory

1. Provide an inventory of IP-based control system hardware. The inventory list includes device name, device description, model and manufacturer, physical location, IP addressing information, MAC address, interface connection information (*i.e.,* what interface is used on the device itself), and where the device is connected (*i.e.,* switch or switch interface information).
2. Provide the Operating System software version/patch level and firmware revision for the control system, including all servers and workstations, PLCs, intrusion detection systems (IDS), data diodes, and network components.

3.6 SYSTEM AUDITING

A. System Logs

1. Enable logs for devices in the control system with the capability to generate logs, including but not limited to routers, modems, switches, firewalls, servers, workstations, and controllers.

    a. Log types include but are not limited to system logs, application logs, and security logs.

B. Timestamps

1. Coordinate with the Owner such that equipment provided under this contract is synchronized using an existing central Network Time Protocol (NTP).

3.7 GENERAL SYSTEM HARDENING

A. Network Hardening

1. Disable unused network interfaces on managed switches and physically restrict or ‘lock’ access to any unused port on unmanaged switches with physical port locks.
2. Ensure network devices are operating using the most up to date stable operating system or firmware ensuring compatibility with all application software.
3. Disable features for re-directing traffic that are not required (*e.g.,* ICMP redirects, IP source routing).
4. Disable features for probes and scans in reconnaissance attacks (*e.g.,* Finger, ICMP unreachable, ICMP mask reply).
5. Ensure security of terminal connections (*e.g.,* IP ID service, TCP keepalives).
6. Disable gratuitous ARP and proxy ARP.
7. Disable IP-directed broadcasts.
8. Ensure no overlapping or duplicate router or firewall rules.
9. Ensure no unused rules are present in routers or firewalls.
10. Wherever possible, do not use clear text protocols on the internal (trusted) network. Use encryption where possible (*e.g.,* SSH, SNMP (version 3), HTTPS instead of Telnet, HTTP).

B. Industrial Control Device Hardening:

1. Configure devices installed within the control system network designed to monitor and control processes and equipment based on the following practices:

    a. Install vendor recommended firmware updates.
    b. Disable unused network interfaces, where possible.
    c. Disable remote program changes and password protect the application.
    d. Remove default accounts where possible.
    e. Enable logging on each device.
    f. Disable unneeded services, such as webserver and file transfer.
    g. Disable protocols not used by current system configurations or as requested by the Owner such as HTTP, FTP, SNMP, ICMP, etc.

SECTION 432341 – END SUCTION SOLIDS HANDLING PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Vertical end suction solids handling pumping system at the Cedar Creek Water Pollution Control Plant Influent Pump Station, including, but not limited to, pumps, motors, shaft couplings, line shafting, eddy current drives, and vibration and temperature monitoring.
2. Supervisory services during installation and field testing of each unit and instructing the regular operating personnel in the proper care, operation and maintenance of the equipment.
3. Pump manufacturer/supplier shall have unit responsibility for the pumping system.
4. Delegated Design.
5. Eddy Current Drives.

B. Application

1. Pumping units pump raw wastewater from influent wet well to headworks facility.

C. Related Requirements:

1. Section 036000 “Grouting” for grouting associated with pumping unit base installation.
2. Section 055000 “Metal Fabrications”: Fasteners, brackets, and other miscellaneous metal fabrications as required by this Section.
3. Section 260505 “Medium Voltage Cables” for conductor requirements.
4. Section 260519 “Low-Voltage Electrical Power Conductors and Cables” for connections and terminations.
5. Section 260523 “Control-Voltage Electrical Power Cables” for connections and terminations.
6. Section 260573 “Power System Studies” for harmonic study requirements.
7. Section 400593.13 “Medium Voltage Motor Requirements for Process Equipment”: Electric motors and accessories normally supplied as part of equipment assemblies.
8. Section 406100 “Process Control and Enterprise Management Systems”.
9. Section 406121 “Process Control System Testing”.
10. Section 406126 “Process Control Descriptions”.
11. Section 407000 “Instrumentation for Process Systems”.

All Rights Reserved

1.3 ACTION SUBMITTALS

A. If manufacturing techniques differ, completely describe all aspects that do not conform to specifications.

B. Shop Drawings and Product Data:

1. Manufacturer's literature, bulletins, and/or catalogs describing equipment in sufficient detail to indicate conformance with this Section.
2. Equipment total weight, including weight of single largest item.
3. Certified shop and erection drawings showing dimensions and details of construction and dimensions.
4. Drawings showing installation of equipment in designated locations including dimensions and piping connections, based upon field measured dimensions.
5. Complete Bill of Materials.
6. Parts arrangement drawing including materials of construction of each part.
7. Details of accessory components: Shaft couplings, extended shaft.
8. Equipment nameplate data.
9. Data on the characteristics and performance of each pump:

    a. Catalog sheets showing a family of curves covering full range selection of impeller diameter.
    b. Guaranteed Performance Curves:

        1) Based on actual shop tests on similar units.
        2) Show the specified requirements for head, capacity, efficiency, guaranteed maximum net positive suction head required (NPSHR), and brake horsepower.
        3) Clearly identify Preferred Operating Region (POR) and Allowable Operating Region (AOR) (refer to ANSI/HI 9.6.3).
        4) Demonstrate compliance with ANSI/HI 14.6 acceptance grade 1U for specified design point and acceptance grade 1E for the other specified points.
        5) Plot Curves on 8 1/2-inch by 11-inch sheets at as large a scale as practical specifically for the pump proposed. Show no-flow condition at shut-off head to pump capacity at minimum specified Total Head (TH).
        6) Variable Speed Pumps: Include variable speed curves with five evenly spaced speeds plotted from maximum to minimum recommended speeds.

10. Equipment Base Drawing:

    a. Indicate size and location of bolt holes for anchorage plus details of anchorage of equipment to foundation including anchor bolt type, size, materials, embedment depth, and minimum edge distance.
    b. Summary of external weight and thrust loads applied to the supporting structure.
    c. Summary of maximum vertical and horizontal reactions at each anchor bolt considering all applicable loads and load combinations.
    d. Submit manufacturer's specification and data including recommended design values and physical characteristics for the selected anchors to the concrete foundation.

11. Description of painting and protective coatings.
12. Complete master wiring diagrams, elementary or control schematics, including coordination with electrical equipment and control devices, and suitable outline drawings showing such details as are necessary to locate conduit stub-ups and field wiring.
13. Data for electric motors in accordance with Section 400593.13 “Medium Voltage Motor Requirements for Process Equipment”.

1.4 DELEGATED DESIGN SUBMITTALS

A. Delegated Design Submittals: Submit New York State registered signed and sealed Shop Drawings with design calculations and assumptions for equipment base anchorage**.**

B. Vaned-Flow Conditioning Spool:

1. Submit shop drawings.

    a. Include weight, materials, dimensions, and calculations for flow conditioner.

C. Equipment Base Drawing:

1. Using manufacturer’s provided size and location of bolt holes for anchorage, provide details of anchorage of equipment to foundation including anchor bolt type, size, materials, embedment depth, and minimum edge distance.

    a. Summary of external weight and thrust loads applied to the supporting structure.
    b. Summary of maximum vertical and horizontal reactions at each anchor bolt considering all applicable loads and load combinations.
    c. Manufacturer to submit signed and sealed seismic certification if required by authority having jurisdiction.

2. Submit specification and data including recommended design values and physical characteristics for the selected anchors to the concrete foundation.

1.5 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificates:

1. Certify that products meet or exceed specified requirements.
2. Certification from the motor manufacturer that the motors are capable of continuous operation without affecting the design life of bearings or windings.
3. Certify pump and motor bearing life meets or exceeds specified value. Motor bearing life is stated in Section 400593.13 “Medium Voltage Motor Requirements for Process Equipment.” Include supporting data.
4. Certify setting plan, with tolerances, for anchor bolts.
5. Manufacturer's certification of installation meeting Manufacturer’s installation, operation and maintenance manuals and as specified in PART 3.
6. Welder certifications.

B. Test and Evaluation Reports:

1. Dynamic Vibration Analysis Report:

a. Submit prior to manufacturing equipment.
b. Include backup information and sufficient detail to confirm that the specified requirements have been met.
c. Include a statement of guarantee that the required analyses were completed and the specified limitations met.

C. Manufacturer Instructions:

1. Delivery, storage and handling instructions. Include storage power requirements for space heater and terminal board.
2. Installation instructions, including anchoring layout and details.

D. Source Quality-Control Submittals:

1. Schedule including factory testing and anticipated delivery dates of equipment to job site.
2. Shop testing procedures, pump and piping set up, equipment to be used and testing tolerances.
3. Certified results of hydrostatic testing.
4. Certified shop hydraulic performance testing results.
5. Certified motor test data as described in Section 400593.13 “Medium Voltage Motor Requirements for Process Equipment”.
6. Inspection report of pump condition prior to shipment.

E. Field Quality-Control Submittals:

1. Identify the entity and experienced individual who will inspect the installation.
2. Documentation from Manufacturer’s representative attesting that equipment has been properly installed and is ready for startup and testing.
3. Field testing procedures, equipment to be used, and testing tolerances.
4. Field testing results.

F. Qualifications Statements: Manufacturer Qualifications, as required by Article Quality Assurance.

G. The pump manufacturer/supplier shall coordinate with the motor manufacturer and Eddy Current Drive manufacturer and submit, as part of the shop drawings, a written statement signed by the pump manufacturer/supplier and eddy current drive manufacturer. This written statement shall certify that the eddy current drive manufacturer has received the required information from the pump manufacturer/supplier and motor manufacturer; that all parties have reviewed the system and coordinated the equipment selection; and that the pumps, motors, drives and controls are designed to operate continuously at any and all points within the required range of operation, without overheating, without cavitation and without excessive vibration or strain. Include with this written statement all motor data and information that has been used for the coordination.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Manual:

1. Provide an Operating and Maintenance Manual for the equipment specified herein, specifically prepared for this installation and including all required drawings, equipment and materials information, descriptions, complete bill of materials, etc., as required to instruct operating and maintenance personnel unfamiliar with such equipment.

B. Warranty Documentation:

1. Submit warranty complying with requirements herein and Section 017700 “Closeout Procedures”.

C. Project Record Documents:

1. Submit Project Record Documents recording actual locations and final orientation of all equipment and accessories.
2. Include field measured dimensions for actual equipment locations and all piping connections.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Manufacturer's Recommended Spare Parts List:

1. Include gaskets and related materials.
2. List all bearings by the bearing manufacturer's numbers only.
3. Include Manufacturer's current price for each item; pricing to remain in effect for not less than one year after Substantial Completion.

B. Prepare spare parts for long term of storage and pack in containers that clearly identify contents with indelible markings.

C. Provide the following spare parts – one set:

1. One mechanical seal.
2. One complete set of gaskets, “O”-rings, etc.
3. One shaft sleeve (if utilized).
4. One full rotating assembly for single pump (bearings, impeller, etc.)

D. Provide any special tools required to maintain the equipment.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Company specializing in manufacturing products specified in this Section with minimum five years of documented experience.
2. Minimum of five operating installations with pumps of the same size or larger and in the same service as specified.

3. Certified to ISO 9001 standard for design and manufacture of this type of pump.
4. Manufacturer or its representative shall have an authorized warranty center within a 300 mile radius of the Project site, fully staffed with factory trained mechanics, confirm service facility and strategic spare parts.

B. Provide pumping units by a single Pump Manufacturer.

C. Pump Manufacturer has unit responsibility for providing and coordinating the pumping system, including, but not limited to, the pumps, motors, eddy current drives, vibration and temperature monitoring, and supporting base.

D. Manufacture pumps in accordance with Hydraulic Institute Standards, except where otherwise specified.

E. Provide new and unused equipment from Manufacturer's standard product line having a successful record of manufacturing and servicing similar equipment and systems for a minimum of five years.

F. Welders of Pressure-Containing Fabrications: Qualified to ASME Code Section 9 or AWS D1.1 Structural Welding Code – Steel.

G. Eddy current drives shall be designed, built and tested in accordance with the latest applicable editions of ANSI/IEEE, NEMA, and UL.

H. The eddy current drive manufacturer shall have 10 years' experience in the design and be regularly engaged in manufacturing and servicing equipment for installations of the type and size specified under this Section.

I. Each eddy current drive shall be totally compatible with the driven equipment and motors. The eddy current drive shall be matched to the driven equipment specific load requirements for each system specified in this Section or as shown on the Contract Drawings.

J. In order to ensure that all equipment is properly coordinated, the eddy current drive manufacturer shall coordinate application date with the driven equipment suppliers.

K. All eddy current drives that comprise a given system shall be similarly equipped. Similar components of each system shall be the product of a single manufacturer.

L. All materials, equipment and parts comprising each eddy current drive shall be new, of current manufacture and of the highest grade. All components shall be covered by the manufacturer's standard warranty on new eddy current drives.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Specific written approval from Engineer is required prior to shipment of pumps.

B. Do not disassemble factory assembled parts and components for shipment unless written permission received from Engineer.

C. Ship pumping units with motor space heaters connected to a terminal board ready to be energized. Promptly energize motor space heaters during storage. House pumping units in weatherproof enclosures at all times during storage.

D. Inspection: Accept materials on Site in Manufacturer's original packaging and inspect for damage. As necessary, provide inspection report to Manufacturer identifying any damage and rework necessary prior to installation.

E. Store pumps and all appurtenances according to Manufacturer's instructions.

F. Rotate pumps once a week at a minimum to ensure proper maintenance.

G. Protection:

1. Protect materials from moisture and dust by storing in clean, dry location remote from construction operations areas.
2. Provide additional protection according to Manufacturer's instructions.
3. Protect unpainted finished iron and steel surfaces to prevent rust and corrosion.
4. Protect finished surfaces of exposed flanges with wood or equivalent blank flanges.
5. Protect bearings against formation of rust in accordance with bearing manufacturer's recommendations. Apply lubricant or corrosion inhibiting treatment during transportation, storage, handling, installation, and lapse of time prior to start-up. Intermittently manually rotate equipment prior to start-up to ensure distribution of lubricant/protection.

H. Eddy current drives shall be delivered, stored and handled in accordance with the manufacturer's instructions and the following:

1. Eddy current drive equipment shall be inspected for shipping damage or loose parts when received.
2. Evidence of water which may have entered equipment during transit shall be checked for.
3. Eddy current drive equipment shall be stored in a clean, dry location in which a uniform temperature is maintained. Equipment shall be protected with coverings and air circulation shall be maintained.
4. Eddy current drive shall be maintained and regularly inspected by Contractor, in accordance with manufacturer's instructions, prior to installation.

1.10 FIELD CONDITIONS

A. Ambient Temperature Range: 60 to 104 degrees F.

1.11 WARRANTY

A. Provide Manufacturer's warranty for all equipment provided under this Section.

B. Warranty Period: Five year extended warranty from date of Substantial Completion as determined by engineer.

C. Manufacturer's warranty period runs concurrently with the Contractor's warranty period. No exception to this provision is allowed.

D. Warrant equipment free from defects in workmanship, design and materials. If any part of the equipment should fail during the warranty period, replace and restore unit(s) to service.

E. The sequence of construction relies upon operation of new influent pumps in various interim configurations. The manufacturer shall provide written confirmation that operation in all interim configurations will not void warranties.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. The Cedar Creek Water Pollution Control Plant Influent Pump Station is a six-pump station, three per wet well. The pump are dry-pit solids handling pumps with extended shafts to an eddy current drive and motor.

2.2 MANUFACTURERS

A. Subject to compliance with requirements, provide pumps by one of these manufacturers:

1.	Patterson:	F30B
2.	KSB:	Sewatec 700-902
3.	Flygt AC, a Xylem brand:	30 x 24 SSE

B. Subject to compliance with requirements, provide Eddy Current Drives by the following manufacturer:

1. Dynamatic Model SPMV-8240 Vertical Eddy Current Drive
2. Magnadrive 2500 series
3. Or Engineer Approved Equal per Division 00/01 requirements.

C. Subject to compliance with requirements, provide Eddy Current Controller by the following manufacturer:

1. Dynamatic Model EC-2000 HPP digital Controller
2. Magnadrive 2500 series
3. Or Engineer Approved Equal per Division 00/01 requirements.

D. The contract documents are based upon the specific dimensions and operating characteristics of the Patterson pump and Dynamatic eddy current drive specified above. Provision for substitute equipment, therefore, may require partial re-design and modification of associated facilities i.e.: piping arrangements, structural dimensions, etc., which shall be at contractor's own expense and must receive approval by the engineer.

E. A physical model of the system shown on the contract drawings and the Patterson equipment specified herein has been performed

© 2026 CDM Smith
All Rights Reserved

2.3 PERFORMANCE AND DESIGN CRITERIA

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 013300 ”Submittal Procedures” and Section 014000 “Quality Requirements” to design equipment base anchorage.

B. Performance:

1. Standards:

a. ANSI/HI 9.6.1 Rotodynamic Pumps – Guideline for NPSH Margin.
b. ANSI/HI 9.6.3 Rotodynamic Pumps – Guideline for Operating Regions.
c. ANSI/HI 9.6.4 Rotodynamic Pumps for Vibration Measurements and Allowable Values.
d. ANSI/HI 9.6.8 Rotodynamic Pumps – Guidelines for Dynamics of Pumping Machines.
e. ANSI/HI 14.1-14.2 Rotodynamic Pumps for Nomenclature and Definitions.
f. ANSI/HI 14.3 Rotodynamic Pumps for Design and Application.
g. ANSI/HI 14.6 Rotodynamic Pumps for Hydraulic Performance Acceptance Tests.

2. Pumps of Same Service Type: Identical in every respect with all parts interchangeable.
3. Design each pump for design conditions listed herein and for operation within the system head curve envelope as appended.
4. Head – Capacity Performance Curve: Continuously rising from runout to shutoff with no points of inflection at any operational speed for stable operation within the AOR.
5. Operate throughout the specified range within the vibration limitations specified herein.
6. Capable of temporary operation at and near shut off head for 30 seconds maximum, against a closed pump check valve as pump starts and stops under the power of the eddy current drive ramping up and down.
7. Capable of handling temporary backflow during cone valve closure.
8. Design and build pumps, motors, eddy current drives, and vibration and temperature monitoring equipment for 24-hour continuous service at all points within the required range of operation, without overheating, excessive vibration or strain.

C. Anchor Bolts:

1. Pump and motor base(s) to be rigidly and accurately anchored into position, precisely leveled and aligned, so that completed installation is free from stress or distortion.
2. Furnish and install Type 316 stainless steel cast-in anchor bolts installed in sleeves**,** plates, nuts and washers under Section 055000 “Metal Fabrications”.
3. Bolt size, arrangement, embedment, and edge distance conforming to recommendations and instructions of Delegated Design Engineer.

a. Anchor bolt configuration and installation in accordance with API RP 686 and ACI 318-08.
b. Stainless Steel Anchor Bolt Nuts: Monel.
c. Anchor Bolt Threads: Apply anti-seize compound of molybdenum disulfide base such as Molycoat G or approved equal.

4. Foundation rails are an acceptable alternate to anchor bolts. A full design shall be submitted during bid to evaluate.

D. The maximum sound pressure level from one pump/motor when operating on utility power measured 3 feet from the equipment and 5 feet above the floor shall be 93 dBA.

E. When operating at any point on performance curve at any point on the performance curve between shutoff and runout at maximum speed, motor shall not exceed nameplate ratings, nor shall design service factor be reduced.

F. Pumping Unit Design Requirements:

1. Pumped Fluid:

   a. Service: Raw Wastewater.
   b. Specific Gravity: 1.0.
   c. Solids Concentration: 0.5 percent maximum.
   d. Temperature Range: 50 to 90 degrees F.

2. Number of Pumps (total (operating/standby)): 6 (4/2).
3. Location: Cedar Creek Water Pollution Control Plant Influent Pump Station.
4. Service: Raw Wastewater (RWW)
5. Pump Equipment Tag Numbers:

   a. P-1.
   b. P-2.
   c. P-3.
   d. P-4.
   e. P-5.
   f. P-6.

6. Configuration: Vertical long coupled (motor separately supported connected to pump with vertical shafting
7. Maximum Design Pump and Motor Full Load Speed (FLS): 600 rpm.
8. Minimum Motor Speed (rpm as percent of FLS): 60 percent.
9. Maximum Motor Rated Power: 700 HP

   a. Non-overloading at any point on pump characteristic curve.

10. Motor Design Voltage/Phase/Frequency: 4160/3/60.
11. Minimum Suction Connection Size: 30 inches.
12. Minimum Discharge Connection Size: 24 inches.
13. Shutoff Head at Motor FLS Acceptable Range: 95 to 110 feet.
14. Factory Test Acceptance Grade for Secondary Operating Point: 1E.
15. Flow Rate at Secondary Operation Point[1]: 18,000 gpm (26 mgd).
16. Minimum Total Head (TH) at Secondary Flow Rate: 35 feet.
17. Minimum Efficiency at Secondary Flow Rate: 60 percent.
18. Maximum NPSHR at Secondary Flow Rate: 26.8 feet.
19. Design Point Flow Rate: 26,000 gpm (37.5 mgd).
20. Design Point TH: 75 feet.
21. Minimum Efficiency at Design Point Flow Rate: 84 percent.
22. Maximum NPSHR at Design Point: 27.7 feet.
23. Factory Test Acceptance Grade for Design Point: 1U.
24. Best Efficiency Point (BEP) Flow Rate Acceptable Range: 35 to 42 MGD.

25.	Minimum Pump Efficiency at BEP:	84 percent.
26.	Factory Test Acceptance Grade for Tertiary Operating Point:	1E.
27.	Flow Rate at Tertiary Operation Point[2]:	31,000 gpm (44.6 mgd).
28.	Minimum Total Head (TH) at Tertiary Flow Rate:	60 feet.
29.	Minimum Efficiency at Tertiary Flow Rate:	76 percent.
30.	Maximum NPSHR at Tertiary Flow Rate:	27.9 feet.
31.	NPSHA[3]:	32.3 feet.
32.	Minimum Diameter Solid Sphere Passing through Pump:	4.5 inches.

Notes:
[1] The secondary operating point is located on the left side of the pump curve to denote the minimum TH, toward pump shut off. The point is specified at FLS with a required flow rate at the minimum specified TH. The point must be in the pump's AOR.
[2] The tertiary operating point is located on the right side of the pump curve to denote the maximum flow rate per pump. The point is specified at FLS with a required TH at the specified minimum flow rate, limited by speed to not exceed 700HP inclusive of drive losses. The point must be in the pump's AOR.
[3] The NPSHR must not exceed the NPSHA at any point on pump characteristic curve.

G. Eddy Current Drives

1. The eddy current drive (clutch) shall be an adjustable speed general purpose magnetic coupling placed between a motor and a load requiring speed control.
2. The eddy current clutch shall be comprised of a rigid frame, constant speed input drum member and an adjustable speed output member for coupling to the pump shafting. The design of the eddy current clutch shall be such that the drive can be easily disassembled for service with a minimum amount of down time. Removal of the motor from the clutch flange adapter plate shall allow the motor and drum to be lifted from the clutch frame for easy access to the internal pilot bearing and other internal components. Removal of other internal drive components shall be further facilitated by not having to remove the clutch frame. The clutch frame shall be open drip proof design and shall support the vertical motor. It shall provide mounting space for the output support bearing housing, terminal box, lifting lugs, and motor flange adapter. Machine guards/bird screens shall be provided for the clutch enclosure.
3. The adjustable speed output rotor shall be of the salient pole design and shall be mounted within and concentric to the smooth inner surface of the drum. The rotor shall be cast of high permeability steel and shall be machined to insure a uniform precision air gap. The pole windings shall be spool wound for ease of replacement of Class H insulated glass magnet wire and wrapped in a protective tape to ensure protection against moisture. The outer rotor shall be supported and held within accurate clearances by means of grease lubricated internal anti-friction bearings. The internal pilot bearing shall separate the input drum and the rotor. The output bearing support housing shall support the weight of the rotating members and shall be suitable for external thrust loading due to intermediate shafting, pump rotating parts, or hydraulic loading. External thrust loading data shall be verified by the pump manufacturer. All bearings should be capable of being lubricated while the drive is in location, from fittings easily accessible on the clutch frame. The output bearing support housing shall also provide for the mounting of the enclosed slip ring and brush assembly. The brushes and slip rings shall be easily accessible through a removable cover plate on the assembly. Each brush of the dual brush assembly for each slip ring shall be capable of handling the current required by the coils. An internal alnico

type AC generator shall be used to provide the speed feedback signal for the controller and tachometer readout.

4. Output end flange shall be NEMA P base design manufactured to fit on the extended shaft connected to the vertical pump. The motor/drive shall be supported by a sub base furnished by the vendor.
5. The vertical adjustable speed drive and motor shall be fully assembled, balanced, and tested at the factory to ensure satisfactory performance. The motor and clutch shall be shipped, handled and installed as a unit.
6. The Eddy Current drive shall include a factory installed NRR, non-reversing ratchet mechanical device capable of preventing reverse rotation of the pump. The NRR and shall have a rotational resistance capacity capable of resisting the reverse rotation forces equal to both the static and dynamic forces of maximum head pressures.

H. Eddy Current Clutch Controller

1. Input rating of the controller shall be 480 VAC +/- 10%, 60 HZ. Output rating of the controller shall be 200VDC, 48A.
2. The controller hardware shall consist of the logic board, the driver board, the output stage and the keypad display. Circuit boards shall be provided with a conformal coating for protection against moisture/humidity, dust, chemicals and temperature extremes.
3. A door mounted, gasketed, keypad display shall be provided. Pulse signals, tachometers, analog voltages and currents shall all be accommodated by use of the programming keypad display. The keypad display shall have a dual role, as a programmer and process variable display. Up to three process variables shall be able to be displayed simultaneously. The keypad shall be common to all controls to simplify programming and maintenance.
4. SCR Paks shall be mounted separately to simplify testing and maintenance.
5. The control shall use surface mount technology and microprocessor control to provide reliability and accuracy. The programming interface shall be intuitive and allow rapid startup for any application. On board programmable PID control shall allow virtually any process to be quickly stabilized.
6. Configurable inputs and outputs shall allow easy interface with computers and other controls.
7. The Eddy Current Clutch Controller shall be installed in a NEMA 12 ventilated steel enclosure with cooling fan and filtered air intake. Enclosure and cooling capacity shall be designed for continuous operation in 40°C ambient air.
8. Control enclosure shall be provided with the following door mounted features:

    a. LOCAL/REMOTE selector switch;

        1) In LOCAL, the pumps can be started and stopped and the speed can be adjusted from the clutch control panel.
        2) In REMOTE, the pumps can be started and stopped and the speed can be adjusted from an external source

    b. START and STOP pushbuttons for motor start and stop.
    c. Potentiometer for speed adjustment. Potentiometer shall have a grooved circular scale from 0 to 100% speed.
    d. Keypad display
    e. Status indicators shall include separate pilot lights for indication of:

1) Motor On – Red.
2) Motor Off – Green.
3) Clutch On – Red.

f. Speed output shall include two (2) 4-20mA signals for local indication and remote indication of motor speed. Panel meter shall be provided on the MSP LCP enclosure for speed indication.

9. Alternately, the controller can be a self contained actuator unit.

2.4 PUMP CONSTRUCTION

A. General:

1. Provide lifting lugs or safety hoist rings on all major equipment/components.
2. All pump components to be interchangeable in pumps of same size.
3. Provide access for maintenance of all pump components.
4. Criteria:

a. Clog free rotodynamic impeller to handle rags, fibrous material, and high solids concentration.
b. High efficiency, low NPSH, large solids passage.

5. Furnish and install mechanical equipment, including electric motors in accordance with applicable OSHA regulations. Provide guards on all rotating assemblies.

B. Casing:

1. Design:

a. Volute type - Single
b. One piece.
c. End suction.
d. Back pullout.
e. Registered fit to mating components.

2. Material: Cast iron, ASTM A48/A48M or Ductile iron, ASTM A536.
3. End Connections:

a. Flanged.
b. Comply with ASME B16.1, Class 125.
c. Configuration: Tangential side discharge or Centerline discharge.

4. Connections: Gauge, cleanout port, prime, air vent, and drain/flush.

a. Face cleanout port in accessible location as shown on the Drawings.

5. Provide hand-hole in casing for access to casing interior and impeller. Inner contours of hand-hole cover to match contours of casing.

C. Back Head:

1. Same material as casing.
2. Cast separate from casing.
3. Shouldered registered fit to casing.
4. Braced and reinforced to provide support for bearing frame.
5. Connection to casing to provide for back pull-out of rotating assembly without disturbing pipe connections.
6. Stuffing box cast integrally with back head and arranged for mechanical seal, with 3/4-inch drilled/tapped connections for seal water and drain.

D. Suction Head (if required):

1. Same material as casing.
2. Cast separate from casing or integral to casing.
3. Shouldered registered fit to casing (for cast separate casing only).
4. Suction wear ring mounted in suction head.
5. The pump suction nozzle size at impeller eye not less than 24”.
6. Provide minimum 6-inch hand-hole in suction head for access to impeller eye. Inner contours of hand-hole cover to match contours of suction head.

E. Impeller:

1. Design:

   a. Enclosed.

2. Material: CA6NM
3. Keyed to shaft with Type 316 stainless steel locknut.
4. Statically and dynamically balanced after assembly.
5. The design of impeller and the shape of vanes for maximum efficiency and to minimize clogging by rags or similar materials.
6. The impeller will have a maximum of four vanes and pass a minimum 4.5-inch solid.

F. Wear Rings:

1. Replaceable hardened 410 or 440 series stainless steel wear rings on impeller and suction inlet.
2. Oriented normal to axis of rotation.
3. Securely fastened with stainless steel set screws
4. Impeller ring hardened to 300 to 375 Brinell
5. Casing ring hardened to 435 to 500 Brinell

G. Pump Shaft:

1. AISI 4340 alloy steel, 4140, or 420 SS dimensioned for full driver power with safety factor, accurately machined over its entire length.
2. Shaft diameter and bearing span selected to avoid lateral and torsional resonances corresponding to run speed and blade pass frequencies.
3. Keyed at impeller end.
4. Provide renewable stainless steel shaft sleeve extending from the impeller hub through stuffing box.

a. Sleeve of Type 316 stainless steel with 32 micro-mesh inch surface finish.
b. Shaft sleeve internally ground for accurate fit to shaft.
c. Positively secure to shaft to prevent relative rotation using "O" rings, packing, Loctite adhesive sealant, or other means. Shrink fit shaft sleeves not acceptable.

H. Sealing:

1. Mechanical Seals:

a. Split mechanical seal.

1) Manufacturers:

a) Chesterton Model 442C.
b) John Crane Model 3740.
c) No substitutions allowed.

2) Self-aligning, split type, single outside mounted mechanical seal equipped with Silicon Carbide stationary and rotating seal faces with SpiralTrac bushing.
3) Four bolt gland design.

b. Seal/Lubrication Water Control and Monitoring System:

1) Provide seal and bearing lubrication water control and monitoring system for each pump as shown on contract drawings.

a) Configure system in accordance with API Plan 32.

2) System designed to provide a flow range of 0.5 through 5 gpm and pressure of 100 psi per pump, with a 3/4-inch water connection.
3) Pressure and flow to be confirmed by the pump manufacturer.

I. Bearing Frame:

1. Cast iron, ASTM A48 of strength and stiffness to support pump operating loads and external load of motor with rigidity to maintain vibration within specified limits.
2. Designed to allow complete rotating element to be removed from casing without disconnecting piping.
3. Rigidly attached to back-head accurately centered with registered shoulder fit.

J. Bearings:

1. Anti-friction ball or tapered-spherical roller type.
2. Inboard radial-load bearing and outboard radial-thrust bearing.
3. Size to carry all loads imposed under continuous operation without overheating.
4. Minimum L-10 Life at Continuous Maximum Load and Speed: 100,000 hours.
5. Lubrication: Grease.
6. Furnish inboard and outboard bearing retainers, water deflectors, and fittings.

K. Pump Base and Sole Plate:

1. Support vertical pump at required height on fabricated steel base plate or base supports cast integrally with volute for support on sole plate that is anchored to concrete foundation.

    a. Support of size, strength, and rigidity to support the weight and operating force of pump and motor and meet specified pump vibration criteria.

L. Suction Elbow with Spool Piece:

1. Suction elbow of cast iron, (ASTM A48, Class 30 or 35) with epoxy coating; 316 stainless steel; or carbon steel with epoxy coating.
2. Spool piece between suction elbow and pump if necessary per process drawings
3. 150 lb standard ANSI flange of specified size to receive suction pipe, reducing to size pump casing suction flange.
4. Handhole with inside face flush with inside contour of suction elbow.
5. Design suction elbow such that headloss through the elbow does not exceed a K-factor of 0.25. Provide the estimated K-factor for the suction elbow.

M. Ancillary Components:

1. Vaned Flow-Conditioning Spool:

    a. Provide vaned flow-conditioning spool piece meeting the requirements shown in the Physical Modeling Report on the suction of all six pumps and project drawings.
    b. Design and manufacture by company specializing in optimization of flow in pumping systems.
    c. Submit certification of qualifications.
    d. Materials: Type 316L A778 welded stainless steel pipe, Schedule 40S.
    e. Number of Vanes: 6.
    f. Length of Each Vane: 48 inches.
    g. Vane Thickness: 0.375 inches.
    h. Vane Height: 12 inches.
    i. Vane Spacing: 60 degrees.
    j. Vane Profile: 45-deg. upstream profile.
    k. Length of Spool: 66 inches.
    l. Diameter of Spool: 48-inch.
    m. Van Stone flat face rings and back up flanges: ANSI 150-lb, type 316L stainless steel.
    n. Hardware: Type 316 stainless steel.
    o. Finish:

        1) Preparation: Bead Blast.
        2) Picked and passivated.
        3) Completely immerse for a minimum of 15 minutes in 10% nitric acid and 3% hydrofluoric acid at 125 degrees Fahrenheit, followed by a neutralizing rinse.

p. Vaned flow-conditioning spool piece to incorporate a 4-inch drain connection with 4-inch 316 stainless steel ball valve and 4-inch 316 stainless steel quick connect.
q. Vaned flow-conditioning spool piece to incorporate 12-inch diameter handhole clean-out with ANSI bolt circle flange, blind flange, and gasket.
r. Vaned flow-conditioning spool piece to incorporate 2-inch diameter threadolet with 6” stainless nipple and ball valve.
s. Provide a signed and sealed drawing including dimensions, weight, welding requirements, material designations, material thicknesses and flange details for review with pump submittal.
t. Manufacturers: Flow Optimizers or equal.

N. Factory Coatings:

1. All surfaces of all pump components (pump, motor, base, couplings, guards) to receive surface preparation, primer, and finish paint in accordance with pump manufacturer’s standard practice.
2. All exterior and wetted surfaces of the pump to be painted with the manufacturer’s standard epoxy.
3. Color: To be selected by Owner.
4. Pump and motors are not to be field painted.
5. Mating flange surfaces and surfaces to be in contact with the concrete grout do not receive paint.
6. Protect nameplates during painting.

2.5 DRIVER

A. Motor:

1. Comply with Section 400593.13 “Medium Voltage Motor Requirements for Process Equipment”.
2. Power Data:

a. Horsepower as specified herein.
b. 4160 Volt, three phase, 60 Hz.
c. Constant Speed (with eddy current drive).
d. Service Factor: 1.15 (constant speed)
e. Pump power not exceeding motor nameplate rating at 1.0 service factor at any point on pump characteristic curve.
f. Motor nameplate stamped Inverter Duty Rated.
g. Starting Method: Reduced voltage auto transformer.
h. Coordinate with Pumps and pump driving motors.
i. Coordinate power factor correction capacitor in accordance with Section 400593.13.

3. Environmental Data:

a. Load Type: Variable torque.
b. Continuous duty, 40 degrees C ambient, 3300 feet maximum elevation.
c. Space Classification: Unclassified

4. Physical Data:

a. Construction and nameplate: comply with Section 400593.13 “Medium Voltage Motor Requirements for Process Equipment”.
b. Orientation/Mounting: Vertical/P-Base.
c. Speed as specified.
d. Enclosure: WPI.

5. Features and Accessories:

a. Winding Temperature Protection: Resistance Temperature Detectors.
b. Space heaters.
c. Cooling fan.
d. Bearing Temperature Monitors: 3 wire RTDs.
e. Bearing Housing Vibration Sensors: Three sensors mounted to a rigid motor component. One measures X, one measures Y, one measures Z.

6. Lubrication Fittings:

a. Bring fittings to the outside of all equipment so that they are readily accessible without removing covers, plates, housings, or guards, and without creating falling hazards.
b. Buttonhead Type.
c. Mounted together wherever possible.
Pressure grease-lubricated fittings: "Zerk Hydraulic" type or the "Alemite" type. Housings of grease-lubricated bearings shall be automatically exhausted to the atmosphere to prevent excessive greasing.

B. Motor Mount:

1. Mount vertical P-Base motor on Eddy Current Drive.

C. Mount vertical motor and eddy current drive on ring base supported by independent foundation above pump.

D. Shafting

1. Manufacturer:

a. Johnson Power Products
b. Watson Spicer
c. Rexnord
d. KTR

2. Solid or hollow shafting of medium carbon steel, supported by independent shaft support bearings.
3. Shafting straight to within 0.001 inch per foot length
4. Each shafting section dynamically balanced including flanges, keys, and bolts.
5. First critical (natural) frequency of shafting to be a minimum of 150 percent above maximum operating speed of driver and pump.
6. U-joint couplings or disc couplings
7. Bottom coupling to pump to provide axial flexibility of shafting.

8. Driver output coupling to shafting fitted with shear-pin hub to allow driver to spin while retaining shaft in place.
9. Provide OSHA compliant galvanized fabricated steel guards for shafting.
10. Shafting joint locations shall be as per Process drawings. No deviation is permitted.

E. Eddy Current Drives:

1. Speed control for variable speed pumps will be Eddy Current Drives
2. Coordinate with pumps and pump driving motors.
3. Include all internal auxiliaries required to meet the functional specifications.
4. Design for a speed range of 60 percent to 100 percent of full load motor speed.

2.6 CONTROLS

A. Refer to control logic in Section 406196 “Process Control Descriptions” for coordination with plant control system.

B. Refer to the P&IDs for I/O signals to plant control system.

2.7 VIBRATION AND TEMPERATURE MONITORING

A. Provide temperature and vibration monitoring accessories with each pump and motor. All detectors, sensors, accelerometers, etc. shall be capable of continuous monitoring, and be completely compatible with the associated temperature and vibration monitoring equipment.

B. Motor stator temperature detectors: six, 100-ohm platinum resistance-type temperature detectors (RTDs) embedded in the stator windings, two per phase, symmetrically installed between stator coils where highest temperature will occur, with leads brought out to a separate terminal box on the motor frame. One set in each phase to be operational and one set spare.

C. Pump and Motor bearing temperature sensors: one per bearing, replaceable, three wire RTDs, having the same resistance as motor stator RTDs, with spring loaded tip, mounted as closely as possible to the outer surface of each bearing with conduit connection head, terminal block, and cabling brought out to a common terminal box.

D. Vibration sensors: Provide integrated electronic piezoelectric accelerometers with 4-20mA communication. Sensors to measure velocity with seismic type transducers that provide output in 0-2 inches/second RMS. Install three sensors for X, Y, and Z axis at motor outboard bearing and two sensors for the X and Y axis at top of pump bearing housing. Sensors shall be Metrix or approved equal. The accelerometers shall be completely compatible with the monitoring equipment specified under Section 407723 “Vibration Monitoring Systems”.

2.8 ACCESSORIES

A. Nameplates:

1. Each major piece of equipment shall be furnished with a stainless-steel nameplate (with embossed data or equivalent) securely mounted to the body of the equipment.

2. Pump Nameplate: At a minimum, include manufacturer's name and model number, serial number, rated flow rate, head, and speed.
3. Motor Nameplate: At a minimum, include manufacturer's name and model number, serial number, horsepower, speed, input voltage, amps, number of cycles and power and service factors.
4. Eddy Current Drive Nameplate: Include manufacturer's name and serial number, input speed, voltage, current and frequency and horsepower at full load.

2.9 FACTORY TESTING:

A. Perform non-witnessed factory hydrostatic test on the pressure-containing components of each pump in accordance with ANSI/HI 14.6, American National Standard for Rotodynamic Pumps for Hydraulic Performance Acceptance Tests, Appendix B – Hydrostatic Pressure Testing prior to shipment.

1. Test pressure not less than 1.5 times pump shut-off head.

B. Perform witnessed factory performance test for each pump as described in ANSI/HI 14.6, American National Standard for Rotodynamic Pumps for Hydraulic Performance Acceptance Tests prior to shipment.

1. Pump hydraulic performance acceptance will be based on factory tests.
2. Perform test for flow rate, total head, overall efficiency and input KW to demonstrate each pump meets ANSI/HI 14.6, acceptance grade 1U for specified design point.
3. Perform testing at pump design point speed. Conform to ANSI/HI 14.6 if alternate test speed is required.
4. If pump fails to meet specification requirements, modify pump and retest.
5. Replace pump that cannot be modified to meet specification requirements.
6. Submit raw and adjusted test data and certified pump performance curves, including total head, flow rate, overall efficiency and total brake horsepower for each pump supplied for approval prior to shipment.
7. Submit NPSHR performance data for pump operating at design speed.

    a. NPSHR performance may be based upon historical testing of similar pump. Submit documentation of historical tests.
    b. If historical NPSHR performance data does not exist, test one pump of each size/rating at design point and maximum flow point speed, head, and flow rate to demonstrate NPSHR performance. Submit complete documentation of test results. If witnessed factory test is determined to be required (and noted above), include the following, otherwise delete. Update the number of test days, trips, etc. for project specific requirements.

8. Performance tests to be witnessed by up to five persons designated by Engineer or Owner.

    a. Notify Engineer in writing at least 21 days in advance of scheduled factory testing of each pump.
    b. Include all witness travel and out-of-pocket expenses in Contractor’s bid to be reimbursed by Contractor to Engineer and/or Owner.

c. Expenses include airfare, automobile, lodging, meals, parking, tolls, taxi and car rental costs.

1) Air travel based upon travel from airport closest to Owner's facility to airport closest to test facility.

9. Schedule witness testing to be accomplished in as short time as possible, and in as few trips as possible.

a. During any trip, time gaps between testing sessions not to exceed 24 hours.
b. If more time than 24 hours is required between testing sessions, provide return trip with at least one week gap for travel time, unless other arrangements can be negotiated.
c. Testing may extend through the weekend if testing sessions will run continuously, but not continue through more than one weekend.

10. Should the hydraulic performance of any component require re-testing, reimburse all witness travel and out-of-pocket expenses as defined above.

C. Provide shop inspection and testing of completed assembly.

D. Owner/Engineer Inspection:

1. Owner/Engineer may inspect any equipment to be furnished under this Section prior to shipment from place of manufacture.
2. Owner/Engineer will notify of equipment components to receive inspection.
3. Make completed pump available for inspection at manufacturer's factory prior to packaging for shipment.
4. Notify Owner/Engineer at least seven days before equipment component available for inspection.
5. Make provisions for both in-person and remote attendance of factory inspections. Remote attendance will be via video conferencing.

2.10 DYNAMIC ANALYSIS

A. Design and arrange all connected rotating components of assembled pumping unit mounted on structural foundation to ensure that neither harmful nor damaging structural vibration resonances or internal lateral or torsional vibration resonances occur at frequencies that may become excited by operation within specified range of speeds.

B. Prior to manufacture, submit certification that dynamic vibration analyses outlined herein have been performed and that the specified vibration limitations will be met.

1. Base dynamic vibration analysis on minimum and maximum operating speeds to satisfy the conditions of operation specified above.
2. Dynamic vibration analyses to be performed by one of the following:

a. Mechanical Solutions Inc. (MSI) of Whippany, NJ.
b. Engineering Dynamics Inc. (EDI) of San Antonio, TX.

3. Perform structural dynamic analysis of combined pump/motor/eddy current drive/extended shaft system including pump foundation and piping out to first pipe restraint or expansion joint.

    a. Base analysis on foundation design shown on Drawings. Do not assume foundation is rigid.
    b. Structural dynamic analysis to predict no first or second bending mode frequencies will exist within a pump speed range from 20 percent below minimum operating speed of 75 to 20 percent above maximum operating speed.

4. Perform lateral rotordynamic analysis of the pump rotating system (i.e., motor rotor, motor shaft, shaft couplings, pump shaft, and impeller) to identify and predict that first lateral critical speed will have a separation margin of at least 20 percent above maximum pump speed or 20 percent below minimum pump speed.

    a. If a design modification (i.e., such as changing shaft diameter) cannot resolve a separation margin deficiency or is not practical, perform a forced damped response analysis to demonstrate that pump will function properly over the speed range.

5. Perform torsional rotordynamic analysis of the complete rotating system (motor rotor, motor shaft, shaft couplings, shafting, pump shaft, and impeller) to identify and predict that no torsional natural frequencies occur within a separation margin extending from 25 percent below to 25 percent above specified pump operating speed range, and no natural frequencies occur within +/- 10 percent of 2x times running speed, line frequency, 2x line frequency, vane pass frequency, and VFD control frequencies (if applicable).

    a. If a design modification (i.e., such as a shaft diameter change or different coupling arrangement) cannot resolve a separation margin deficiency or is not practical, perform a forced damped response analysis to show that infinite life will be achieved with a safety factor of at least two.

6. Prepare and submit Campbell diagrams documenting the structural lateral, rotating component lateral, and torsional analysis results, graphically demonstrating separation margins specified above.

C. Pumps to operate throughout AOR with field measured maximum vibration velocity in inches per second RMS for operating speeds greater than 600 rpm and displacement in mils peak-to-peak for operating speeds 600 rpm or less, in conformance with ANSI/HI 9.6.4, Rotodynamic Pumps for Vibration Measurements and Allowable Values. In addition, for operation in the POR, at the top of the motor the maximum allowable vibration velocity shall be 0.32 ips RMS and maximum allowable displacement shall be 13.5 mils peak-to-peak. For operation in the AOR, at the top of the motor the maximum allowable vibration velocity shall be 0.42 ips RMS and maximum allowable displacement shall be 15 mils peak-to-peak.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Field verify all pertinent data and dimensions to determine exact location and arrangement for equipment to be installed.

B. Verify that items provided by other Sections of Work are ready to receive Work of this Section.

C. Verify layout, orientation and connections.

D. Coordinate with other trades, equipment and systems to the fullest extent possible.

3.2 FIELD QUALITY CONTROL

A. Prior to system startup, submit installation documentation from equipment Manufacturer’s representative attesting that equipment has been properly installed and is ready for startup and testing.

B. Manufacturer Services:

1. In accordance with Sections 014000 “Quality Requirements” and 017900 “Demonstration and Training”.
2. Provide on-site services of manufacturer's representative experienced in installation of equipment provided under this Section.
3. Services include equipment installation, inspection, start-up, field testing and instructing Owner's personnel in operation and maintenance of equipment.
4. Services on-site to meet minimum time requirements listed below. Time requirements do not relieve Contractor of obligation to provide sufficient service to place equipment in satisfactory operation. If there are difficulties in start-up or operation of the equipment due to manufacturer's design or fabrication, provide additional service at no additional cost to the Owner.
5. Installation/Inspection:

    a. 2 days per pump.
    b. Inspect grouting, location of anchor bolts, setting, leveling, grouting, alignment of pump with driver, field erection, connection of piping, electrical and miscellaneous utility connections.

6. Startup/Testing:

    a. 1 day per pump.
    b. Place equipment into operation and make necessary adjustments.
    c. Complete functional and performance testing.

7. Operation and Maintenance Instruction:

    a. 2 days.
    b. Instruct representatives of the Owner on proper operation and maintenance. Provide training agenda and utilize approved O&M manuals.

3.3 INSTALLATION

A. Install pumping units as shown and according to Manufacturer's instructions.

B. Install pumping units in accordance with Manufacturer's setting plans on concrete foundation at elevation to align with piping as shown.

1. Set pump and motor base(s) into final position supported on temporary supports and jack bolts. The use of leveling nuts and shims is prohibited.
2. Grout pump and motor base(s) utilizing expansive, non-shrink, low exothermic epoxy grout system applied according to grout manufacturer's directions to thickness recommended by pump Manufacturer.

    a. Prior to grouting, chip concrete surface to be in contact with grout to present a slightly rough surface and remove laitance. Clean surface of all dust, moisture and oil.
    b. Place a 1 inch minimum diameter by 0.25 inch thick stainless-steel disk, with full radiused edges at each jack bolt contact point bearing on a thin layer of leveling grout.
    c. Grouting to be performed under supervision of Manufacturer's representative

3. Upon completion of grouting, back off jack bolts, and repair edges to present a smooth finish.

    a. Remove and clean jack bolts, coat with grease, and reinsert in jack bolt holes with lock nut to loose fit to bottom of hole.

4. Tighten anchor bolts to torque levels as recommended by Manufacturer.

C. Accurately align piping with pump flanges, without bending and/or twisting, imposing no external loading on the pump. Perform connection piping to pumps in presence of Engineer.

D. Provide and connect power and control conduit and wiring to make system operational and ready for startup.

E. Provide lubricants in accordance with Manufacturer's recommendations.

F. Flush piping with clean water.

G. Make system operational and ready for startup.

3.4 INSPECTION AND TESTING

A. Prior to operating system or components, perform the following:

1. Check pump and motor alignment.
2. Check for proper motor rotation.
3. Check pump and drive units for proper lubrication.
4. Confirm receipt and initial review of first draft copies of all Operation and Maintenance manuals for the pumps and associated system components.

B. Startup and Performance Testing: Upon completion of installation, perform a sequence of inspection, check-out and testing of each pump to assure that all components and systems operate as required. Testing to culminate in a final acceptance test to show full compliance with this Section. Manufacturer's representatives to assist, confirm procedures, participate in inspections, and advise as to interpretation of testing requirements. Testing phases shall consist of the following in sequence:

1. Physical Checkout to include physically inspecting each product or system component individually following installation in the Work to determine that components have been installed as specified and are ready for field and functional testing. Checkout to be in accordance with manufacturer's recommendations and include at a minimum as follows:

    a. Apply electric power to individual components to determine continuity of power supply and signal systems.
    b. Perform pressure and leakage testing of all pressure connections.
    c. Perform dry running tests where possible to confirm rotation and function. Perform a bump test of the motor to verify rotation.
    d. Rotate pump and motor components manually to assure free rotation without evidence of binding.
    e. Verify all bearings are correctly lubricated.
    f. Verify construction is in accordance with approved manufacturer's drawings, and that equipment and all auxiliaries are ready for operation.
    g. Verify that all monitoring, alarm, and shut-down devices function at correct set point and sequence.
    h. Perform preliminary tests of the bearing monitoring system furnished under this Section.
    i. Perform all inspections specified in Section 400593.13 "Medium Voltage Motor Requirements for Process Equipment".

2. Field Testing: Once flow can be allowed through the pumps, perform field tests by operating each pump individually to make all corrections and adjustments required for initial operation. Operate each pump in manual control and simulated remote automatic control, utilizing local control panel.

    a. Submit written test procedures 30 days prior to testing, including a sample test data log sheet.
    b. Upon completion of testing, submit a written report tabulating equipment tested, test results, problems encountered and corrective action to be taken within two weeks after test completion.
    c. Following start-up operation, conduct performance test of each pump including motors, couplings, shafting, and eddy current drives to demonstrate equipment generally conforms to specified operating conditions. Factory testing specified above will be the basis of performance acceptance. If pump performance does not generally agree with factory test results, perform corrective measures or remove and replace with a pump that satisfies specified conditions.

        1) Obtain pressure readings (or wet well level readings) from installed or Contractor furnished pressure gauges and level monitors. Install tapped holes in pipes for pressure gauges if no usable taps available.
        2) Obtain flow readings from installed flow meter, timed fill and draw, or Contractor provided temporary flow meter.

3) Utilize metering equipment located in motor controls or hand-held to obtain motor power draw.
4) Provide a portable tachometer to obtain pump speed.

d. Continuously monitor pump operation to verify pump operates without vibration, jamming, leakage or overheating and to perform specified functions.
e. Simulate operation as close as possible to design point and other specified operating points.

1) For variable speed application, confirm pump performance at three reduced speeds corresponding to: 75 percent**,** 50 percent, and 25 percent of design point flow, unless otherwise defined herein. Period of operation at Engineer's discretion.

f. Record data on approved log sheets at 15 minute intervals. Include at least suction and discharge gauge readings, flow, pump speed, wet well level, power supply voltage and amperage, power, power factor, and all other information necessary to calculate pump performance characteristics.
g. Verify that primary monitoring devices (vibration and temperature) are transmitting information to their receivers. Simulate alarm conditions as possible to verify that alarms will function. Make final adjustments necessary to place equipment in satisfactory working order.
h. Perform a preliminary vibration test on each pump utilizing a hand-held vibration detector, to verify that overall vibration velocity and displacement is within the acceptance criteria of ANSI/HI 9.6.4. Measure horizontal, vertical, and axial vibration at upper portion of pump bearing housing and at both motor bearing housings. Record preliminary vibration readings.

i. Vibration Signature Test:

1) Upon completion of startup and performance testing, retain an independent mechanical testing and analysis firm staff member with a minimum level III qualified vibration technician as defined by Vibration Institute or equivalent to perform a detailed vibration signature analysis of each pump and motor in accordance with ANSI/HI 9.6.4:

a) Mechanical Solutions Inc. (MSI) Whippany, NJ.
b) Engineering Dynamics Inc. (EDI), San Antonio, TX.
c) Pre-Approved Equal.

2) Perform a detailed X-Y-Z vibration signature analysis of each pump and motor.
3) Perform experimental modal analysis to identify potential resonant frequencies.
4) Operate each pump at full speed, lowest speed, and at a maximum 5 percent increments between minimum and full speed. Select speed(s) corresponding to potential vibration conditions if any exist.
5) Measure horizontal, vertical, and axial vibration at upper portion of pump bearing housing and both motor bearing housings.

6) Prepare and submit a written report including a sketch of the pump, indicating thereon where and the direction in which the vibration signatures were taken and recorded.
7) Report vibration profiles as plots of vibration spectra showing displacement and velocity versus frequency.
8) Demonstrate compliance with specified overall vibration velocity and displacement allowable values for pump in accordance with ANSI/HI 9.6.4 and for motor in accordance with allowable values listed above.
9) Demonstrate there are no field installed resonant conditions caused by misalignment, foundation or connecting piping and pipe supports when operating at any speed within the specified operating range including a 10 percent separation margin above the maximum pump speed and 10 percent separation margin below the minimum pump speed.
10) Prepare and submit a written report including the following:

    a) Sketch of pumps and motors indicating location and direction of vibration measurements.
    b) For each test point: (a) peak to peak displacement, in mils, (b) frequency, (c) peak filtered velocity level in inches per second, (d) overall velocity level in inches per second RMS.
    c) A complete analysis of findings, any issues encountered, probable causes, and specific recommendations for corrective actions.

11) If pump system is furnished with vibration and temperature monitoring system, use measurements obtained from temporary surface mounted vibration sensors mounted in vicinity of installed sensors to confirm accuracy of permanently installed system.

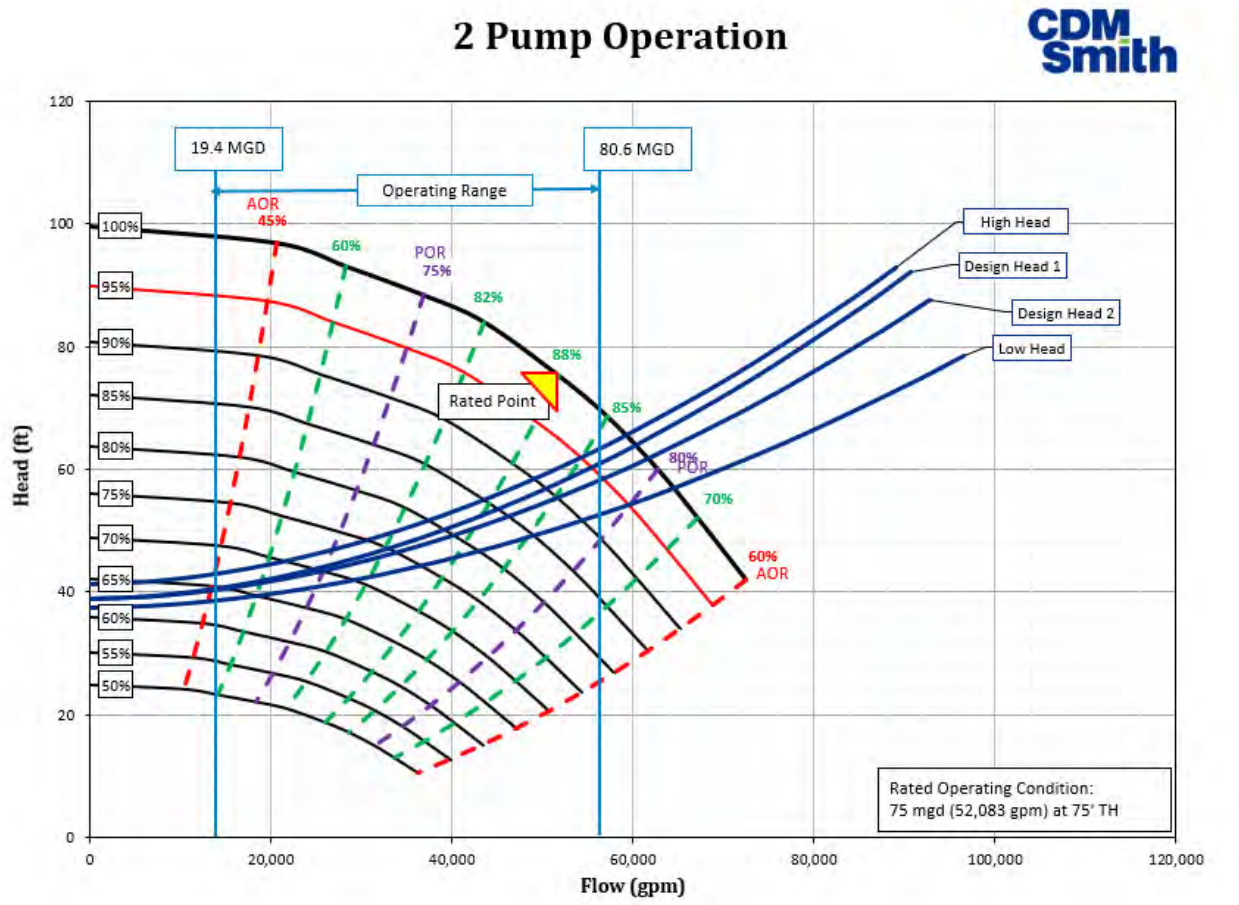
3. Functional Test: Perform in conjunction with testing of control systems.

    a. Operate each pump under remote automatic control based upon level monitoring system and control, operating each pump as lead pump.
    b. Obtain plant data recorder records throughout duration of test of wet well level and flow rate, and any additional information pertinent to operating protocol of pumping system.
    c. Submit final test results demonstrating proper control of pumps to maintain level. Test duration to be 24 hours.

4. Acceptance Test: Final stage of testing to demonstrate pumping system functions fully automatically as specified.

    a. Demonstrate equipment is properly installed, connected, and aligned, is free of damage and mechanical defects, and operates without overheating, vibration, noise, or overloading.
    b. Duration of test an elapsed time of fourteen days, operating as continuously as possible, switching the lead pump daily.
    c. Should any pump fail during the acceptance test, perform repairs/adjustments and initiate a new acceptance period.

C. Equipment Acceptance:



1. Adjust, repair, modify, or replace components failing to perform as specified and rerun tests.
2. Make final adjustments to equipment under direction of manufacturer's representative.
3. If any equipment fails to fulfill the specified performance, perform corrective measures and retest or replace to assure full compliance with Specifications.
4. Furnish installation certificate from equipment manufacturer's representative attesting that equipment has been properly installed and is ready for startup and testing.

Appendix A Valve Pre-Purchase Contract/Proposal

DRAFT

Request for Proposal (RFP)

Valve Procurement for the Cedar Creek Water Pollution Control Plant (WPCP)

Influent Pumping System Project

Introduction

Nassau County, New York (County) is currently seeking proposals from qualified manufacturers and entities authorized to do business in the State of New York, to provide twenty-three (23) valves to the County's Department of Public Works. The services include but are not limited to, development of fabrication shop drawings, O&M manuals, fabrication, testing, extended warranty, delivery, and commissioning coordination with the installing contractor as described herein, to the Cedar Creek WPCP.

The purpose of this proposal is to pre-purchase the valves that are critical to the functionality of the Influent Pump Station and that have the potential for long delivery times. The pre-purchase will reduce contractor risk and potential for delay of the Cedar Creek WPCP Influent Pump Station Improvements project.

Anticipated Proposal Schedule

RFP Issue Date: ……TBD
Proposal Conference: …… TBD
Deadline for Questions: ……TBD
Proposal Due Date: …… TBD

Dates indicated above are subject to change at the sole discretion of the County.

THE PROPOSER SHOULD PROVIDE A PROPOSAL THAT MEETS THE SCOPE REQUIREMENTS SET FORWARD HEREIN. THE COUNTY WILL REVIEW SINGLE OR MULTIPLE PROPOSALS FROM AN ENTITY.

Scope of Services

The Scope of Services (Scope) outlined herein has been established for the purpose of procurement of twenty-three (23) valves for installation by others under the Influent Pump Station Improvement Contract. During design development of the Influent Pump Stations Improvements Contract, it was determined that several pieces of equipment have long procurement timelines. These long timelines may have the potential to interfere with the estimated construction sequence and schedule, and thus have been recommended for purchase directly by Nassau County DPW.

The proposer shall present the cost for the shop drawing development, fabrication, factory testing, O&M manuals, delivery, commissioning coordination with the installing contractor, and extended warranty for fifteen (15) knife gate valves with electric actuators, and eight (8) resilient wedge gate valves with electric actuators, stem extensions, and supports for installation under a separate contract. The schedule of valves is included in the Construction Contract Documents. The proposer shall submit fabrication shop drawings and O&M manuals for review and approval by the County and its Engineer. The proposer shall assume up to three rounds of comments on the fabrication shop drawings and O&M manuals.

DRAFT

The valves shall be delivered to the Cedar Creek WPCP located at 3340 Merrick Road, Wantagh, NY 11793.

The valves will be offloaded for long term storage by the Owner or its designee. The Owner and installing Contractor will be responsible for storage prior to installation. The proposer shall identify the long term storage requirements for the valves, including but not limited to, temperature control requirements, power, or frequency of exercising the valves. The valves may be in storage for up to four (4) years depending on the approved construction sequence from the installation Contractor.

The included specifications and plans are to be used to pre-qualify and purchase a total of twenty-three (23) electrically actuated valves of various sizes for installation by others in order to meet project construction deadlines. For purposes of this pre-purchase agreement, language that states (Contractor" shall be determined to mean "Proposer".

Contract Term

It is the intent to award the contract for a 55-month period. The shop drawing review and procurement phase is anticipated to be twelve (12) months, including four (4) months for fabrication shop drawing development through approval from the Engine (with up to three review cycles), followed by a fabrication duration anticipated to be eight (8) months.

Compensation for the scope of services shall be on the basis of lump sum.

At any time during the term of this Agreement, the County may, in its sole discretion, require the Proposer to perform Extra Services. The Proposer shall not perform, nor be compensated for, Extra Services without the prior written approval of the Commissioner or his or her duly designated deputy.

EXECUTIVE SUMMARY

A physical model study of the Cedar Creek WWTP Influent Pump System was conducted. A 1:6.85 scale model was constructed, and tests were conducted to determine the nature and severity of any adverse hydraulic conditions that may affect pump or cleaning performance.

Baseline testing indicated that the trough baffles installed in each wet well were effective at eliminating air entrainment into the pumps across all operating conditions. Given the orientation of the trough baffle openings, however, concentrated influent flow did not re-distribute vertically downwards. This resulted in overall vertical circulation within the wet well and unstable conditions entering the pumps. This instability was more pronounced with more pumps in operation but as pumps were taken offline conditions improved. The more stable conditions within the wet well allowed for organized surface vortices to form. These vortices were infrequent but intermittently organized into a well-organized, air entraining vortex that entered into each pump. Conditions entering the suction piping remained unstable. Frequent flow oscillations and wrapping were observed in the horizontal suction piping approaching the reducing elbows. Once through the elbows, conditions remained unstable passed the pump suction flange. Overall, pre-swirl was elevated and unstable with frequent stalling and burst swirl observed in each operating conditions.

A series of six (6) flow straightening vanes were installed in the suction piping supplying each pump and were effective at stabilizing flow at the pump suction flange. With vanes installed, strong surface vortex activity was still observed. A series of four (4) horizontal beams were installed in the wet well and were effective at eliminating all surface vortex activity and stabilized overall conditions within the wet well. With modifications installed, pre-swirl was low and stable. Velocity and turbulence variations were within criteria across the full range of expected operating conditions. Additional testing was conducted with the plant drain extended to El. (-) 21.30 ft in the wet well and was in operation at 14.16 MGD. Flow entered the wet well under the water surface, which prevented air entrainment and surface oscillations from occurring. Additionally, there was no change to approach conditions with the plant drain in operation, and stable conditions were observed at the pump suction flange. Given the orientation of the horizontal beam installed above Pump 3, extending the plant drain down resulted in interference between the beam and the piping. Removing this beam allowed for surface vortices to organize while operating Pump 3 at a runout flow. The horizontal beam was re-installed in a revised location which eliminated the surface vortex. The revised beam locations remained effective at eliminating surface vortex formation for all remaining conditions. Additional testing was conducted with a 48-in x 36-in reducing elbow and a 36-in x 30-in reducer positioned after the elbow for Pump 1. The additional testing showed similar results to previous testing, with pre-swirl low and stable and velocity and turbulence variations within HI criteria.

It is recommended that flow straightening vanes be installed in the suction piping supplying the pumps. A series of four (4) horizontal beams should be installed in each wet well. The plant drain should be extended to El. (-) 21.30 ft. The recommended modifications can be seen in Figures 5-1 through 5-2.

1.0 INTRODUCTION

1.1 Background

Verdantas Flow Labs is conducting a physical hydraulic model study of the Nassau County – Cedar Creek Influent Pump Station. The intake currently houses three 60-mgd pumps, two 30-mgd pumps, a single 12-mgd pump, and a single 4-mgd pump. The pumps are housed within two identical rectangular wet-wells that are each supplied via 84-in influent pipes. Currently there is no interconnectivity between the wet-wells; however, one of the larger 60-mgd pumps is capable of taking flow from both wet-wells. The proposed upgrades involve removing all existing pumps and installing six new pumps, each rated at 37.5 MGD. The new extended shaft pumps will utilize some of the existing suction piping that is currently in place. The new orientation will have three pumps on each side of the wet well with a new wet well interconnect line to connect the two wet wells.

The model was used to evaluate the hydraulic conditions within the intake and to determine any adverse hydraulic phenomena that may exist within the intake. In addition, the model was used to develop recommended modifications to remediate any adverse hydraulic phenomena, which could impact pump performance.

1.2 Objectives

The objectives of this model study were as follows:

- Evaluate the performance of the intake structure to determine if any potential problems may exist with the approach flow hydraulics that may adversely impact the performance of the pumps.

- If necessary, develop modifications to the design or implement corrective measures that would mitigate or eliminate problems associated with the adverse approach flow.

- Test and document the approach flow conditions in the sump with the final recommended modifications in place.

1.3 Sump Hydraulics & Pump Problems

The pump manufacturer typically develops pump curves at the manufacturing facility. The head-flow curves, efficiencies, net positive suction head, and power requirements are usually determined by conducting a pump test with the actual prototype pump or a geometrically similar model. This pump test is conducted in a controlled environment with uniform approach flow to the pumps. Therefore, to ensure that the pump will perform as tested at the manufacturing facility; the prototype field installation must also have similarly uniform approach flow conditions.

Failure to provide uniform approach flow hydraulics can result in pump performance that differs significantly from that predicted from the performance curves. The pump may not operate at its best efficiency point, flow or head may be less than expected, power requirements may vary, and if the approach flow conditions vary enough, significant damage could occur to the pump itself.

Pump intakes are often designed to adhere to the 2024 Hydraulic Institute Standards (ANSI HI 9.8-2024). A consortium of pump manufacturers, engineers, and end users developed these standards. Failure to adhere to these standards can lead to a number of problems including air entrainment, vortex activity, skewed velocity distributions and turbulence at the pump impeller. Research has shown that these conditions can lead to fluctuating loading on pump impellers, vibration, cavitation, and decreased flow and efficiency (Sweeney and Rockwell 1982).

Following the HI standards helps to minimize adverse approach flow conditions within the pump sump. However, the standards were developed for pumps with individual capacities of 40,000 gallons per minute (gpm) or less for vertical pumps, 20,000 gpm or less in trench type wet wells, 7,000 gpm or less for "can" pumps and 5,000 gpm or less for pumps in circular wet wells. When dealing with pumps that exceed these capacities, or overall station capacities in excess of 100,000 gpm, it is necessary to utilize physical and numerical modeling techniques to investigate the hydraulic conditions within the sump.

Physical models are used to evaluate the level of temporal velocity fluctuations, or turbulence, within the pump bell. Changes in pressure are directly related to changes in velocity. Therefore, velocity fluctuations, whether temporal, or as a result of skewed approach flow, can cause pressure fluctuations on the pump impeller. These pressure fluctuations translate into a loading imbalance on the pump shaft, possibly causing vibration or pre-mature bearing wear.

Physical models are also used to evaluate the uniformity of the flow within the pump bell. Should more flow be traveling down one side of a pump bay than the other, such as that which occurs when there is flow separation at the bay entrance, the velocity may be higher on one side of the impeller or the other. This may cause pre-swirl of the flow entering the pump. Depending on the direction of the pre-swirl relative to the pump rotation, this may cause the pump to consume more or less power than anticipated, resulting in the pump operating at a point other than its best efficiency. The pre-swirl may also result in the flow hitting the impeller blade at an angle of attack other than what it was designed for. This can result in localized flow separation on the impeller. These separation zones can cause low-pressure regions, which result in localized areas of cavitation.

Vortices are another hydraulic phenomenon with which physical models are used to identify and eradicate. Vortices are localized regions of high velocity swirling flow. The velocity at the core of a vortex can be high enough that the pressure falls below the vapor pressure of the fluid. If the vortex forms below the surface, it is called a submerged vortex and can result in vapor being pulled out of suspension. If it forms as a surface vortex, it can pull a vapor core into the pump. Either of these vortices can result in air entrainment or cavitation within the pump. Depending on the system, this entrained air may be able to accumulate within the downstream piping network, possibly causing damage to other system components. The low-pressure core of a vortex can also lead to localized cavitation, noise, decreased pump capacity, and vibration.

Numerical modeling of pump sumps is a relatively new approach to investigating wet-well hydraulics. The ability of numerical models to predict the general flow patterns within the sump is constantly improving. However, numerically modeling highly mobile surface vortices presents a challenge. Research is constantly being conducted to improve the ability to numerically predict mobile vortex activity. However, at the present, physical models remain the only method available to reliably simulate mobile prototype vortex activity.

2.0 MODEL SCALING AND ACCEPTANCE CRITERIA

2.1 Model Scaling

To obtain accurate results from a physical model study, there must be dynamic similitude between the model and the prototype. To satisfy this requirement, there must be exact geometric similitude. In addition, the ratio of the dynamic pressures must also be maintained. Strictly satisfying dynamic similitude requires a 1:1 scale model. This is usually not feasible, so some compromise is made. To accomplish this, geometric similarity is maintained, and the dominant forces associated with the prototype are determined and maintained between the model and prototype.

The primary forces that affect fluid flow are viscosity, surface tension, velocity (inertial), pressure, gravity and elastic forces. In structures with a free surface, such as a pump intake, gravitational and inertial forces are far greater than the viscous and turbulent shear forces. Therefore, when modeling free surface structures, geometric similarity and the ratio of inertial to gravitational forces, or the Froude number, is maintained between the model and prototype.

Simply holding the Froude number constant violates the strict definition of dynamic similitude. However, if the model is operated within a high enough range of Reynolds numbers, viscous and surface tension scale effects may be minimized. The 2024 ANSI-9.8 Hydraulic Institute Standards recommends that the minimum Reynolds number at the pump inlet be greater than 6×10^4. Therefore, when choosing the model scale, it is necessary to ensure that the scaled flow rate will result in a high enough Reynolds number to minimize scale effects. It is common to be conservative and select a scale that results in a Reynolds number closer to 1×10^5.

Upon selecting an appropriate model or length scale, it is possible to determine relationships such as velocity, flow, and pressure between the model and prototype. This is accomplished by setting the model and prototype governing equations equal to one another. As mentioned above, the governing equation is determined by evaluating the dominating forces. These equations are typically dimensionless numbers such as the Froude, Reynolds, Weber, Euler, or Mach numbers. These common modeling relationships are shown below:

$$\textit{Froude Number} \qquad F = \frac{U}{\sqrt{gL}} = \frac{\textit{Inertial Force}}{\textit{Gravity Force}} \tag{2-1}$$

$$\textit{Reynolds Number} \qquad Re = \frac{UL}{\nu} = \frac{\textit{Inertial Force}}{\textit{Viscous Force}} \tag{2-2}$$

$$\textit{Euler Number} \qquad E = \frac{\rho U^2}{\Delta P} = \frac{\textit{Inertial Force}}{\textit{Pressure Force}} \tag{2-3}$$

$$\textit{Weber Number} \quad W = \frac{U}{\sqrt{\sigma/\rho L}} = \frac{\textit{Inertial Force}}{\textit{Surface Tension Force}} \tag{2-4}$$

$$\textit{Mach Number} \quad M = \frac{U}{\sqrt{K/\rho}} = \frac{\textit{Inertial Force}}{\textit{Compressive Force}} \tag{2-5}$$

Where:

U = characteristic velocity
g = gravitational constant
L = characteristic length
ρ = fluid density
ΔP = pressure difference
ν = kinematic viscosity of the fluid
σ = surface tension of the fluid
K = bulk modulus of elasticity of the fluid

If the governing equation is held constant between the model and prototype, the corresponding model flow rate, velocity, pressure, etc., can be solved directly. For example, setting the Froude number of the model equal to the prototype yields the following relationships, where the subscripts *p* & *m* denote prototype & model, respectively:

$$F_P = F_m \tag{2-6}$$

$$\frac{U_p}{\sqrt{gL_p}} = \frac{U_m}{\sqrt{gL_m}} \tag{2-7}$$

Using equation 2-7, the model velocity, and therefore, the flow rate Q can be solved for if the prototype velocity and length ratio is known. Typically, the model parameters are solved for based on the prototype to model length ratio, L_P/L_M, or L_R. Doing so yields the following equations for Q & U:

$$\frac{Q_p}{Q_m} = \mathrm{L}_\mathrm{R}^{5/2} \tag{2-8}$$

$$\frac{U_P}{U_M} = \sqrt{\mathrm{L}_\mathrm{R}} \tag{2-9}$$

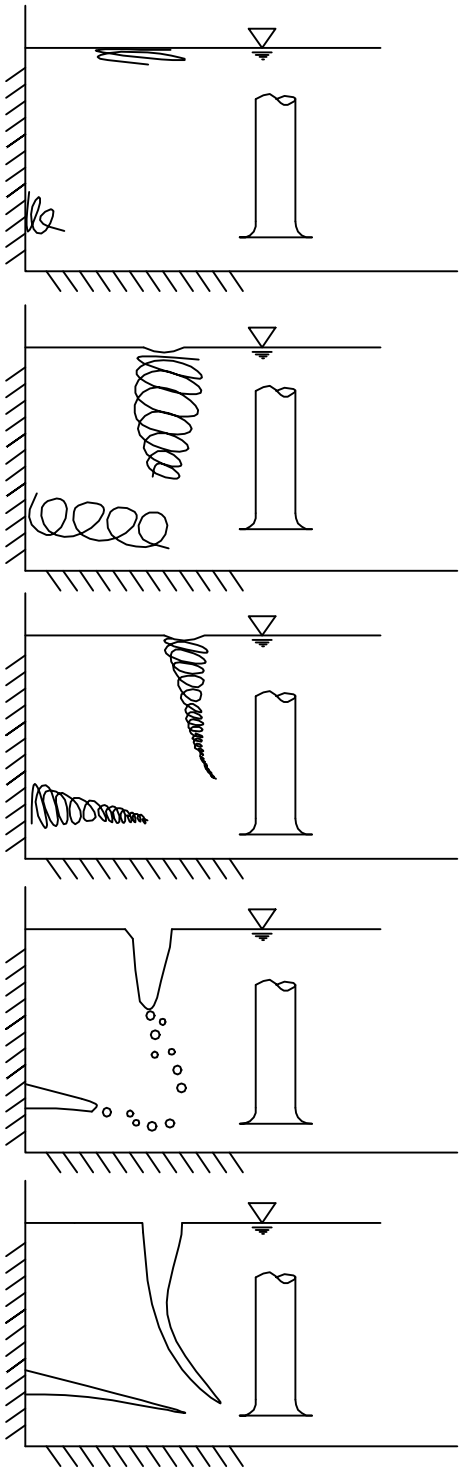
Using these equations, it is possible to determine the flow rates at which the model should be operated. The Cedar Creek WWTP was constructed at a 1:6.85 scale. The Reynolds number at the

pump suction flare when operating at 37.5 MGD, is on the order of 1.0×10^5 with a resulting Weber number of approximately 700. All values exceed Hydraulic Institute scaling criteria.

2.2 Acceptance Criteria

In addition to choosing an appropriate scale with which to construct the model, it is important to evaluate the performance of the model against a set of pre-determined acceptance criteria. The criteria used for this model study closely follow those suggested in the 2024 Hydraulic Institute Standards and are as follows:

- No organized free surface or submerged vortices greater than a Type 1 (general rotation) should be permitted at Froude scaled flow rates. The HI standards suggest that a Type 3 vortex may be allowed to enter the pump if it occurs infrequently, such as less than 10-percent of the time; however, it is the goal of this study to eliminate any vortex greater than a Type 1. (note: these are based on Figure 2-1 below)



- Pre-swirl should be less than 5-degrees at the pump impeller location

- Time averaged velocities within the pump throat should not deviate more than 10 percent of the cross-sectional area average velocity.

- Time-varying velocity fluctuations (turbulence) at a point within the pump throat should be less than 10 percent.

Vortex activity is evaluated qualitatively. The Hydraulic Institute Standards suggest using a scale of 1 to 6 to rank the severity of a vortex. A scale of 1 to 5 was utilized for this study, with a Type 1 being the least severe and a Type 5 being the most severe, pulling air and trash into the intake. HI varies slightly by ranking a vortex that pulls trash into the intake as a Type 5 and one that pulls air as a Type 6. However, since the acceptance criteria do not permit vortices greater than a Type 1, this variation of the HI scale does not have any effect on the outcome of the model study. Figure 2-1 presents a graphical representation of the vortex ranking used in this study.

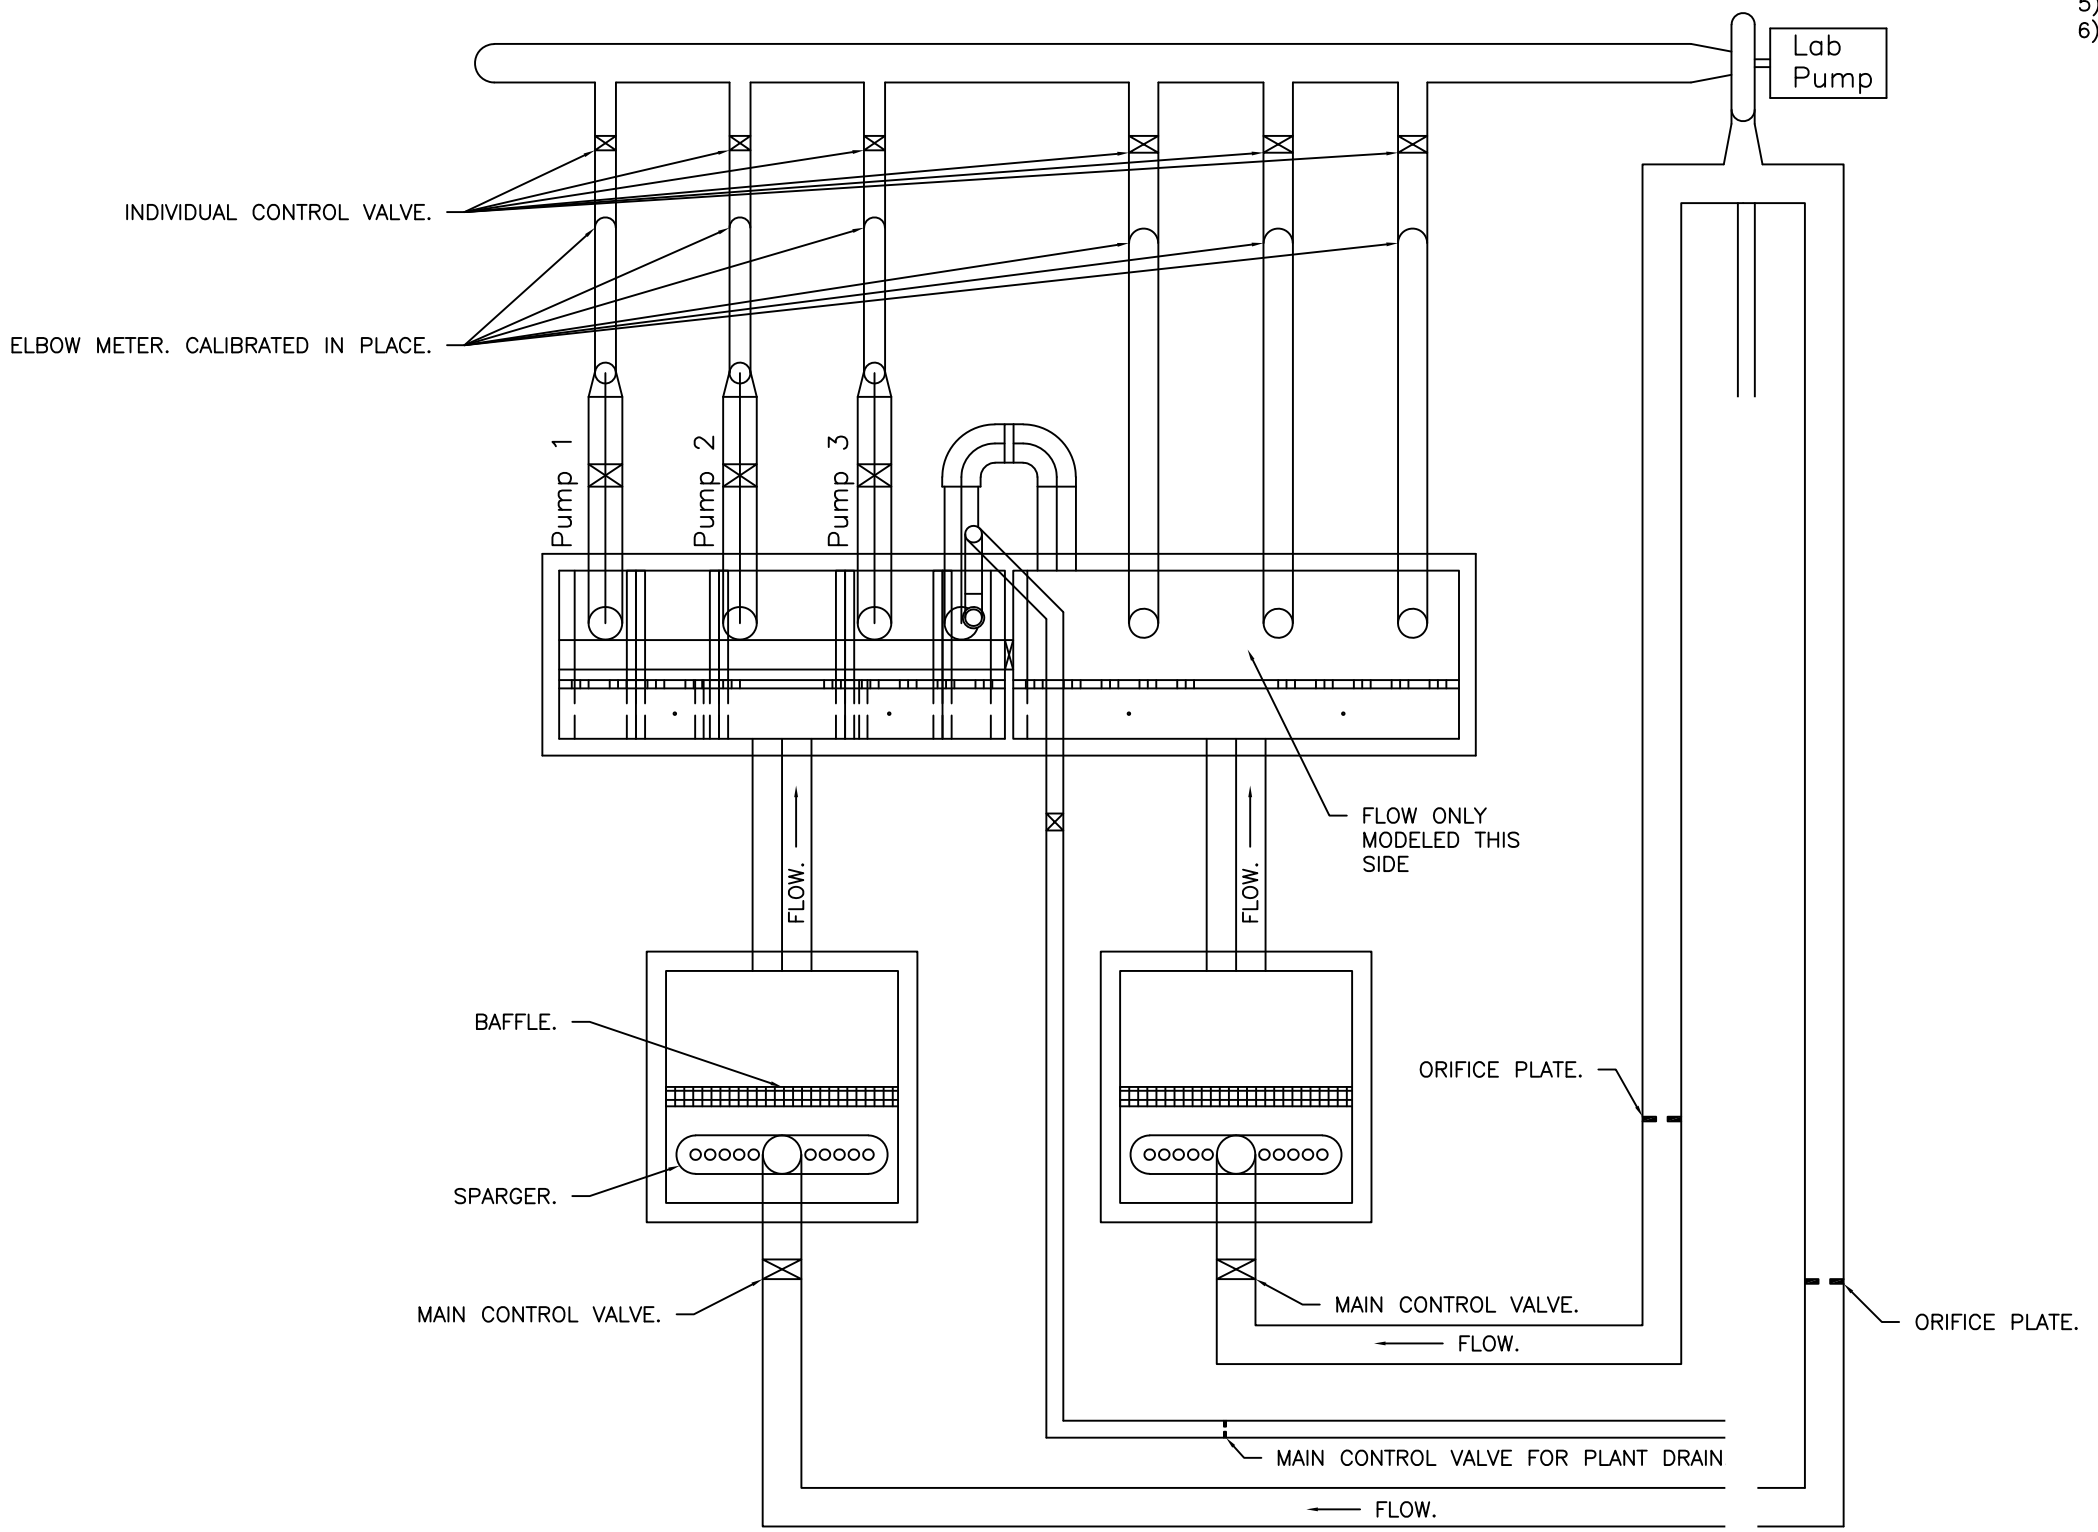
3.0 THE MODEL

3.1 Model Boundaries

When evaluating the portions of the pump station that are to be included in the model, it is necessary to include any components that could affect the approach flow to the pumps. This is first determined by evaluating the upstream and downstream controls. In this application, an upstream hydraulic control is a structure or component that controls the downstream flow. This may be a change in grade that results in critical flow, a sluice gate or opening that directs the flow, or simply a long stretch that results in uniform flow conditions.

The Cedar Creek WWTP receives flow via two (2) 84-in influent pipes. A portion of the length of these influent pipes were included in the model and served as the upstream model boundary. The pump intake consists of two wet wells that are connected via a interconnect line. There are six (6) pumps in total, with each wet well housing three (3) pumps. The full internal geometry of one wet well was included in the model and simulated in detail. In addition, three (3) pumps were included in the model and simulated in detail. The remaining pumps were not modeled in detail but were simulated through withdrawn flow only to simulate accurate crossflow into and out of the adjacent wet-well (simulated in detail).



Physical model studies are used to evaluate the approach flow and ensure that the flow is uniform up to the pump impeller. Therefore, the downstream model boundary was chosen as the entrance to the pump impeller. It is not necessary to include a model pump impeller because the pump performance is tested at the manufacturer's facility. The manufacturers test was conducted with uniform approach flow conditions. Therefore, with other design considerations being equal, if those conditions can be duplicated in the prototype structure, the performance of the pump in the field should match that determined by the manufacturer.

3.2 Model Construction

The model was constructed on a raised deck to facilitate viewing and data collection. The model head box, floor, and sidewalls were constructed with waterproof wood. The model pumps, intake piping and pump bells were fabricated out of clear acrylic up to the impeller location. The additional piping was fabricated out of PVC pipe. Friction losses within the model limits are negligible when compared to form or boundary losses. Therefore, it is assumed that materials mentioned above were appropriate for model construction.

The overall model basin was constructed with a tolerance of +/- 0.25 model inches. The model pump throats were constructed to within +/- 0.06 model inches. Valves were used to control the individual pump flows as well as the total model flow. A pump was installed downstream of the model pumps to re-circulate flow back to the model head box. Flow straightening devices were installed in the model head-box to ensure that flow entering the head box was uniform. The following figures and photos show the model.

4.0 INSTRUMENTATION AND TESTING PROCEDURES

4.1 Instrumentation and Data Collection

The individual model pump flow rates, as well as the total model flow rate were determined with an ASME standard orifice meter with an accuracy of +/- 2 percent or better. U-tube manometers were used to measure the manometer deflection. Valves were adjusted in the model piping until the manometer deflections indicated that the proper flow rates were set.

The water levels in the pump sump were recorded with a staff gauge referenced to the sump floor with an accuracy of 3-mm (0.01-ft) or better. Vortex formation was visually observed. Dye was used to aid in the visualization of vortex formation. Vortex strength was rated according to the scale presented in Figure 2-1. Digital photographs and video footage were also used to document vortex formation.

Velocity fluctuations and turbulence levels were measured just upstream of the pump bell. A free spinning miniature propeller Model 412 Nixon Streamflow probe was used to measure the velocities. A data acquisition board was connected to the Nixon probe and recorded approximately 9000 samples over a 30-second period. The software program HPVEE was used to record this data and determine the mean and standard deviation of the velocity data. The pump bell was attached to a turn-column, which allowed the velocity probe to be rotated 360 degrees. Velocities were collected at eight (8) points around the pump bell, at a fixed radius, in 45-degree increments.

A swirl meter was installed in each detailed pump to measure the level of pre-swirl of flow entering the pump. Each swirl meter consists of four (4) straight vanes mounted on a shaft. The swirl angle can be calculated with the following equation:

$$\theta = \tan^{-1}\left(\frac{\pi dn}{u}\right)$$

Where: u = average axial velocity
d = diameter of the pipe in which the swirl meter is installed
n = revolutions per second of the swirl meter

4.2 Test Program

Testing is conducted in three phases, baseline, modification, and final documentation testing. Each of these phases is described below:

- Baseline Testing: Tests were conducted with the proposed intake structure. These tests were conducted to evaluate the approach flow conditions, and to determine if any

adverse hydraulic phenomena were present. In general, vortex activity, pre-swirl, velocity distribution, turbulence levels, and overall approach flow conditions were evaluated.

- Modification Testing: Tests were conducted to develop modifications that would alleviate or minimize any potentially damaging hydraulic conditions within the sump. These tests were conducted systematically to minimize design changes while still meeting the pre-determined acceptance criteria.

- Final Documentation Testing: Following review of the draft report and any witness testing, documentation testing may be conducted to verify that the recommended modifications are effective for a range of expected operating conditions.

5.0 TEST RESULTS

5.1 Baseline Testing

Baseline tests were conducted with several possible operating conditions. These tests are conducted at varying water levels and pump operating combinations. In general, the following observations were made:

1. Baseline testing indicated that the trough baffles installed in each wet well were effective at eliminating air entrainment into the pumps across all operating conditions.
2. Given the orientation of the trough baffle openings, however, concentrated influent flow did not re-distribute vertically downwards. This resulted in overall vertical circulation within the wet well and unstable conditions entering the pumps. This instability was more pronounced with more pumps in operation but as pumps were taken offline conditions improved.
3. The more stable conditions within the wet well allowed for organized surface vortices to form. These vortices were infrequent but intermittently organized into a well-organized, air entraining vortex that entered into each pump.
4. Conditions entering the suction piping remained unstable. Frequent flow oscillations and wrapping were observed in the horizontal suction piping approaching the reducing elbows. Once through the elbows, conditions remained unstable passed the pump suction flange.
5. Overall, pre-swirl was elevated and unstable with frequent stalling and burst swirl observed in each operating conditions.

A summary of the baseline testing is shown in Table 5-1

Table 5-1 Baseline Data Summary

Note: A velocity probe was installed in Pump 1 for all tests (See Figure 3-1 for pump notation). Pre-swirl meters were installed in all pumps. Velocity fluctuations should be less than 10%, pre-swirl should be less than 5.0-degrees and no vortices greater than Type 1 or weak type 2 should enter the pump.

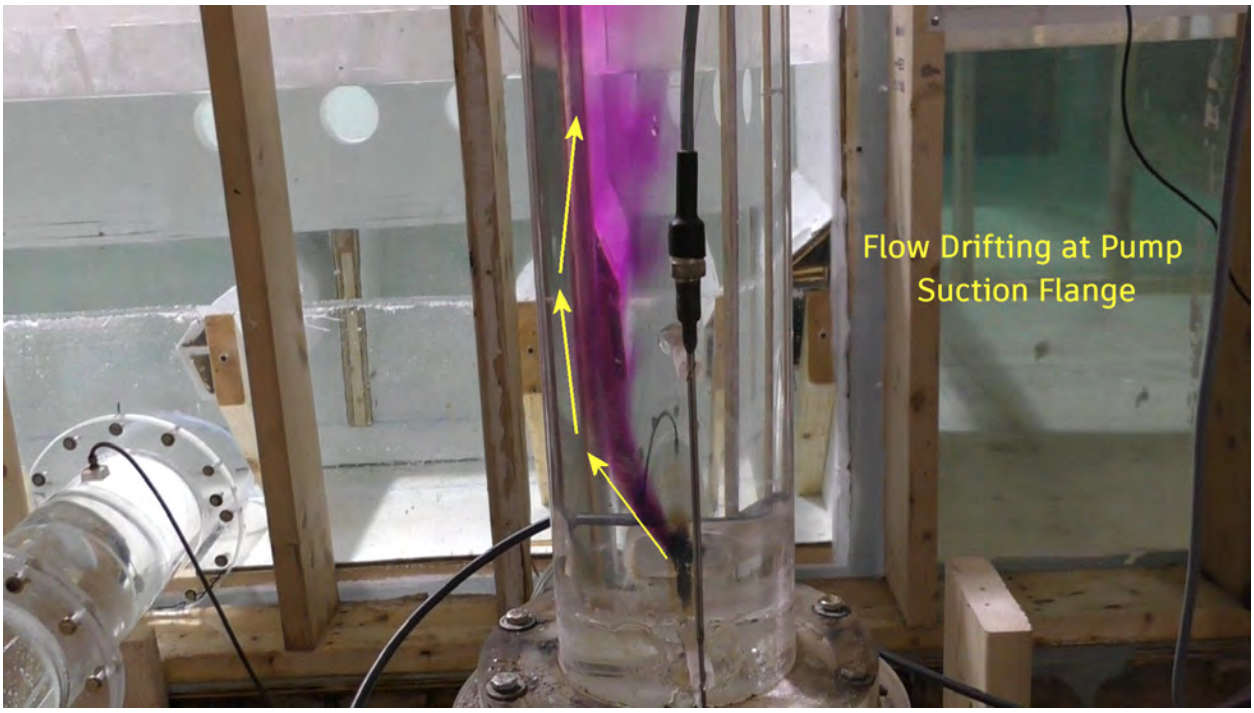

Photo 5-5 Flow Drift at Pump Suction Flange

5.2 Modification Testing

Modification tests were conducted to improve the approach flow conditions within the wet well and to bring velocity and turbulence levels within criteria. Complete data sets and the range of anticipated operating conditions will be investigated during documentation testing. In general:

1. A series of six (6) flow straightening vanes were installed in the suction piping supplying each pump and were effective at stabilizing flow at the pump suction flange. With vanes installed, strong surface vortex activity was still observed.
2. A series of four (4) horizontal beams were installed in the wet well and were effective at eliminating all surface vortex activity and stabilized overall conditions within the wet well.
3. With modifications installed, pre-swirl was low and stable. Velocity and turbulence variations were within criteria across the full range of expected operating conditions.
4. Additional testing was conducted with the plant drain extended to El. (-) 21.30 ft in the wet well and was in operation at 14.16 MGD. Flow entered the wet well under the water surface, which prevented air entrainment and surface oscillations from occurring. Additionally, there was no change to approach conditions with the plant drain in operation, and stable conditions were observed at the pump suction flange.
5. Given the orientation of the horizontal beam installed above Pump 3, extending the plant drain down resulted in interference between the beam and the piping. Removing this beam allowed for surface vortices to organize while operating Pump 3 at a runout flow. The horizontal beam was re-installed in a revised location which eliminated the surface vortex. The revised beam locations remained effective at eliminating surface vortex formation for all remaining conditions.
6. Additional testing was conducted with a 48-in x 36-in reducing elbow and a 36-in x 30-in reducer positioned after the elbow for Pump 1. The additional testing showed similar results to previous testing, with pre-swirl low and stable and velocity and turbulence variations within HI criteria.

Table 5-2 summarizes the modification testing.

Table 5-2 Summary of Modification Tests

Note: All additional testing was conducted during documentation. The following pictures and figures show the recommended modifications installed.

Photo 5-6 Horizontal Beams Installed

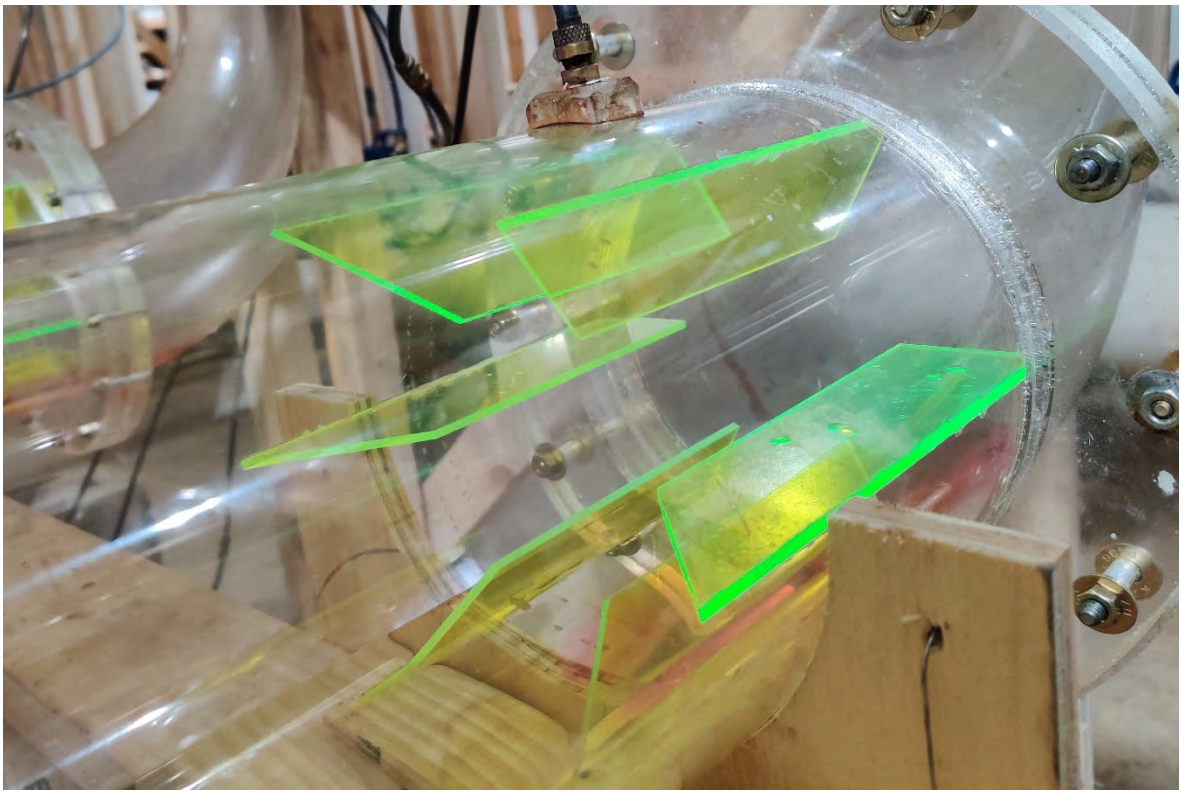

Photo 5-7 Flow Straightening Vanes Installed

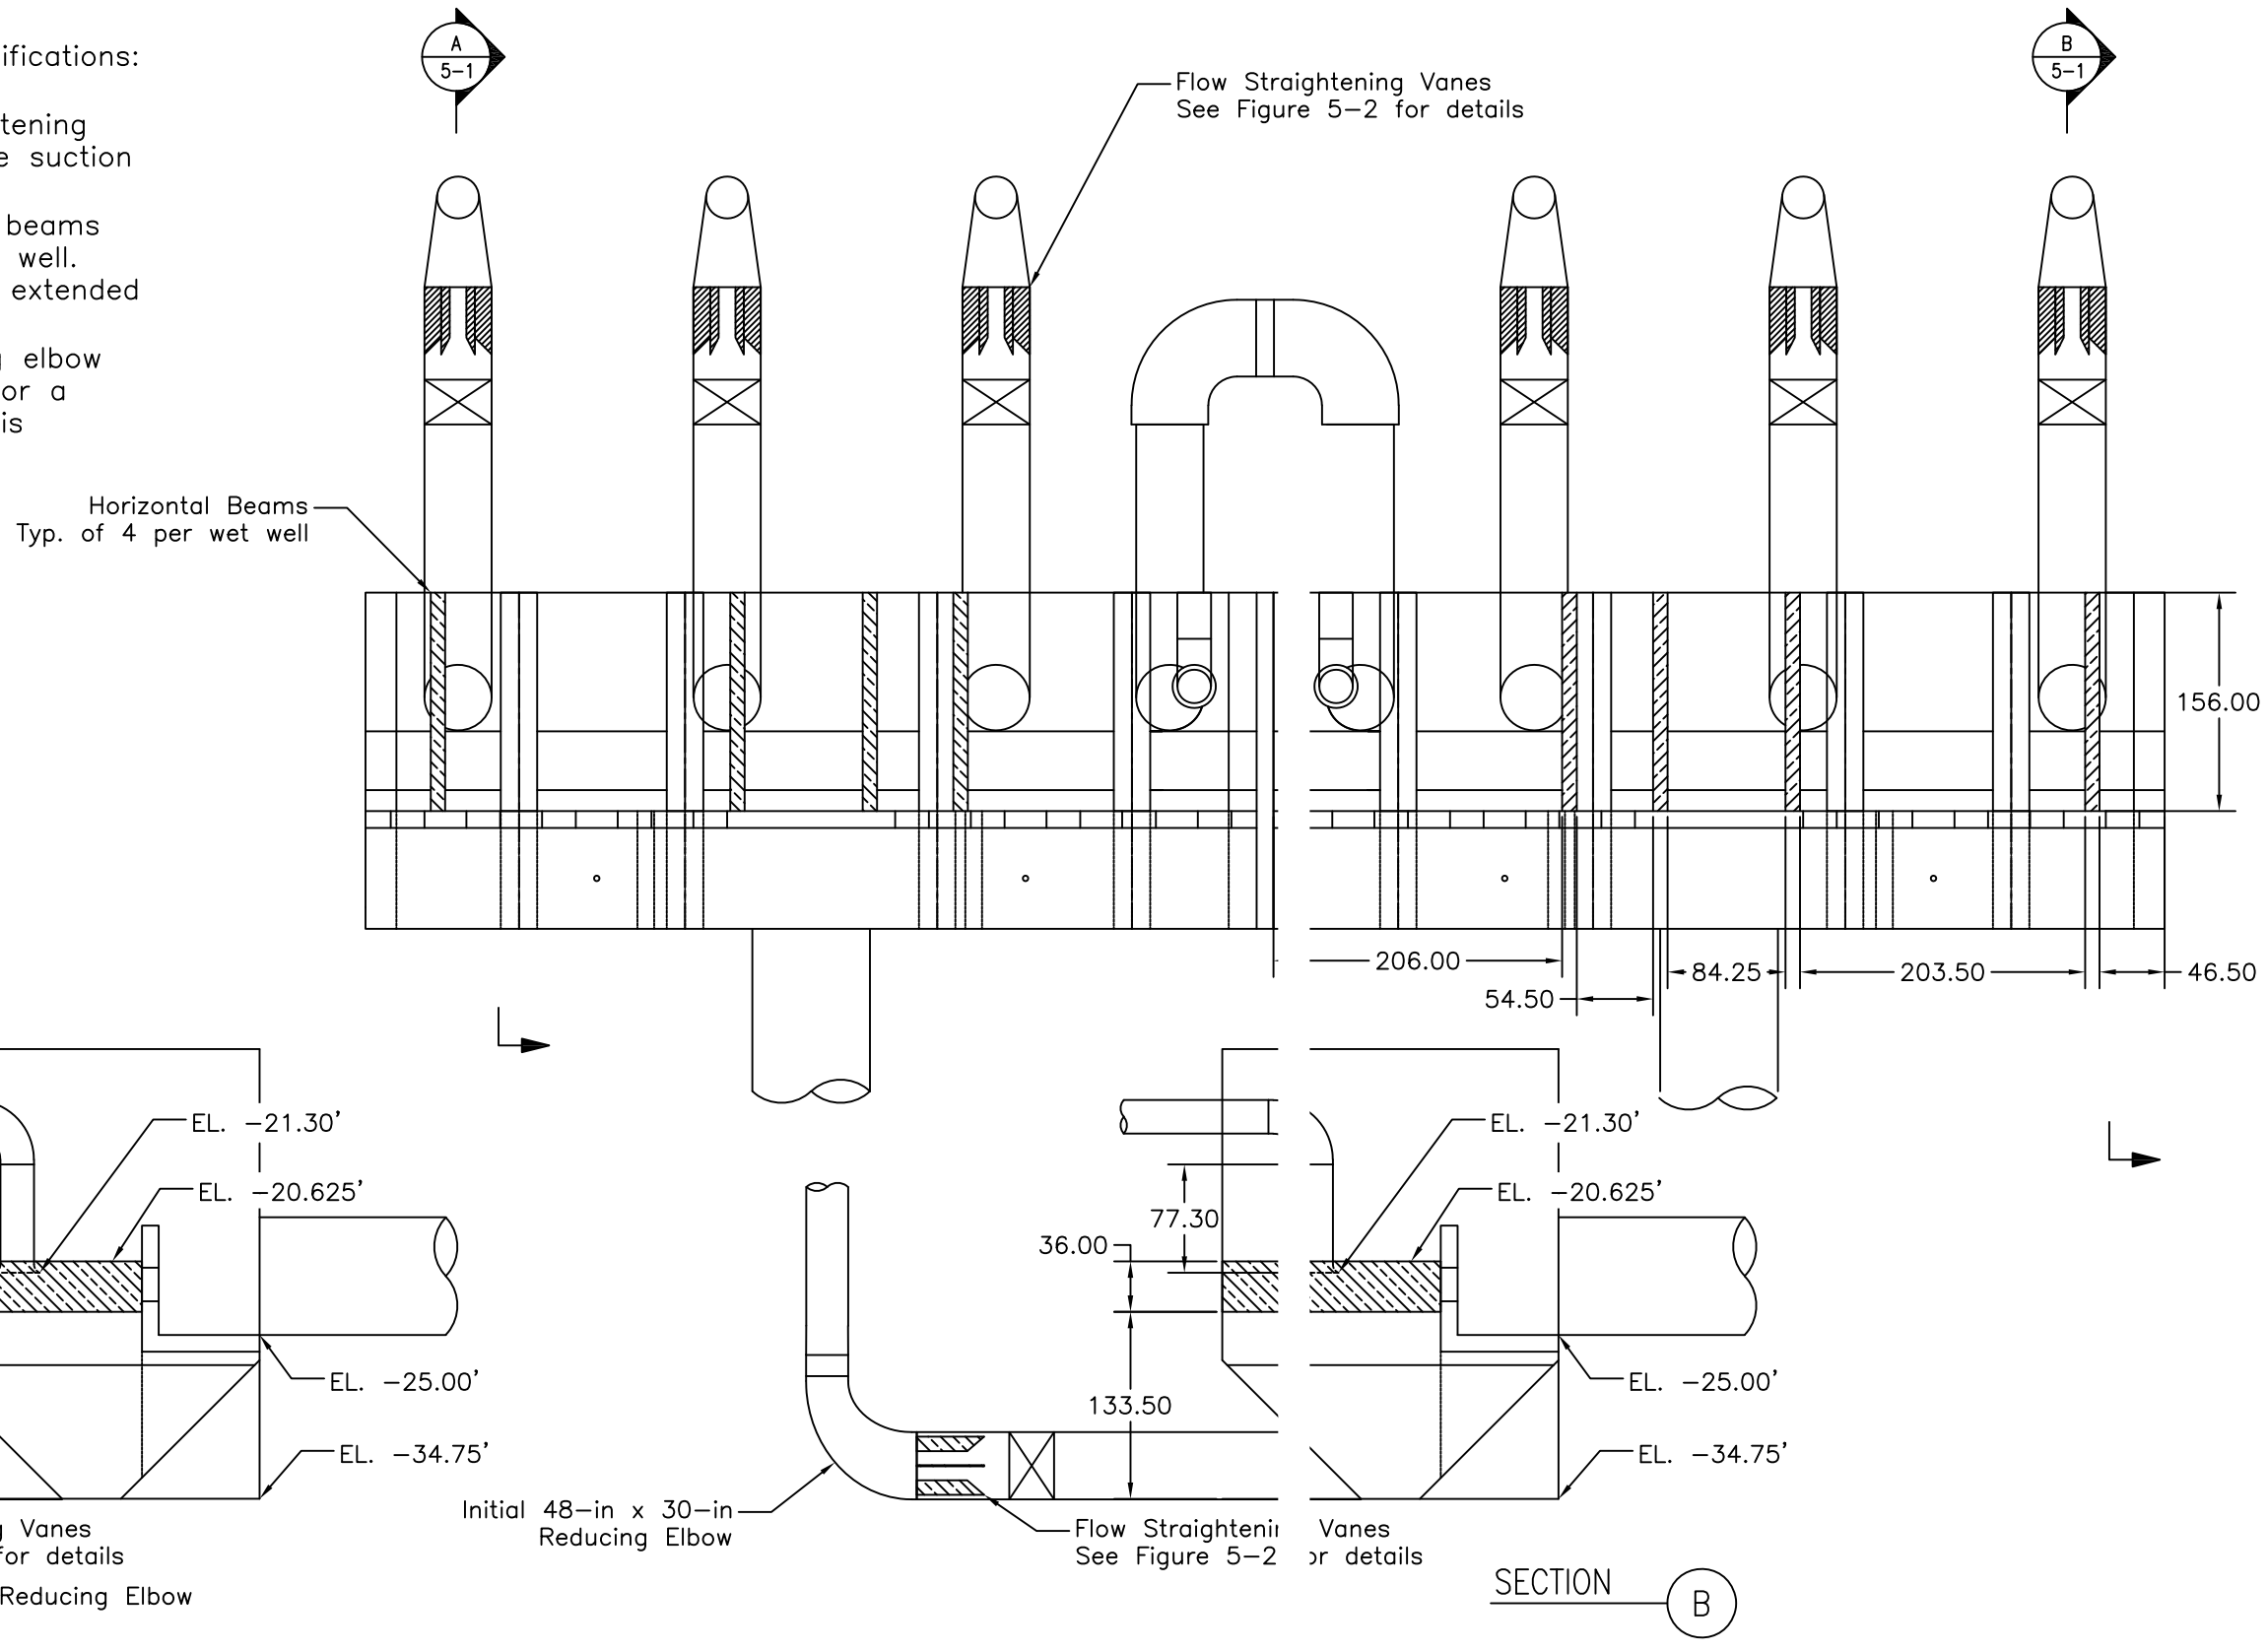

Photo 5-8 Plant Drain Extension

Photo 5-9 Revised Beam Locations

The following are recommended modifications:

1. A series of six (6) flow straightening vanes should be installed in the suction piping supplying every pump.
2. A series of four (4) horizontal beams should be installed in each wet well.
3. The plant drain pipe should be extended to El. (–) 21.30 ft.
4. Both a 48–in x 36–in reducing elbow with a 36–in x 30–in reducer or a 48–in x 30–in reducing elbow is acceptable for operation.

5.3 Witness Testing

A formal witness was held on Tuesday, Mar. 3rd. During the witness test, the model was demonstrated with and without the recommended modifications in place. Video of both baseline testing and final documentation testing will be submitted with the final report.

5.4 Final Documentation Testing

Final documentation testing was conducted to verify the effectiveness of the recommended modifications. The following modifications are recommended and were installed during documentation testing.

- Flow straightening vanes installed
- A series of four (4) horizontal beams installed in the wet well
- The plant drain was extended to El. (-) 21.30 ft
- A 48-in x 36-in reducing elbow and a 36-in x 30-in reducer positioned after the elbow for Pump 1

Table 5-3 shows the final documentation test data.

6.0 INITIAL CONCLUSIONS & RECOMMENDATIONS

6.1 Conclusions

Baseline testing indicated that the trough baffles installed in each wet well were effective at eliminating air entrainment into the pumps across all operating conditions. Given the orientation of the trough baffle openings, however, concentrated influent flow did not re-distribute vertically downwards. This resulted in overall vertical circulation within the wet well and unstable conditions entering the pumps. This instability was more pronounced with more pumps in operation but as pumps were taken offline conditions improved. The more stable conditions within the wet well allowed for organized surface vortices to form. These vortices were infrequent but intermittently organized into a well-organized, air entraining vortex that entered into each pump. Conditions entering the suction piping remained unstable. Frequent flow oscillations and wrapping were observed in the horizontal suction piping approaching the reducing elbows. Once through the elbows, conditions remained unstable passed the pump suction flange. Overall, pre-swirl was elevated and unstable with frequent stalling and burst swirl observed in each operating conditions.

A series of six (6) flow straightening vanes were installed in the suction piping supplying each pump and were effective at stabilizing flow at the pump suction flange. With vanes installed, strong surface vortex activity was still observed. A series of four (4) horizontal beams were installed in the wet well and were effective at eliminating all surface vortex activity and stabilized overall conditions within the wet well. With modifications installed, pre-swirl was low and stable. Velocity and turbulence variations were within criteria across the full range of expected operating conditions. Additional testing was conducted with the plant drain extended to El. (-) 21.30 ft in the wet well and was in operation at 14.16 MGD. Flow entered the wet well under the water surface, which prevented air entrainment and surface oscillations from occurring. Additionally, there was no change to approach conditions with the plant drain in operation, and stable conditions were observed at the pump suction flange. Given the orientation of the horizontal beam installed above Pump 3, extending the plant drain down resulted in interference between the beam and the piping. Removing this beam allowed for surface vortices to organize while operating Pump 3 at a runout flow. The horizontal beam was re-installed in a revised location which eliminated the surface vortex. The revised beam locations remained effective at eliminating surface vortex formation for all remaining conditions. Additional testing was conducted with a 48-in x 36-in reducing elbow and a 36-in x 30-in reducer positioned after the elbow for Pump 1. The additional testing showed similar results to previous testing, with pre-swirl low and stable and velocity and turbulence variations within HI criteria.

6.2 Recommendations

It is recommended that flow straightening vanes be installed in the suction piping supplying the pumps. A series of four (4) horizontal beams should be installed in each wet well. The plant drain

should be extended to El. (-) 21.30 ft. The recommended modifications can be seen in Figures 5-1 through 5-2.

1. Introduction

Corrosion Probe, Inc. (CPI) is pleased to provide this report on the Ultrasonic Testing of Ductile Iron Piping within the Influent Pump Station at the Cedar Creek WWTP in Wantagh, NY.

This report documents the inspection findings, data, analysis, and recommendations, and is respectfully submitted for your review, use, and consideration by,

The Staff of Corrosion Probe, Inc.

Mark Gartside

2. Background

As part of a facility upgrades project, CDM Smith requested that CPI perform an assessment of various sections of the suction and discharge piping between the wet wells and grit tanks. This included potential line stop locations on the discharge piping before the utility tunnels. The inspected piping is presumed to be original to the facility and installed circa 1970. A number of fittings near the grit tanks were replaced in 1988 in addition to a number of pipe sections near the pumps were replaced with ductile iron. All piping inspected is presumed to be 48-inch diameter cast iron piping. It is unknown if the piping was internally lined, but it would be common practice around the time of installation for a coal tar epoxy or cement mortar lining to have been installed. Specifications provided by the client indicate that "Pump discharge piping shall be class 100 cast iron pipe with class 125 flanged fittings...". In addition, the specifications indicate the piping within the utility tunnel to be insulated with "...2" block foamglas insulation".

3. Methodology

On March 4th, 2026, CPI performed an inspection of the ductile iron piping in the influent pump station and utility tunnels. Pipes and locations to be inspected were coordinated with CDM Smith and Cedar Creek WWTP staff prior to mobilizing as well as with those present on site during the inspection. The following inspection techniques were utilized while performing the assessment of the Cedar Creek WWTP facility:

i. Careful visual examination of the pump room piping, line stop locations and lengths of the force mains within the gallery, flanges, and hardware to identify and document the presence of corrosion. Pertinent observations and measurements were recorded during the inspection.

ii. Pipe wall thickness measurements were collected via ultrasonic testing (UT). CPI used the A-scan method (i.e., discrete point-measurement) for this inspection.

    a. Prior to use, the UT gauges were calibrated to generic coupons of the material being tested. The acoustic velocity of gray cast iron will change between pipe sections, even across a single pipe section, but wall thickness measurements appear to be generally reliable based on repeatability and as compared to applicable standards.

    b. Removal of the external coating/surface grinding was not required for CPI to perform UT as CPI utilizes an echo-to-echo function. This allows the gauge to ignore thin, well adhered coatings while measuring the thickness of the denser metal substrate.

iii. In some locations UT could not be performed due to significant surface corrosion, scale, insulation, or where the piping bears on the support or out of reach. Those locations are empty and gray in the related results tables below. CPI removed surface corrosion and loose scale with brass wire brush and scraper where able.

While on site CPI conducted inspections via UT and careful visual inspection. The UT gauge utilized for measurements was a Danatronics ECHO 9DLW. UT uses sound waves to evaluate different properties of materials, including thickness.

A location and a position were documented for each UT data point collected. The location corresponds to a specific ring around the pipe, and the position represents the circumferential position around the pipe at that location. The convention used for the position is shown below in **Figure 1.** Collected measurements are presented in the **Tables** below. Locations of UT measurements can be found in **Appendix A** attached.

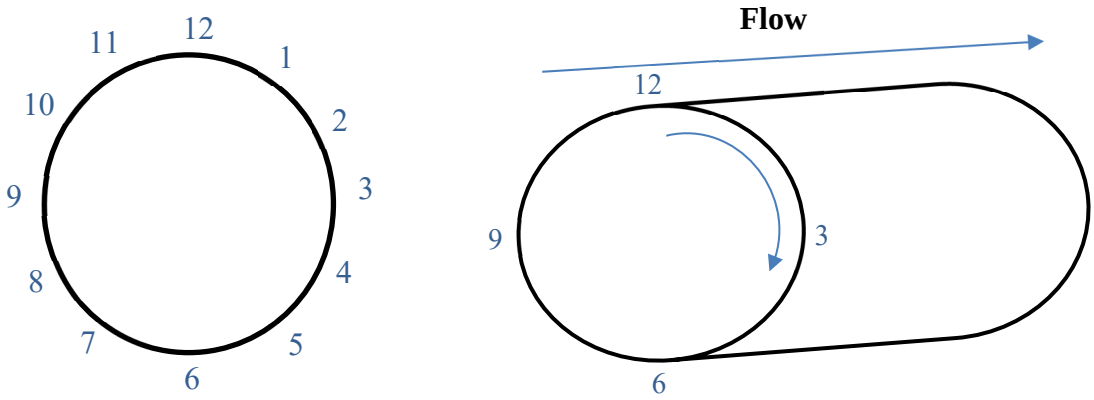

Figure 1 - UT measurement circumferential Positions (i.e., clock positions)

4. Inspection Findings

The coatings throughout the dry well appear to be in poor condition. Top layers of coating have generally failed on the original components with minor surface corrosion observed throughout. Pale red primer was observed at a number of these coating failure locations and tested on site for the presence of lead. In situ lead checks indicated that the pale red primer likely contains some amount of lead. This pale red coating was also observed on the tee fittings within the utility tunnel at testing locations.

The pipe wall thickness at proposed line stop locations was measured within the dry well. The UT measurements can be found in **Table 1** below with **Table 2** providing an estimate of the internal diameter at each location. The coating on the pipe was in overall poor condition. The coating appeared to have three separate layers and was noted to be flaking along a majority of the pipe at the line stop locations. Surface corrosion can be seen where the coating has peeled off or was flaking. The pipe diameter was measured in a number of locations with a consistent external diameter measured to be approximately 50.89”. This is consistent with AWWA C108-53/A21.8-1953 for 48” diameter cast iron, centrifugally cast in sand-lined molds (50.80”). Note that the values referenced in this report did not change between the 1953 edition and the 1975 edition of this standard for 48” diameter piping.

CPI briefly inspected the suction pipe below Line stop 1. It was found to be in poor external condition, so much so that CPI was unable to obtain any measurements due to the irregular, corroded surface. Any existing coating had failed (Photo 4). Manufacturer's markings on the pipe segment appear to indicate Class B pipe manufactured in 1969. This is presumably a reference to AWWA C100 with Class B indicating a 200-feet head pressure rating with a nominal wall thickness of 1.42". The hardware is significantly corroded as well. (Photo 5).

Line stops 2 and 3 were in generally better external condition than Line stop 1. The coating on the piping in both cases was observed to be poorly bonded, if at all, revealing the second coat and primer underneath (Photos 6 & 7). Manufacturer's markings on the adjacent base bends appear to indicate Class B 48" pipe manufactured in 1970 (Photo 8). The exterior coating of both line stops exhibits severe and widespread failure, including extensive peeling and flaking, delamination and cracking, and areas of complete coating loss exposing bare metal. Coating deterioration is most pronounced around flanged joints and bolt heads, along the pipe barrel and at transitions and areas where moisture may accumulate. The remaining coating appears brittle and poorly adhered, providing little to no effective corrosion protection (Photos 9-13).

The pipes are supported by concrete pedestals, which appear intact and properly aligned. The concrete surfaces appear structurally sound but show staining, discoloration, and localized surface wear consistent with moisture exposure. There is no visible cracking or displacement of structural support noted at this time.

The two force mains in the utility tunnels run downstream from Line stops 2 and 3. Facility employees had removed portions of insulation to allow for CPI to inspect the pipes and measure pipe wall thickness. Sections of approximately 6"-12" strips were removed where physically possible. All UT measurements can be found in **Table 3** below. Areas unavailable for UT are noted in Table 2 via blank grey sections. Overall the condition of the pipe from the surface is good. The coating was noted to be intact at all locations where insulation was removed (Photos 14-18). The insulation was different on the elbows and tees compared to the straights. The insulation on the straights was a block foamglas insulation, whereas the elbows and tees were a more fibrous type. A few areas with minor rust staining were found amongst the segments inspected (Photos 19-22).

Table 1: UT Measurements at Line Stop Locations

Line Stop UT Measurements (inches)													
Location	Type	Class	Clock Position								MAX.	MIN.	NOM.	MIN/ NOM
			12:00	1:30	3:00	4:30	6:00	7:30	9:00	10:30				
LS1A	Straight	AWWA C108-53 - A/100	0.765	0.780	0.788	0.760	0.785				0.788	0.760	1.060	72%
LS1B	Straight	AWWA C108-53 - A/100	0.783	0.791	0.693	0.784	0.772	0.780	0.763	0.775	0.791	0.693	1.060	65%
LS2	Straight	AWWA C108-53 - A/100		0.790	0.779	0.788	0.773	0.778	0.781	0.768	0.790	0.768	1.060	72%
LS3	Straight	AWWA C108-53 - A/100		0.781	0.769	0.780	0.786	0.792	0.786		0.792	0.769	1.060	73%

Analysis of the line stop locations is based on the presumption of 48” diameter, Class 100, cast iron pipe centrifugally cast in sand lined molds, per AWWA C108-53/A21.8-1953. Note that the standard values for this specific piping did not change between the 1953 edition and the 1975 edition. Both editions were reviewed for this assessment. Allowable minus tolerance for this diameter of piping would have been 0.10” with an additional minus tolerance of 0.02” allowable over an area not exceeding 8” in any direction. This tolerance would allow for a minimum permitted wall thickness, upon delivery, of 0.94”-0.96” or approximately 89% less than the standard nominal wall thickness.

Table 2: UT Measurements on Utility Tunnel Force Mains

Line Stop Internal Diameter Estimate (inches)					
Location	Type	Class	AVG Wall Thickness	OD	ID
LS1A	Straight	AWWA C108-53 - A/100	0.78	50.89	50.11
LS1B	Straight	AWWA C108-53 - A/100	0.77	50.89	50.12
LS2	Straight	AWWA C108-53 - A/100	0.78	50.89	50.11
LS3	Straight	AWWA C108-53 - A/100	0.78	50.89	50.11

13	Straight	AWWA C108-53 - A/100				0.781	0.768	0.778	0.774		0.781	0.768	1.060	72%
14	Straight	AWWA C108-53 - A/100			0.781	0.763	0.780				0.781	0.763	1.060	72%
15	Straight	AWWA C108-53 - A/100			0.812	0.802	0.798	0.804	0.808		0.812	0.798	1.060	75%
16	Straight	AWWA C108-53 - A/100			0.790	0.768	0.783	0.782	0.787		0.790	0.768	1.060	72%

Analysis of the utility tunnel force mains is based on the presumption of 48” diameter, Class 100, cast iron pipe centrifugally cast in sand lined molds, per AWWA C108-75/A21.8-1975, for the straight sticks of piping and 48” diameter, Class 125, cast iron fittings. ASME B16.1 was referenced for the analysis of the fittings. Standards minus tolerances for ASME B16.1 allow for permitted wall thickness upon delivery to be no less than 87.5% of the nominal wall thickness, or 1.75”. Due to insulation and, primarily, access constraints, a limited number of UT positions were able to be measured on the utility tunnel piping.

5. Conclusions & Recommendations

The coatings on the piping within the dry well are considered to be generally failed. CPI would recommend recoating be considered to prevent future, and ongoing, external corrosion of these components. The suction piping and piping at the lower level below the operating floor most prominently exhibit external corrosion. Testing for hazardous materials within the existing coatings and appropriate measures should be taken during removal and surface preparation activities. A polyamidoamine epoxy (such as Tnemec 69 series) should be considered for external recoating of exposed piping, or insulated piping exposed to overhead dripping or leaks. If existing coatings are well bonded to the piping, a sweep blast surface preparation followed by the appropriate primer and polyamidoamine epoxy coating can be applied.

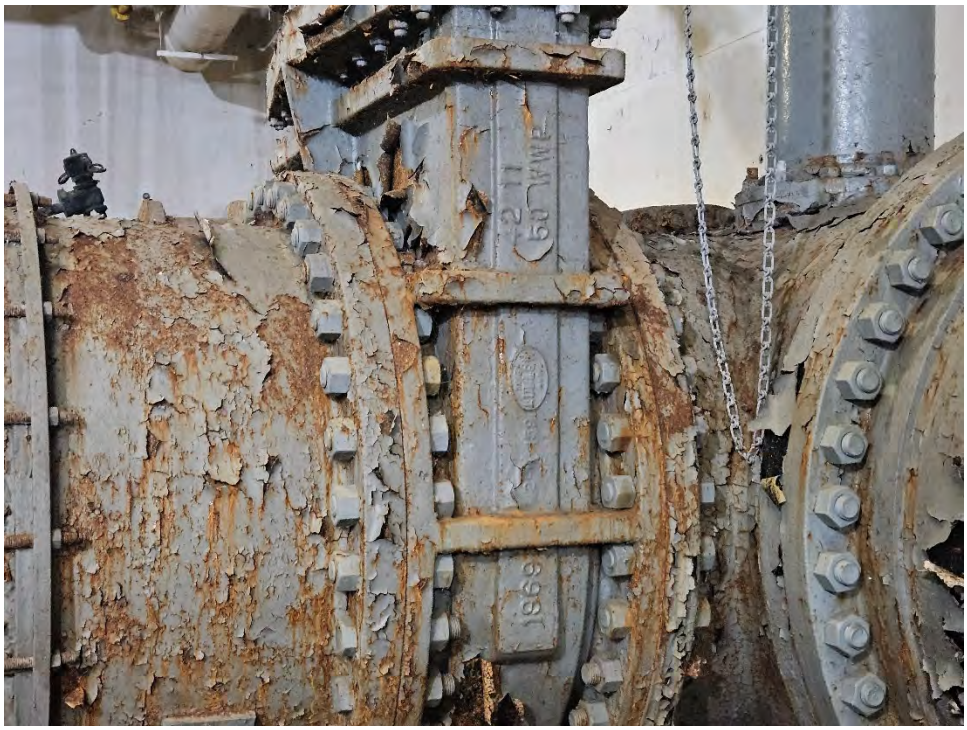
It is common in force mains, particularly at the headworks or front end of a wastewater treatment plant, for erosion to occur, particularly at changes of direction of process flow. Erosion is the mechanical removal of material by loose particles flowing over the material surface. It commonly occurs when grit is entrained or turbulence exacerbates material removal, such as at or near pumps. Erosion is different than corrosion, which degrades material through chemical or electrochemical interactions. Corroded or degraded materials are typically softer than the original materials, making them even more susceptible to erosion. The mode of erosion exacerbating losses where corrosion degradation already exists is commonly termed erosion-corrosion. The extent of erosion-corrosion is based on a number of factors including the rate of flow, process fluid pH, temperature, presence of aggressive ions such as chlorides, viscosity and amount of suspended solids.

Cement mortar lining and epoxy coating systems (more currently) are commonly specified for internal protection of ferrous metal force mains and piping. At the time of installation, coal tar coatings or cement mortar linings would have likely been installed in these pipes. CPI would recommend reviewing any historic documents which may indicate what type of lining system was originally installed. These systems, epoxy and cement mortar, work well to prevent chemical attack of the metal substrates, but will typically break down over time due to physical mechanisms of deterioration, such as erosion. Notably, cement mortar linings will deteriorate faster than epoxy linings due to erosion as well as through acid attack from underdeposit corrosion and in the presence of headspace formation. Installation factors will also affect the service life of these protective linings. Breaches in the lining, poor film quality and dry film thickness, poor surface preparation, or damage from installation will contribute to early failures. Cement mortar linings are more susceptible to biogenic sulfide corrosion, particularly in headspaces, if a sufficient slime layer is allowed to build up on surfaces allowing the propagation of bacteria, most commonly a thiobacillus species, due to insufficient scouring velocity of the process flow or heavy solids accumulation at the invert. Changes in direction of process flow, most common at elbows, crosses, reducers, wyes and tees, create concentration points for more aggressive erosion. In addition to these fittings, valves and segments of piping adjacent to pumps will also experience increased turbulence.

Once any protective lining is deteriorated and the substrate metal is exposed to the process wastewater, electrolytic or oxygen-driven corrosion will deteriorate the ferrous metal pipe wall.

As the corrosion product forms on the internal surface of the pipe wall, the erosive properties of the process flow will strip the corrosion product from the surface, exposing “fresh” metal which will readily corrode.

The wall thickness measurements obtained through UT do not include the thickness of any exterior coatings or interior linings, including cement mortar. The sound waves emitted and received by the UT gauge will travel through the pipe wall and reflect off the back surface, inner face, of the pipe wall instead of carrying through any internal lining, i.e. cement mortar, due to the difference in densities and material properties. An echo-to-echo function is utilized when an external coating is present to negate the thickness of the coating as well.



The discharge piping at proposed line stop locations and the straight sections of piping in the utility tunnels appear to be in generally good condition. Wall thickness measurements indicate some amount of loss throughout the tested locations. An engineer should review remaining wall thicknesses with operational pressures and spans between supports to determine any concerns for continued service. Should the piping still be suitable for service, CPI recommends a robust lining system be installed, such as a 100% solids epoxy coating system. These types of linings are more durable than a cement mortar lining and will perform for an extended period of time. Quality assurance should be performed to confirm film quality and installed thicknesses are established per specifications.

The fittings in the utility tunnels appear to have been subjected to significant thinning of the pipe walls. As compared to the presumed pipe class per the provided specification, the losses are significant. It is possible that these fittings are not original or are otherwise a different class than what is dictated in the provided specification. CPI recommends fully removing the insulation from these fittings to observe the manufacturer’s marking on the fitting which would indicate the class and year of installation. The elbows, Locations 10 and 11, appear to indicate preferential thinning towards the spring line at the outside of the elbow. This would be expected in this type of system due to erosion-corrosion. Only a limited number of positions were able to be tested on these fittings during this inspection. CPI recommends subsequent testing to verify the amount of thinning on these fittings by removing all insulation on the component. The Location 3 elbow also exhibits irregular or preferential thinning and should be further inspected as well to verify wall thickness losses throughout the fitting. Losses appear more significant than would be anticipated as compared to the straight sections of piping. It is likely that these fittings are not as dictated in the specification and further review and analysis should be performed.

EXECUTIVE SUMMARY

LiRo Engineers, Inc. (LiRo) was contracted by CDM Smith to perform an environmental survey of suspect building materials. The purpose of this survey was to develop an inventory of asbestos-containing materials (ACM), PCB and lead based paint that may be impacted by the proposed renovation project at the Cedar Creek Water Pollution Control Plant located at 3340 Merrick Road, Wantagh, NY 11783.

The extent of the project was determined via the 75% Submittal Drawings by CDM Smith, dated January 2026.

LiRo performed this limited environmental survey based to identify, quantify and gather bulk samples of any suspect materials that may be impacted by the work. The laboratory analysis of each sampled material has been included in this report; a summary of the laboratory analysis results is as follows:

- **Materials are assumed to be ACM, as indicated in the initial asbestos survey performed by D&B and reported 03/2017:**
  - **Elevation -28.00 and -35.75 - Gasket Material**
  - **Elevation -28.00 - Vibration Dampening Cloth on Exhaust Units**
  - **Elevation 15.50 – Electrical Cabinets - Backer Board/Transite Panel**
- **Results from the D&B survey report dated March 2017 have been reviewed and the following materials tested positive asbestos containing:**
  - **Cementitious Pipe Insulation Fitting/Elbow (Green Pipe) - Basement**
- **Surface wipes did not detect any evidence of fluid PCB leaks or contamination.**
- **Surface coatings were determined to be lead-based paint (>1.0 mg/cm2).**
- **Fluorescent bulbs were discovered within the survey area that will be impacted by the work of this project. These materials must be disposed of as Universal Waste items. These bulbs are assumed to have PCB containing ballasts that must be disposed of as Hazardous Waste items.**

Section 4.0 of this report includes the details of the inspection for each suspect material within the designated survey area. Details therein include material descriptions and their respective locations, as well as their analytical results

LiRo Engineers, Inc.

235 East Jericho Tpke, Mineola, NY 11501 Telephone 516.746.2350 www.liro-hill.com

1.0 BACKGROUND

LiRo Engineers, Inc. (LiRo) has completed a limited environmental survey for the presence of asbestos-containing materials (ACM), polychlorinated biphenyls (PCBs), lead-based paint (LBP) at the following buildings:

Site: Cedar Creek WPCP
Address: 3340 Merrick Road, Wantagh, NY 11783

The inspectors responsible for this project are:

Rosemarie Salerno	EPA Lead Inspector	Cert. No.: LBP-R-111498-3	Exp.: 04/11/2027
	NYS DOL Asbestos Inspector	Cert. No.: 25-61V89-SHAB	Exp.: 10/2026
Chuks Okoh	EPA Lead Inspector	Cert. No.: LBP-R-18740-4	Exp.: 01/27/2029
	NYS DOL Asbestos Inspector	Cert. No.: 25-6LTSG-SHAB	Exp.: 12/2026

Site Visit(s): May 7, 2026 and May 8, 2026

The laboratories used in the analysis of the samples were:

EMSL Analytical: 117 East 30th Street New York, New York, 10016
NVLAP No.: 200546-0 NYS DOL ELAP No.: 11480

Long Island Analytical: 110 Colin Drive, Holbrook, New York, 11741
NYS DOL ELAP No.: 11693

2.0 SCOPE OF WORK

Interior and exterior areas were inspected at Cedar Creek WPCP in relation to the proposed renovations as detailed in the 75% Submittal Drawings by CDM Smith, dated January 2026. The inspection was characterized by a close visual inspection of all accessible areas. Suspect materials found were sampled and inventoried for quantity, condition, and friability.

3.0 FILE SEARCH RESULTS

An asbestos inspection report from D & B Engineers and Architects, P.C., dated March 2017 was reviewed. The following materials tested positive for asbestos:

- **Cementitious Pipe Insulation Fitting/Elbow**

4.0 SUMMARY OF INSPECTION RESULTS

4.1 ASBESTOS CONTAINING MATERIALS (ACM)

Asbestos Guidelines

Guidelines used for the Asbestos inspection were established by the Environmental Protection Agency (EPA) in the Guidance for Controlling Asbestos Containing Materials in Buildings, Office of Pesticides and Toxic Substances, DOC #560/5-85-024, and 40 CFR Part 763, Asbestos Hazard Emergency Response Act (AHERA).

Field information was organized as per the AHERA concept of homogenous area (HA). That is, suspect ACM with similar age, appearance, application, and texture was grouped together, sampled, and assessed for condition.

Bulk samples of suspect ACM were analyzed by Polarized Light Microscopy (PLM) with dispersion staining, as described in 40 CFR Part 763 and the National Emissions Standard for Hazardous Air Pollutants (NESHAPS).

All samples were initially analyzed by using Polarized Light Microscopy. Samples which yielded a negative PLM result, and which are classified as a "non-friable" material were then re-analyzed utilizing transmission Electron Microscopy methodology.

Inspection Scope and Material Assessment

The asbestos inspection involved a thorough visual examination of all areas likely to be impacted by the proposed renovation activities. Suspect materials were identified, sampled, and inventoried. Photos of survey areas and materials are presented in Appendix C.

Materials, which are expected to be impacted by the proposed scope of work, have been confirmed to contain asbestos.

A summary of the inspection results in present in Table 4.1.

Table 4.1: Summary of ACM Inspection Results

HA No.	Location	Material	No. of Samples	Results	Quantity	Notes
1	Roof Level 50.50	Top Membrane	2	No Asbestos Detected (NAD)	0.0	PACM roofing in the D&B report has been determined to not contain asbestos
2	Roof Level 50.50	Felt paper on Roof Deck Insulation	2	NAD	0.0	
3	Roof Level 50.50	Roof Deck Insulation	2	NAD	0.0	
4	Roof Level 50.50	Bottom Tar Coating	2	NAD	0.0	
5	Elevation 30.50	Ceramic Tile Grout	2	NAD	0.0	----
6	Elevation 30.50	Ceramic Tile Backing	2	NAD	0.0	----
7	Elevation 4.50 Force Main	Big Pipe - Insulation Wrap (Blue)	3	NAD	0.0	----
8	Elevation 4.50 Force Main	Big Pipe – Insulation Black Cork/Foam Material	3	NAD	0.0	----
9	Elevation -28.00 (Sub-Basement Dry Well)	Centrifugal Pumps Gasket Material	2	NAD	0.0	New
10	Elevation 30.50	Duct/HVAC Insulation (Vertical)	2	NAD	0.0	----
-	**Elevation -28.00 and -35.75**	**Gasket Material**	-	**Assumed ACM**	**200.0 SF**	**Old - Inaccessible**

HA No.	Location	Material	No. of Samples	Results	Quantity	Notes
-	Elevation 15.50	Assumed Underlayment beneath the Terrazzo Flooring	-	Not Observed	0.0	PACM underlayment in the D&B report has been confirmed to not be present (no suspect ACM)
-	**Elevation -28.00**	**Vibration Dampening Cloth on Exhaust Units**	-	**Assumed ACM**	**8.0 SF**	**Inaccessible as the duct was still in use**
-	Throughout	Vinyl Wire Insulation	-	Non-Suspect	0.0	----
-	**Elevation 15.50 – Electrical Cabinets**	**Backer Board/Transite Panel**	-	**Assumed ACM**	**500.0 SF**	**Inaccessible due to Live Electric**
-	Elevation -6.50/4.50	Assumed Backer Board/Transite Panel and Braided Wiring	-	Not Observed	0.0	Confined Space Area
-	Elevation -6.50/4.50	Metal Backer Board and Vinyl Wire Insulation	-	Non-Suspect	0.0	Confined Space Area
File History – D&B Engineers, March 2017						
-	**Elevation -28.00**	**Cementitious Pipe Insulation Fitting/Elbow**	-	**ACM**	**50.0 LF**	----
-	**Elevation -6.50**	**Cementitious Pipe Insulation Fitting/Elbow**	-	**ACM**	**10.0 LF**	----
-	**Elevation 15.50**	**Cementitious Pipe Insulation Fitting/Elbow**	-	**ACM**	**10.0 LF**	----
				Total ACM Quantity	**708.0 SF / 70.0 LF**	

*** Quantities of material to be impacted will be developed as the exact scope of renovations is determined through the design process.**

An asbestos-containing material (ACM) is any material containing more than one percent (1%) asbestos. Any material not listed or addressed must be assumed ACM. If any materials that are not listed are encountered, all work must cease and representatives from CDM Smith must be contacted immediately.

4.2 LEAD-BASED PAINT (LBP)

Field Survey Procedures

The random sampling protocol described in the 40 CFR Part 745, U.S. EPA Lead Renovation, Repair, and Painting Rule was utilized in developing the sampling procedures for this LBP survey. Random sampling of a facility or structure that has similar characteristics such as construction materials, painting histories, and date of construction is considered an appropriate methodology. The survey was conducted in accordance with the U.S EPA Standards.

Inspection Scope and Material Assessment

The random sampling protocol described in the 40 CFR Part 745, U.S. EPA Lead Renovation, Repair, and Painting Rule was utilized in developing the sampling procedures for this LBP survey using a handheld X-Ray Fluorescence (XRF) unit. The XRF unit automatically calibrates each time the device is turned on. The calibration is accomplished

by sampling the tungsten shield and adjusting its sampling results to match the known response of the tungsten. This calibration was conducted at the beginning and end of testing. Paint containing greater than or equal to 1.0 milligram per square centimeter (mg/cm^2) of lead was considered LBP.

Inspection Scope and Material Assessment

The LBP inspection involved the visual inspection of the area to be affected, and the collection of XRF readings from all suspect surfaces. The following table provides a summary of laboratory analyses of the samples:

Table 4.2 – LBP (XRF) SUMMARY OF INSPECTION RESULTS (SIRT)

Surface coatings were determined to be lead-containing paint. Many of these surfaces will be impacted by the proposed work. The removal of coatings, intact or damaged, will need to be performed by an EPA licensed lead paint abatement contractor, and disposed of as hazard waste in accordance with US EPA and NYS DEC regulations.

4.3 POLYCHLORINATED BIPHENYLS (PCB'S)

Definition

Polychlorinated biphenyls (PCBs) are a group of organic compounds used in the manufacture of plastics, as lubricants, and dielectric fluids in transformers, in protective coating for wood, metal, and concrete, and in adhesives, wire

coating, and so forth. They are highly toxic to aquatic life and persist in the environment for long periods of time. They can accumulate in food chains and may produce harmful side effects at high concentrations.

LiRo collected wipe samples from surfaces to identify any evidence of PCB contamination. Only a single sample from Confined Space Area -6.5 was determined by lab testing to have a quantifiable concentration of PCB, which was below the 1.0 mg/kg action level (see Appendix B and Table 4.3 below). No bulk sealants or caulking that may be suspect PCB containing materials were observed.

Inspection Scope and Material Assessment

Table 4.3 – Summary of PCB Inspection Results - Wipes

Homogeneous Area	Location	Description of Material	Results [mg/kg]	PCB Containing	Notes
1	Main Floor (15.50)	Concrete Pad	<50.0	No	-
2	Sub-Basement (-28.00)	Concrete Pad	<50.0	No	-
3	Sub-Basement (-28.00)	Concrete Pad	<50.0	No	-
4	Sub-Basement (-28.00)	Concrete Pad	<50.0	No	-
5	Sub-Basement (-28.00)	Concrete Pad	<50.0	No	-
6	Confined Space Area (-6.50)	Concrete Pad	<50.0	No	-
7	Confined Space Area (-6.50)	Concrete Pad	0.314	No	-
Total Estimated PCB Containing Material Quantity				**0.0 SF**	

Materials sampled tested negative for PCBs (> 1 mg/kg).

Fluorescent light fixtures are presumed to utilize PCB containing ballasts that would impose certain obligations in regards to the hazardous waste nature of the ballasts if these items require replacement/removal as part of the scope of work at each/any location. **Light fixtures/ballasts were observed on site that would be impacted by the work of this project. Any presumed PCB ballasts must be removed as hazardous waste.**

4.4 UNIVERSAL/HAZARDOUS WASTE

Field Survey Procedures

The Contractor is responsible for the removal, characterization, transport and disposal of any universal wastes within the work area. Hazardous wastes of the following types may be managed as universal waste:

- Aerosol cans that contain a product and/or propellant that is hazardous.
- Batteries such as lead/acid, lead, nickel-cadmium, silver, lithium, lithium-ion, or mercury
- Lamps such as fluorescent tubes, compact fluorescent lamps (CFLs), light emitting diodes (LEDs), and mercury vapor lamps.
- Paint that is an architectural or structural coating, such as oil-based paints, stains and varnishes, single part epoxies, or bridge paint.

- Thermostats and other mercury-containing equipment (MCE) such as thermometers, barometers, manometers, temperature and pressure gauges, or mercury switches.

Inspection Scope and Material Assessment

During our survey, LiRo performed "room to room" observations of the building and identified building components, fixtures, and stored items that may be considered a universal waste.

Fluorescent light fixtures contain fluorescent bulbs that would impose certain obligations in regards to the universal a waste nature of the bulbs if these items require replacement/removal as part of the scope of work at each/any location. L**ight bulbs were observed on site that would be impacted by the work of this project.**

Any exit signs/smoke detectors/air condition units must also be removed as universal waste.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Materials, which are expected to be impacted by the proposed scope of work, have been shown by laboratory analysis to contain asbestos. Materials that could not be accessed for bulk sampling have been assumed to be asbestos containing.

In the event that any ACM or Presumed ACM needs to be impacted by the project, a licensed abatement contractor must perform the removal of all friable and non-friable ACM. LiRo Engineers, Inc. believes that the implementation of these recommendations will serve to best protect human health and the environment.

To ensure that the removal of the aforementioned ACM is properly and effectively carried out, the following recommendations are proposed by LiRo Engineers, Inc.

A. Develop and implement a schedule that outlines the time frame for removal of asbestos-containing materials.

B. Develop complete and concise specifications to effectively deal with removal of the asbestos-containing material. These specifications should be developed to comply with all applicable Federal, State, and Local regulations.

C. Retain the service of an independent testing laboratory to monitor the quality of the air before, during, and after the removal work. Retain all documentation and correspondence from the removal contractor, the testing laboratory, and related items in a permanent record.

Surface wipes did not detect any evidence of fluid PCB leaks or contamination.

Fluorescent light fixtures & Presumed PCB-Containing Ballasts are to be removed as part of this project. The fluorescent light bulbs are universal waste items, and the fixtures are presumed to be PCB-containing hazardous waste.

The Contractor is advised that the Work of the Contract may impose certain obligations and requirements mandated by the US Department of Labor Occupational Safety & Health Administration regulations, Title 29 CFR 1926.62 Lead Exposure in Construction, relative to the potential exposure to lead by its employees. The Contractor assumes entire responsibility and liability for complying fully in all respects with these regulations. Additionally, the removal

of coatings, intact or damaged, will need to be performed by an EPA licensed lead paint abatement contractor, and disposed of as hazard waste in accordance with US EPA and NYS DEC regulations.

6.0 AREAS NOT ACCESSIBLE

LiRo Engineers, Inc. inspected and sampled materials, which were observable and accessible to the survey team, at the time of inspection. It is possible however, that additional suspect asbestos-containing material (ACM) may exist inside other concealed spaces, which were not accessible without using destructive means such as concealed insulation/waterproofing tars and/or braided wire insulation. Any materials that have not been tested and/or found asbestos positive must be presumed asbestos-containing material (PACM).

7.0 REPORT CERTIFICATIONS

LiRo Engineers, Inc. certifies that the information contained herein is based on the physical and visual inspections conducted by LiRo Engineers, Inc. and data collected during the inspection survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. Estimation of uncertainty available upon request. This report is a summary of multiple methods of analysis, fully compliant reports are available upon request. All samples examined for the presence of vermiculite when analyzed via NYS 198.1. A combination of PLM and TEM analysis may be necessary to ensure consistently reliable detection of asbestos. Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. This report must not be used to claim product endorsement by NVLAP of any agency or the U.S. Government . Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos containing. NOB= Non friable organically bound; N/A= Not applicable VCM= Vermiculite containing material.

Samples analyzed by EMSL Analytical, Inc. Long Island City, NY NYS ELAP 11506, NVLAP Lab Code 101048-9

Re: Cedar Creek 3340 Merrick Rd

Dear Liro Engineers, Inc.,

Enclosed please find the laboratory Analysis Report(s) for sample(s) received on May 11, 2026. Long Island Analytical laboratories analyzed the samples on May 12, 2026 for the following:

SAMPLE ID	ANALYSIS
Main Fl (15-50) #1	EPA 8082 A
2 Sub Basement (-28)	EPA 8082 A
3 Sub Basement (-28)	EPA 8082 A
4 Sub Basement (-28)	EPA 8082 A

PERSONNEL CERTIFICATION(S)

United States Environmental Protection Agency

This is to certify that

Liro Engineers, Inc.

has fulfilled the requirements of the Toxic Substances Control Act (TSCA) Section 402, and has received certification to conduct lead-based paint activities pursuant to 40 CFR Part 745.226

In the Jurisdiction of:

All EPA Administered Lead-based Paint Activities Program States, Tribes and Territories

This certification is valid from the date of issuance and expires May 18, 2027

LBP-14409-3

Certification #

May 01, 2024

Issued On

Marc Edmonds, Chief

Risk Assessment Management Branch 2.

WE ARE YOUR DOL

NEW YORK STATE | Department of Labor

DIVISION OF SAFETY & HEALTH LICENSE AND CERTIFICATE UNIT, STATE OFFICE CAMPUS, BLDG. 12, ALBANY, NY 12226

ASBESTOS HANDLING LICENSE

LiRo Engineers, Inc.
690 Delaware Avenue, Buffalo, NY, 14209

License Number: 28866
License Class: RESTRICTED
Date of Issue: 11/20/2025
Expiration Date: 12/31/2026
Duly Authorized Representative: Robert Kreuzer

This license has been issued in accordance with applicable provisions of Article 30 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project worksite. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

Amy Phillips, Director
For the Commissioner of Labor

United States Environmental Protection Agency

LABORATORY ACCREDITATION

United States Department of Commerce
National Institute of Standards and Technology

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 101048-9

EMSL Analytical, Inc.

Long Island City, NY

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Asbestos Fiber Analysis

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique on ISO/IEC 17025).

2025-07-01 through 2026-06-30

Effective Dates

For the National Voluntary Laboratory Accreditation Program

SCOPE OF ACCREDITATION TO ISO/IEC 17025:2017

EMSL Analytical, Inc.
10-39 45th Road

1.0 INTRODUCTION

D&B Engineers and Architects, P.C. (D&B) was retained by the Nassau County Department of Public Works (DPW) to perform a limited hazardous materials assessment of the Cedar Creek Water Pollution Control Plant (WPCP) located at 3340 Merrick Road in Wantagh, New York. It is D&B's understanding that Nassau County DPW is planning to remove and replace pumps A-1 through A-7, electrical cabinets on the main floor, associated piping, duct work, wet wells and other associated equipment located within the Main Building at the Cedar Creek WPCP. The proposed plant upgrade will affect portions of the Main Building's main floor, basement, sub-basement and pit level in vicinity of Pumps A-1 through A-7. The objective of this limited hazardous materials assessment is to determine the presence, extent and condition of any hazardous materials that may be present within the area of work within the Main Building, as defined in Section 2.0 of this report, at the time of the field inspection.

The field activities associated with this limited hazardous materials assessment were performed on January 27, 2017.

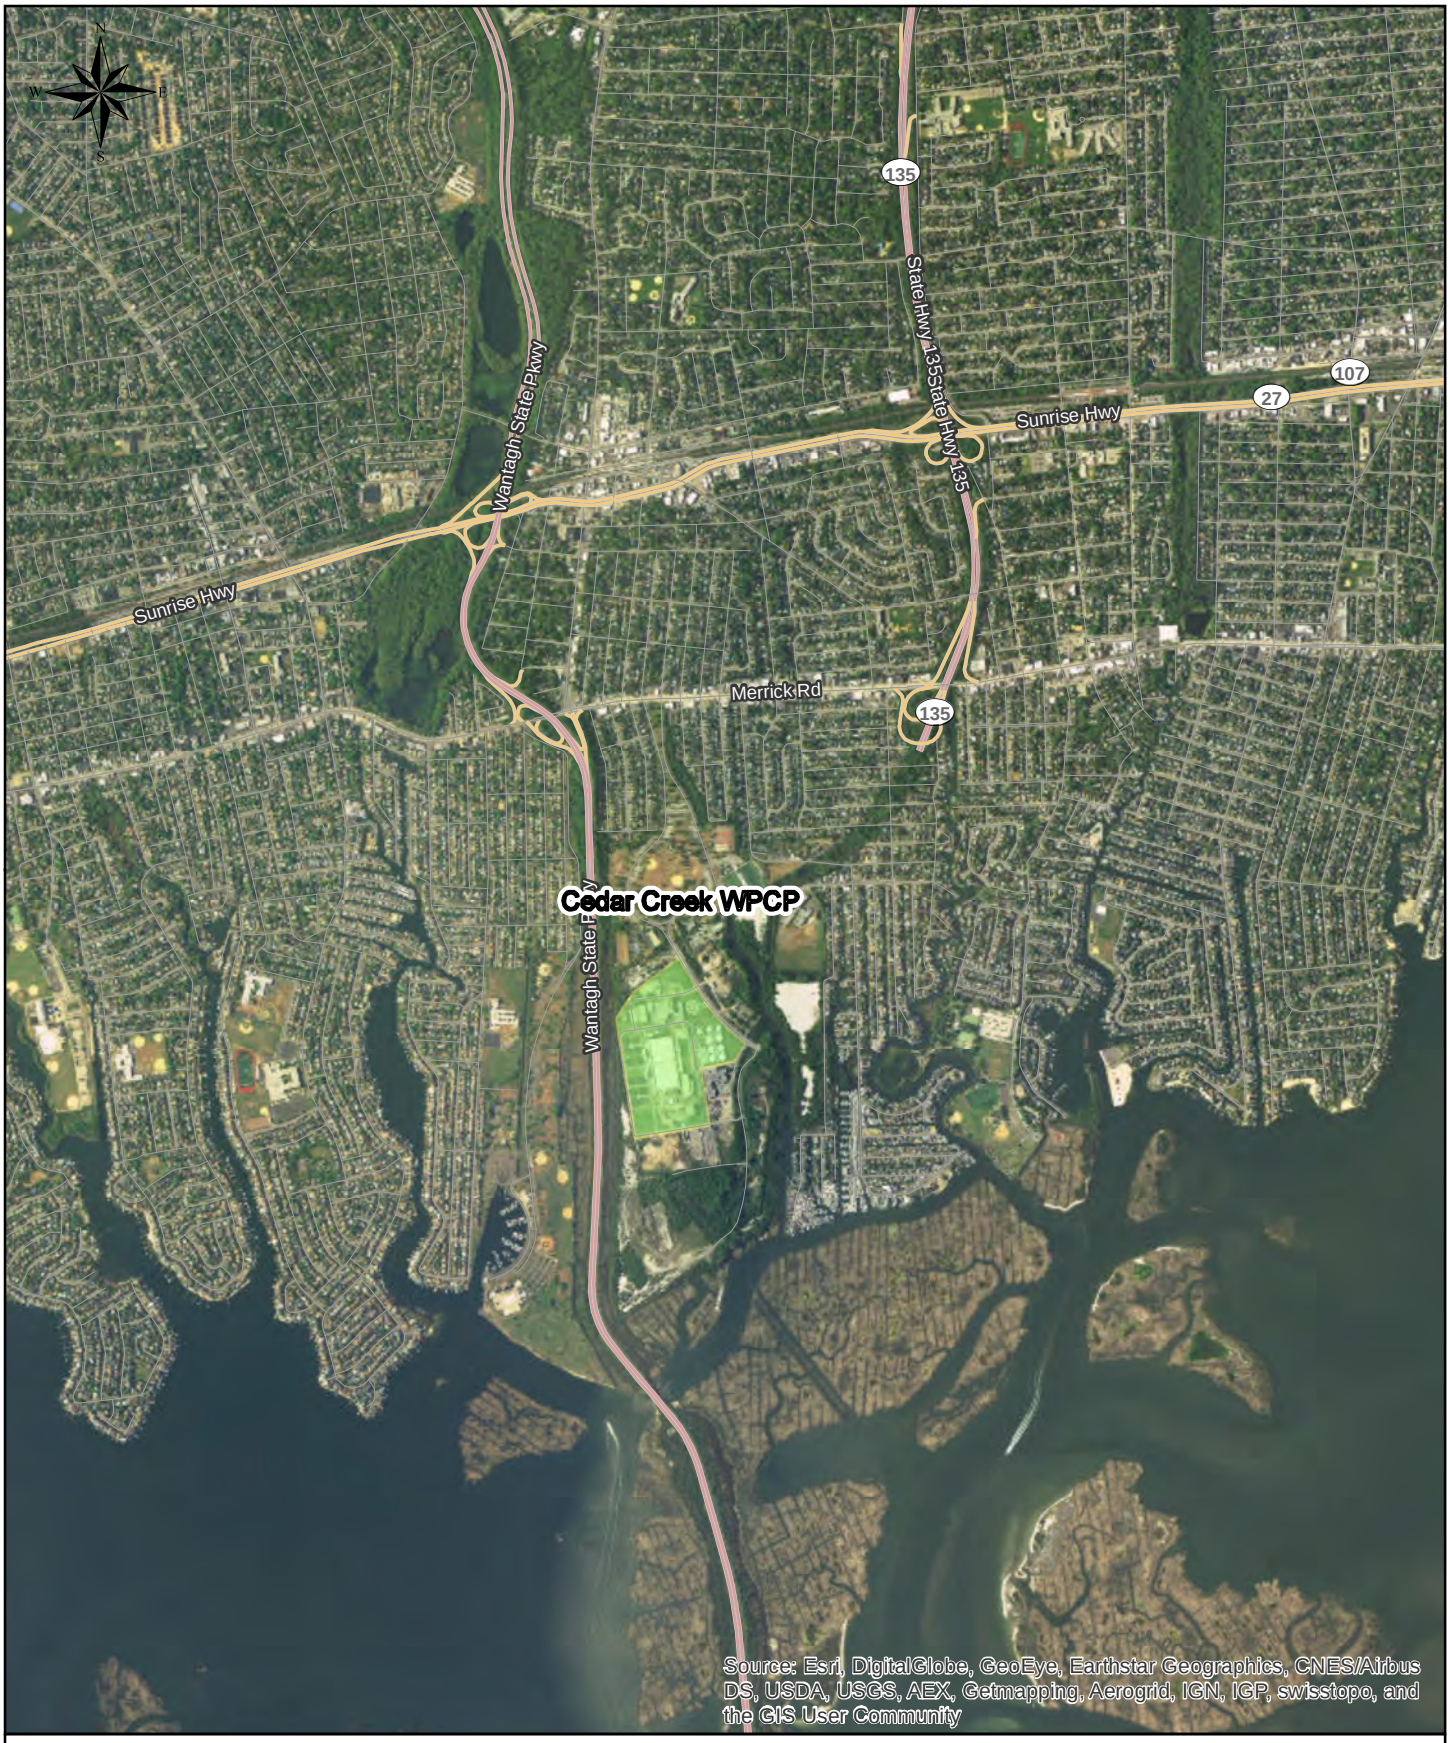
The findings contained within this report are consistent with accepted principles and practices established and prescribed by the United States Environmental Protection Agency (USEPA) and the New York State Department of Labor (NYSDOL) with respect to asbestos and lead-based paint surveys and reporting. In addition, the waste management procedures outlined herein are consistent with the regulations established by the USEPA and the New York State Department of Environmental Conservation (NYSDEC).

Section 2.0 of this report contains a physical description of the property and buildings located on-site. Section 3.0 of this report contains the methodology employed during the performance of this limited hazardous materials assessment. The findings of the assessment are presented in Section 4.0, and the conclusions and recommendations of the assessment are presented in Sections 5.0 and 6.0, respectively.

1.1 Limitations

D&B assumes no responsibility, liability, or risk for the use of this report for any purpose other than as a limited assessment to be used for informational purposes only. The contents of this report, including the findings, results, conclusions and recommendations presented herein, are based on information available at the time of the actual on-site survey. The assessment was limited to the area of work contained within the Main Building on the main floor, basement, sub-basement and pit level present at the time of the inspection. Destructive activities to identify concealed asbestos-containing material (ACM) were not performed in order to avoid compromising the weather-tight condition of the building. In addition, certain materials were not sampled due to safety and operational concerns (see Section 4.0). Furthermore, due to the potential for concealed ACM to be present, this report should not be construed to represent all ACM located at the site; all quantities of ACM identified and all dimensions referenced in this report shall be considered approximate and shall be verified on-site.

1.2 Qualifications



D&B Engineers and Architects, P.C. has the experience and certifications necessary to perform a hazardous materials survey for the area of work located in Main Building on the subject property. Specifically, D&B is in possession of a New York State Department of Labor (NYSDOL) Asbestos Handling License (License No. 28587), as well as a lead-based paint certification issued by the United States Environmental Protection Agency (USEPA) (Certification No. NY-I-17775-2). In addition, the individuals performing the survey are certified inspectors under the NYSDOL asbestos inspection program and the USEPA lead assessment program. Lastly, the inspectors have the training and experience necessary to identify waste materials that require special handling under the USEPA and NYSDEC environmental regulations. Copies of the applicable asbestos licenses are presented in Appendix A of this report.

2.0 FACILITY DESCRIPTION

The Cedar Creek WPCP is located at 3340 Merrick Road in Wantagh, New York (see Figure 2-1). The Cedar Creek WPCP was originally constructed in 1974 and is a secondary activated sludge facility capable of biochemical oxygen demand reduction. The facility is designed for an average daily flow of 72 million gallons per day (MGD) of wastewater, with actual daily average flows of 50 MGD. The plant serves Nassau County's Sewage Disposal District No. 3, which serves a population of approximately 600,000, treating domestic, commercial and industrial wastewater. The Cedar Creek WPCP property is approximately 76 acres and is comprised of 22 buildings.

The limits of work for this assessment included portions of the main floor, basement, sub-basement and pit level in the vicinity of Pumps A-1 through A-7 within the Main Building. The ceilings in the area of work are constructed of concrete (both painted and unpainted). The floors are constructed of concrete (both painted and unpainted) and terrazzo. The walls are constructed of concrete (both painted and unpainted), cinder block, painted plaster and ceramic tiles with mortar. A service elevator and staircase are located along the south side of the area of work. The limits of the area of work are shown on Figures D-1 through D-5 in Appendix D.

The area of work on the main floor includes pump motors A-1 through A-7, associated energized electrical cabinets and a suspect dismantled chemical feeder system located on the main floor north and southwest of Pump A-6 (a label on the unit indicates "T-5 Bldg. H Grade Floor"). The basement level includes the catwalk level, the rotating shafts associated with Pumps A-1 through A-7 (running down to the sub-basement level), fan exhausts, duct work, insulated potable and non-potable water piping, sewer piping, and heating piping. A 500-gallon insulated single-walled steel aboveground storage tank (AST) located on the basement level of the Main Building is used to store hydraulic oil for Pumps A-1 through A-7. The sub-basement level includes Pumps A-1 through A-7, two sump pits and associated piping. The pit level consists of the wet wells, associated piping and suction valves for Pumps A-1 through A-7. The extents of this hazardous materials survey are limited to only those areas where work is proposed under the plant upgrade project.

FIGURE 2-1

3.0 METHODOLOGY

The following provides a brief description of the methodology used in performing the limited hazardous materials survey for the area of work described in Section 2.0 of this report.

3.1 Asbestos-Containing Materials

An asbestos survey was performed for the area of work in order to determine the locations, quantities, friability and condition of any asbestos-containing materials (ACM) present. The survey was performed in accordance with the asbestos bulk sampling protocols for multi-layered building systems and materials as specified in the applicable provisions of the following standards:

- United States Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) (40 CFR Part 763, Subpart E)
- USEPA Asbestos School Hazard Abatement Reauthorization Act (ASHARA) (40 CFR Part 763, Subpart E)
- New York State Department of Labor (NYSDOL) Industrial Code Rule 56 (12 NYCRR Part 56)

The purpose of the assessment was to identify whether any suspect ACM is present within the area of work and to sample and determine whether the material is ACM prior to any demolition or renovation activities. NYSDOL's Industrial Code Rule 56 (ICR 56) defines ACM as any material that contains greater than 1% asbestos by weight and requires all ACM to be removed by a licensed asbestos abatement contractor prior to building renovation or demolition. Those materials containing asbestos at concentrations less than or equal to 1% asbestos by weight are classified as non-regulated ACM.

During the assessment, all accessible portions of the area of work were visually assessed to identify any suspect ACM. All suspect ACM observed was grouped into homogenous areas for sampling (i.e., items composed of the same material with the same color and texture).

Samples were collected of each homogenous area for laboratory analysis utilizing the prescribed sample collection methodology outlined by USEPA and NYSDOL as follows: three to nine samples were collected of each surfacing material depending upon the square footage of the material present; three samples were collected of each thermal system insulation (TSI); and two to three samples were collected of each miscellaneous material depending on the square footage of the material present. The samples of each homogenous area were collected from well distributed locations of the material and all layers of the material present were collected. The samples were collected in accordance with the procedures described in the NYSDOL's ICR 56. During sample collection, the suspect ACM was physically handled to determine friability. Only observed suspect ACM was sampled during the assessment. Following collection of each sample, the inspector noted the location from where each sample was collected on a sample location plan and added the sample identification to a Chain of Custody form.

The samples were sent to the laboratory for analysis by Polarized Light Microscopy (PLM) utilizing NYSDOH ELAP Method 198.1 for friable suspect materials, and Non-friable Organically Bound (NOB) PLM utilizing NYSDOH ELAP Method 198.6 for non-friable suspect materials. Confirmation analysis of NOB materials utilizing Transmission Electron Microscopy (TEM) was performed, where necessary, utilizing NYSDOH ELAP Method 198.4. TEM is required by the New York State Department of Health (NYSDOH) to prove that a NOB material is non-ACM, when the material is initially determined to be non-ACM by PLM and the sample has an acid insoluble inorganic phase of greater than 1.0%.

All samples were submitted to EMSL Analytical Inc. (EMSL) of Carle Place, New York for analysis. EMSL participates in the NYSDOH Environmental Laboratory Approval Program (ELAP).

3.2 Lead-Based Paint

A lead-based paint (LBP) survey was performed for the area of work in order to determine the locations, components, extent, substrate materials and condition of any LBP present. The survey was performed utilizing the applicable provisions of the USEPA and United States Department of Housing and Urban Development (HUD) standards.

According to HUD and USEPA, LBP is defined as a coating with a lead concentration greater than or equal to 0.5% or 5,000 parts per million (ppm) (also equivalent to milligrams per kilogram [mg/kg]) in a paint chip sample analyzed by a laboratory.

During the survey, accessible portions of the area of work were visually assessed to identify coated building components. The coated components were grouped by the same color, texture and substrate material. For the purposes of this assessment, the survey was performed utilizing paint chip sampling. One sample was collected of each coated building component for laboratory analysis. During sample collection, layers of the coating present were collected with the substrate material excluded. Following collection of each sample, the inspector noted the location from where each sample was collected on a sample location plan and added the sample identification to a Chain of Custody form.

The samples were sent to the laboratory for lead analysis by atomic absorption spectroscopy utilizing USEPA SW-846 Method 3050B/7000B.

All samples were submitted to EMSL Analytical Inc. (EMSL) of Carle Place, New York for analysis. EMSL participates in the NYSDOH Environmental Laboratory Approval Program (ELAP).

3.3 Polychlorinated Biphenyls

Polychlorinated biphenyls (PCBs) are a group synthetic chemical compounds known for their non-flammability, chemical stability, low volatility and electrical insulating properties. Due to these properties, PCBs were widely used in electrical, heat transfer and hydraulic equipment; as plasticizers in paints, plastics, caulks and rubber products; as pigments in dyes; as well as many other applications. PCBs were first synthesized in 1881 and, due to their toxicity and environmental persistence, their manufacture was prohibited by USEPA in 1977.

The Toxic Substances Control Act (TSCA) (40 CFR Part 761) regulates the management of PCBs at concentrations greater than or equal to 50 parts per million (ppm). Under TSCA, any equipment or material containing ≥50 ppm PCBs has specific handling, transportation, record

keeping and disposal requirements. Electrical equipment has specific requirements depending on the type of equipment and its PCB concentration. Other equipment and materials containing ≥50 ppm PCBs is generally termed "PCB Bulk Product Waste." However, if the electrical equipment or PCB Bulk Product Waste contaminates any other material via a spill, leaching, contact, etc., the impacted material is termed a "PCB Remediation Waste" and is regulated under TSCA if its PCB concentration is greater than or equal to 2 ppm.

In New York State, the NYSDEC regulates equipment and materials containing PCBs at concentrations of greater than or equal to 50 ppm as hazardous waste. The NYSDEC's regulations governing the identification of PCB hazardous waste are codified at 6 NYCRR Part 371.4(e), and the NYSDEC's regulations governing the management of PCB hazardous waste are codified at 6 NYCRR Parts 372 and 373.

It should be noted that an exemption for "small capacitors" is contained in both TSCA (40 CFR 761.60(b)(2)(ii)) and the New York State hazardous waste management regulations (6 NYCRR Part 371.4(e)(1)), which is applicable to fluorescent light ballasts. All fluorescent light ballasts contain small capacitors. If manufactured prior to 1978, these small capacitors typically contain PCBs at concentrations exceeding 50 ppm. As a result, based on this exemption, the regulations allow non-leaking ballasts to be managed as municipal solid waste. However, USEPA has determined that the ballast's potting material, the insulation that fills the space between the ballast and the outer metal shell, also contains PCBs at concentrations that can exceed 50 ppm in pre-1978 ballasts. Therefore, USEPA recommends that either the ballast be sampled to determine that its PCB concentration is less than 50 ppm allowing it to be managed as municipal solid waste, or assume the ballast contains ≥50 ppm PCBs and manage the ballast as PCB Bulk Product Waste. Since sampling can be costly, often the most cost-effective option is to simply manage ballasts as PCB Bulk Product Waste.

During the survey, all PCB and suspect PCB items observed were quantified and their locations noted on a floor plan. If it was determined that the item should be sampled for PCBs, the sample was sent to EMSL Analytical Inc. (EMSL) of Carle Place, New York for analysis utilizing USEPA SW-846 Method 8082.

3.4 Universal Waste

Due primarily to the presence of mercury and other metals in some commonplace building materials that would render them hazardous waste, the USEPA has created a category of waste referred to as "universal waste" to streamline the hazardous waste management standards and prevent generators of these materials from becoming traditional hazardous waste generators. The goal of this program is to ensure that these materials are properly managed and prevented from entering the environment without imposing the onerous requirements of the hazardous waste management regulations.

As a result, USEPA has specified, and NYSDEC has adopted, the identification of four categories of ubiquitous wastes for management as universal waste. These wastes include certain lamps (i.e., fluorescent, neon, high-intensity discharge, metal halide, sodium vapor and mercury vapor), batteries, mercury-containing equipment and certain pesticides. The regulations specifying the proper identification and management of universal waste are codified in the federal regulations at 40 CFR Part 273 and in the New York State regulations at 6 NYCRR Part 274-3.

During the survey, all universal waste observed was quantified and its location noted on a floor plan. Samples were not collected of universal waste during the survey for laboratory analysis.

3.5 Refrigerant-Containing Equipment

Many different chemical compounds used as refrigerants in commercial and industrial refrigerant containing equipment are classified as chlorofluorocarbons (CFCs). CFCs gained notoriety due their persistence in the environment coupled with their ability to efficiently destroy ozone in the upper atmosphere, which has led to the depletion of the ozone layer. As a result of the depletion of the ozone layer, USEPA established the refrigerant recycling rule under Section 608 of the Clean Air Act.

The USEPA's regulations describing the requirements for refrigerant recycling are codified at 40 CFR Part 82. These regulations require that CFCs be recovered and recycled from all equipment in which they are present during any maintenance activities and prior to any disposal activities.

In addition, USEPA has identified some refrigerants as hazardous waste in the event the refrigerants are disposed rather than recycled. The regulations specifying the proper identification and management of certain refrigerants as hazardous waste are codified in the federal regulations at 40 CFR Parts 260 through 268 and in the New York State regulations at 6 NYCRR Parts 370 through 376.

During the survey, all refrigerant-containing equipment observed was quantified and its location noted on a floor plan. In addition, an attempt was made during the survey to identify the type of refrigerant present in the equipment by reading the equipment nameplate and other information provided on the equipment itself. Samples were not collected of refrigerant during the survey for laboratory analysis.

3.6 Chemical and Petroleum Products

Chemical and petroleum products have the ability to adversely impact human health and/or the environment if not properly managed. As a result, unwanted chemical and petroleum products present in containers and/or tanks should be properly managed prior to any renovation or demolition activities.

Certain chemical and petroleum products can be considered hazardous waste at the time of disposal. The regulations specifying the proper identification and management of hazardous waste are codified in the federal regulations at 40 CFR Parts 260 through 268 and in the New York State regulations at 6 NYCRR Parts 370 through 376.

Many petroleum products are considered used oil by the USEPA and NYSDEC. The regulations specifying the proper identification and management of used oil are codified in the

federal regulations at 40 CFR Part 279 and in the New York State regulations at 6 NYCRR Part 374-2.

Even if a chemical or petroleum product is not identified as either hazardous waste or used oil, certain management procedures should be employed to prevent contaminating the environment or triggering a reportable quantity (RQ) under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), the Emergency Planning and Community Right-to-Know Act (EPCRA) or the Chemical Bulk Storage (CBS) regulations. As a result, these materials should be managed as hazardous materials and properly disposed or recycled at an appropriate off-site facility.

During the survey, the chemical and petroleum products observed were quantified and their locations noted on a floor plan. In addition, an attempt was made during the audit to identify the type of product present in the container by reading the label provided on the equipment itself. Also, if the container was observed to be leaking, the approximate area of floor impacted by the spill was noted during the audit. Samples were not collected of any chemical or petroleum product during the survey for laboratory analysis.

3.7 Miscellaneous Items, Materials and Equipment

Although not included in any of the categories identified above, some miscellaneous items, materials and equipment commonplace in construction require special handling at the time of disposal, rather than management as construction and demolition debris (C&D). These materials should be removed prior to any planned demolition activities and properly managed. Since the waste management requirements for these items will depend on the specific item, recommendations for the proper management of these items, if identified on-site, is included in the recommendations section of this report (see Section 6.0).

During the survey, all miscellaneous items, materials and equipment observed were quantified and their locations noted on a floor plan. In addition, an attempt was made during the audit to identify the type of item, material or equipment observed by reading the equipment nameplate and other information provided on the equipment itself. The nameplate was also

consulted to determine whether the item, material or equipment contains any chemical or any other material that may be harmful to human health or the environment. Samples were not collected of any item, material or equipment during the survey for laboratory analysis.

4.0 FINDINGS

The sections that follow present the findings of the limited hazardous materials survey based on the field inspection and laboratory analytical results. The extents of this hazardous materials survey are limited to only those areas where work is proposed under the plant upgrade project, as described in Section 2.0 of this report.

It should be noted that certain materials were not sampled during this assessment due to safety and operational concerns. These materials include: the suspect underlayment beneath the terrazzo flooring on the main floor; the live electrical wiring throughout the area of work; the backer board/transite panel suspected in the electrical cabinets on the main floor; the vibration dampening cloth observed on the exhaust units on the sub-basement level; and, the gasket material associated with the pumps, motors and piping observed on the main floor, basement, sub-basement and pit level of the Main Building.

4.1 Asbestos-Containing Materials

A total of 30 bulk samples were collected of 10 homogeneous areas from the area of work. The bulk samples were analyzed via PLM or NOB PLM for asbestos content and, if the results of the NOB PLM analysis were inconclusive, were further analyzed by TEM. A table summarizing the asbestos bulk sample results is provided as Table B-1 in Appendix B. The laboratory data packages and Chain of Custody records for the samples are provided in Appendix C. Asbestos bulk sample location plans are provided as Figures D-1 through D-4 in Appendix D.

Based on the analyses, one homogeneous area was identified as ACM (i.e., the sample's analytical results indicated asbestos at a concentration greater than 1% by weight). In addition, the following materials not sampled due to safety and operational concerns were assumed to be ACM: the suspect underlayment beneath the terrazzo flooring on the main floor; the live electrical wiring throughout the area of work; the backer board/transite panel suspected in the electrical cabinets on the main floor; the vibration dampening cloth observed on the exhaust units on the sub-basement level; and, the gasket material associated with the pumps, motors and piping

observed on the main floor, basement, sub-basement and pit level of the Main Building. ACM location plans are provided as Figures E-1 through E-5 in Appendix E. The following table summarizes the materials identified as ACM:

SUMMARY OF REGULATED ASBESTOS-CONTAINING MATERIALS			
Homogenous Area	**Location**	**Asbestos content (%)**	**Approximate Quantity***
Cementitious Pipe Insulation Fitting/ Elbow	Basement - 2-inch Diameter Green Pipe	2.15% Chrysotile	Field Verify
Suspect Underlayment beneath the Terrazzo Flooring	Main Floor	Assumed	6,000 SF
Vibration Dampening Cloth on Exhaust Units	Sub-Basement	Assumed	Field Verify
Gasket Material associated with the Pumps, Motors and Piping	Main Floor, Basement, Sub-Basement and Pit Level	Assumed	Field Verify
Backer Board/Transite Panel Suspected in the Electrical Cabinets	Main Floor	Assumed	Field Verify
Live Electrical Wiring	Main Floor, Basement, Sub-Basement and Pit Level	Assumed	Field Verify

* Quantities are estimated and should be verified by the contractor prior to bidding or abatement.
SF = square feet, LF = linear feet.

4.2 Lead-Based Paint

Paint chip samples were collected of 21 different building components from the area of work. A table summarizing the paint chip sample lead results is provided as Table B-2 in Appendix B. The laboratory data packages and Chain of Custody records for the samples are

provided in Appendix C. Paint chip sample location plans are provided as Figures D-1, D-2, D-4 and D-5 in Appendix D.

Based on the analyses, five components were identified as lead-based paint (i.e., the sample's analytical results indicated lead at a concentration greater than 0.5% by weight). The following table summarizes the building component identified as lead-based paint:

SUMMARY OF LEAD-BASED PAINT				
Building Component	**Location**	**Color**	**Substrate**	**Lead Content**
Pump	Main Floor - Exterior of Pump A-3	Light Beige	Metal	0.743%
Staircase	Basement - Underside of the Staircase	Beige	Metal	4.66%
Pump	Sub-basement - Exterior of Pump A-3	Grey	Metal	0.988%
Rotating Shaft	Sub-Basement - Rotating Shaft for Pump A-4	Red	Metal	7.232%
Pipe	Pit Level - 48" Diameter Pipe	Grey	Metal	0.554%

4.3 Polychlorinated Biphenyls

The only potential polychlorinated biphenyl (PCB) containing material observed within the area of work was the hydraulic oil contained in the 500-gallon steel aboveground storage tank located on the basement level of the Main Building. In order to determine whether the oil contains PCBs at a concentration in excess of the regulatory level of 50 ppm, a sample was collected of the oil for PCB analysis to ensure that the oil is properly managed once removed. A table summarizing the PCB sample result is provided as Table B-3 in Appendix B. The laboratory data package and Chain of Custody record for the sample are provided in Appendix C. A PCB sample location plan for the basement level of the Main Building is provided as Figure D-2 in Appendix D.

As indicated in Table B-3, PCBs were detected in the hydraulic oil sample at a concentration below the USEPA Toxic Substances Control Act (TSCA) and New York State Department of Environmental Conservation (NYSDEC) PCB regulatory level of 50 ppm.

4.4 Universal Waste

Based on the on-site survey, universal waste was not identified within the area of work.

4.5 Refrigerant-Containing Equipment

Based on the on-site survey, refrigerant-containing equipment was not identified within the area of work.

4.6 Chemical and Petroleum Products

Based on the on-site survey, chemical products were not identified within the area of work. However, the following petroleum product was identified within the area of work:

SUMMARY OF PETROLEUM PRODUCTS		
Description	**Location**	**Quantity**
Hydraulic Oil System and Tank	Basement Level of the Main Building	500 gallons

* Quantities are estimated and should be verified by the contractor prior to bidding.

4.7 Miscellaneous Items, Materials and Equipment

Based on the on-site survey, the following miscellaneous items, materials and equipment that are of concern from a hazardous materials perspective were identified within the area of work within the Main Building:

SUMMARY OF MISCELLANEOUS ITEMS, MATERIALS AND EQUIPMENT		
Description	**Location**	**Quantity**
Suspect Dismantled Chemical Feeder System (a label on the unit indicated "T-5 Bldg. H Grade Floor")	Main Floor North and Southwest of Pump A-6	1

5.0 CONCLUSIONS

D&B completed a limited hazardous material assessment for the area of work (as defined in Section 2.0 of this report) located within the Main Building of the Nassau County Cedar Creek WPCP at 3340 Merrick Road in Wantagh, New York. The results of the survey are provided below.

Asbestos-Containing Materials

The results of the samples collected indicate that the following material is considered to be ACM:

- The cementitious pipe insulation fitting/elbow on the 2-inch diameter green pipe located on the basement level within the Main Building.

In addition, the following materials were assumed to be ACM since they could not be sampled during the survey due to the aforementioned limitations:

- Suspect underlayment beneath the terrazzo flooring on the main floor of the Main Building.
- The backer board/transite panel suspected in the electrical cabinets on the main floor of the Main Building.
- The live electrical wiring on the main floor, basement, sub-basement and pit level of the Main Building.
- The vibration dampening cloth observed on the exhaust units on the sub-basement level of the Main Building.
- Gasket material associated with the pumps, motors and piping observed on the main floor, basement, sub-basement and pit level of the Main Building.

Lead-Based Paint

The result of the paint chip samples collected indicate that the following coatings are considered to be lead-based paint:

- The light beige paint on the exterior of Pump A-3 on the main floor.
- The beige paint on the underside of the staircase on the basement level.
- The grey paint on the exterior of Pump A-3 on the sub-basement level.
- The red paint on the rotating shaft for Pump A-4 on the sub-basement level.
- The grey paint on the 48-inch diameter pipe on the pit level of the Main Building.

Polychlorinated Biphenyls

PCBs were detected in the hydraulic oil sample collected from the hydraulic oil tank on the basement level of the Main Building at a concentration below the USEPA TSCA and NYSDEC PCB regulatory level of 50 ppm. As a result, this oil does not require special management under the TSCA or NYSDEC hazardous waste management regulations.

Universal Waste

Universal waste was not identified within the area of work.

Refrigerant-Containing Equipment

Refrigerant-containing equipment was not identified within the area of work.

Chemical and Petroleum Products

Chemical products were not identified within the area of work. However, the following petroleum product was identified within the area of work:

- The approximate 500 gallons of hydraulic oil contained in the hydraulic oil system and tank located in the basement level of the Main Building.

Miscellaneous Items, Materials and Equipment

The following miscellaneous items, materials and equipment were observed within the area of work:

- A suspect dismantled chemical feeder system located on the main floor north and southwest of Pump A-6 (a label on the unit indicated “T-5 Bldg. H Grade Floor”).

6.0 RECOMMENDATIONS

The following recommendations are presented based on the conclusions of the limited hazardous materials survey as presented in Section 5.0 of this report.

6.1 Asbestos-Containing Materials

Prior to performing any future demolition or renovation activities in the area of work, all ACM affected by the planned activities should be removed and managed in accordance with the USEPA National Emission Standards for Hazardous Air Pollutants (NESHAPs) (40 CFR Part 61), New York State Department of Labor (NYSDOL) Industrial Code Rule 56 (ICR 56) and any applicable local regulations. A licensed and accredited asbestos abatement contractor must be utilized to perform the removal of all ACM identified within the area of work. Suspect ACM not sampled during this survey should be considered ACM until sampled and proven by laboratory analysis to be non-ACM. The USEPA and NYSDOL must be notified of this project prior to performing any asbestos removal activities.

During performance of the asbestos removal activities, the owner must retain an independent third-party contractor to conduct project monitoring and work area air sampling and analysis to ensure that the asbestos removal work is performed in accordance with Industrial Code Rule 56 and all other applicable regulations. The owner must obtain copies of the analytical results for all air samples collected for each specific project in order to document the airborne asbestos concentrations before, during and after the asbestos abatement activities. In addition, copies of all clearance asbestos air sampling analytical results must be submitted to the NYSDOL Division of Safety & Health, Asbestos Control Bureau, as required by Industrial Code Rule 56.

6.2 Lead-Based Paint

In the event that the materials identified as lead-based paint are demolished in the future, the demolition debris must be tested for lead, at a minimum, utilizing the Toxicity Characteristic Leaching Procedure (TCLP). If the TCLP analysis indicates lead at a concentration of 5 mg/L or

greater, then the debris must be managed as a hazardous waste in accordance with the USEPA Resource Conservation and Recovery Act (RCRA) regulations (40 CFR Parts 260 through 268) and the New York State Department of Environmental Conservation's (NYSDEC's) hazardous waste management regulations (6 NYCRR Parts 370 through 376). However, if the lead-based paint coated component is composed of metal, then the scrap metal exemption may be used and the component can be recycled in lieu of management as hazardous waste (records of the transportation and proper management of these items must be maintained).

In the event that the on-site building is renovated in the future and will be used as a "child-occupied facility," then the requirements of USEPA's Lead-Based Paint Renovation, Repair and Painting Program Rule must be followed. In addition, if the building will be voluntarily abated and used as a "child-occupied facility," then the abatement work must be conducted in accordance with USEPA and HUD requirements. Also, if the building is sold or leased for housing, then the owner must notify the buyer or lessee of the hazards of lead-based paint in accordance with USEPA's requirements. Lastly, if the building will be used for HUD housing, then a certified lead Risk Assessor should be consulted to determine whether the lead-based paint identified in this report must be abated in accordance with USEPA and HUD requirements.

Whenever work is performed that disturbs lead-based paint, workers must be protected in accordance with the United States Department of Labor Occupational Safety and Health Administration's (OSHA's) "Lead in Construction" Rule (29 CFR 1926.62).

6.3 Petroleum Products

The petroleum product (hydraulic oil) identified during this survey should be properly managed in the event that it is affected by any future renovation or demolition activities and will not be reused. The first step in disposal is to perform a waste determination for the oil in accordance with 40 CFR 261 and 6 NYCRR 371. A sample of the oil should be collected and analyzed for total halogens. If the oil has not been mixed with any other material, then additional testing should not be required unless requested by the disposal facility. If the total halogens content is less than 1,000 ppm, then the oil may be managed as used oil in accordance

with 40 CFR Part 279 and 6 NYCRR Part 374-2. If the total halogens content is greater than 1,000 ppm, then the oil must be managed as hazardous waste in accordance with 40 CFR 264 and 6 NYCRR 373. This oil should not be mixed with any other material or waste prior to disposal.

6.4 Miscellaneous Items, Materials and Equipment

All of the miscellaneous items, materials and equipment identified during this survey should be properly managed in the event that they are affected by any future renovation or demolition activities and will not be reused. The first step in disposal is to perform a waste determination on each item in accordance with 40 CFR 261 and 6 NYCRR 371. If a Safety Data Sheet (SDS) cannot be located for the item, a sample of the material should be collected and analyzed for flash point, pH, reactive sulfide, reactive cyanide and RCRA constituents by the Toxicity Characteristic Leaching Procedure (TCLP), as well as any additional parameters specified by the selected disposal facility. If determined to be hazardous waste, the waste should be managed at a facility authorized to manage hazardous waste in accordance with 40 CFR 264 and 6 NYCRR 373. If determined to be nonhazardous waste, the waste should be managed as nonhazardous waste at a facility approved to manage such waste.

Duly Authorized Representative – Richard M Walka:

This license has been issued in accordance with applicable provisions of Article 30 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project worksite. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

NOB = Non Friable Organically Bound N/A = Not Applicable VCM = Vermiculite Containing Material

-In New York State, TEM is currently the only method that can be used to determine if NOB materials can be considered or treated as non-asbestos containing.
All samples examined for the presence of vermiculite when analyzed via NYS 198.1.
-NYS Guidelines for Vermiculite containing samples are available at http://www.wadsworth.org/labcert/elapcert/forms/VermiculiteInterimGuidance_Rev070913.pdf
EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. Samples were received in good condition unless otherwise noted.
This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government. This report may contain data that is not covered by the NVLAP accreditation.

2/3/2017

The following analytical report covers the analysis performed on samples submitted to EMSL Analytical, Inc. on 1/27/2017. The results are tabulated on the attached data pages for the following client designated project:

3894-01A

The reference number for these samples is EMSL Order #011700742. Please use this reference when calling about these samples. If you have any questions, please do not hesitate to contact me at (856) 303-2500.

Approved By:

Phillip Worby, Chemistry Laboratory Manager

The test results contained within this report meet the requirements of NELAP and/or the specific certification program that is applicable, unless otherwise noted.
NELAP Certifications: NJ 03036, NY 10872, PA 68-00367, CA ELAP 187

The samples associated with this report were received in good condition unless otherwise noted. This report relates only to those items tested as received by the laboratory. The QC data associated with the sample results meet the recovery and precision requirements established by the NELAP, unless specifically indicated. All results for soil samples are reported on a dry weight basis, unless otherwise noted. This report may not be reproduced except in full and without written approval by EMSL Analytical, Inc.

RE: Geotechnical Data Report
Cedar Creek WPCP Expansion,
Wantagh, New York
MRCE #6102

Gentlemen:

Pursuant to your authorization, we have completed a subsurface exploration program at the Cedar Creek WPCP. The proposed expansion of the treatment plant comprises modification of existing structures and construction of new structures, while keeping the plant in operation. The purpose of the subsurface exploration program is to provide additional boring and laboratory test data for use in design of proposed structures and for use by contractors in preparing bids. The subsurface exploration program included a pumping test which is summarized in our March 18, 1985, report titled "Pumping Test Data Report, Cedar Creek WPCP Expansion, Wantagh, New York".

This data report summarizes the field investigation and laboratory testing of soils. It includes an evaluation of subsurface conditions at the site. Some of the information in this report is also included in our March 18, 1985 report. Interpretation of the boring data, with respect to design and construction of proposed structures, is being presented in separate letters or reports.

Exhibits

The following exhibits are attached to illustrate site conditions and to summarize laboratory test data:

Plate No. 1P	Site Vicinity Map
Plate No. 1	Project Site Prior to Treatment Plant Construction
Plate No. 2P	Map of Surficial Geology
Plate No. 3P	Schematic Section

Drawing No. B-1	Boring Location Plan
Table No. 1	Survey Data for Borings
Drawing No. GS-1P	Geologic Section
Drawing No. GS-1	Geologic Sections A-A and B-B
Drawing No. GS-2	Geologic Sections C-C and D-D
Drawing No. GS-3	Geologic Sections E-E and F-F
Table No. 2	Summary of Laboratory Test Data
Plate No. 2	Soil Properties Profile, Borings Nos. B-312U and B-313U
Plate No. 3	Soil Properties Profile, Borings Nos. B-314U and B-317U
Plate No. 4	Consolidation Test, Boring No. 312U, Sample No. 5U
Plate No. 5	Consolidation Test, Boring No. 312U, Sample No. 6U
Plate No. 6	Consolidation Test, Boring No. 313U, Sample No. 5U
Plate No. 7	Consolidation Test, Boring No. 313U, Sample No. 7U
Plate No. 8	Consolidation Test, Boring No. 314U, Sample No. 5U
Plate No. 9	Consolidation Test, Boring No. 317U, Sample No. 4U
Plate No. 5P	Gradation Curves, Stratum S1
Appendix A	MRCE Boring Logs
Appendix B	MRCE Reclassification of Samples from 1983 Borings

Plates Nos. 1P, 2P, 3P, and 5P and Drawing No. GS-1P are taken from our March 18, 1985, report regarding the pumping test.

Available Information

You have provided us with the following data:

1. Converse Consultants report titled "Report of Soils and Foundation Investigation, Proposed Cedar Creek Plant Modifications, Wantagh, New York", dated 10 June, 1983.

2. Converse Consultants report titled "Report of Soils and Foundation Investigation, Cedar Creek Expansion, Wantagh, New York", dated 22 December 1983.

3. Driller's logs of borings made by W. M. Walsh Company, Inc., dated 1966.

4. Consoer, Townsend & Associates drawing titled "Subsurface Exploration", dated June 5, 1978, showing the location of Cedar Creek and shell midden mounds prior to treatment plant construction.

5. Portions of the contract drawings for construction of the treatment plant, titled "Department of Public Works, Nassau

County, New York, Sewage Disposal District No. 3, Water Pollution Control Plant, Contract Nos. 1002-3P-1, 2, 3 & 4", prepared by Consoer, Townsend & Associates, dated 1968.

Project Description

The treatment plant site in Wantagh, NY, is shown on the Site Vicinity Map, Plate No. 1P. The treatment plant site was formerly marshland on which hydraulic fill was reportedly placed between August 1968 and September 1969. Site conditions prior to filling are illustrated on Plate No. 1. This plan shows the location of old Cedar Creek, which meandered along the eastern side of the site. Also shown are the locations of three shell midden mounds, which are reportedly of Indian origin.

You have informed us that hydraulic sand fill was placed over the site in three 5-foot thick lifts. Perimeter dikes were constructed prior to placing the first two lifts, and placement of fill proceeded from south to north. Construction of plant structures began in 1969 and was completed in 1973. The Tertiary Treatment Building was added to the treatment plant between 1977 and 1980, and the Sludge Dewatering Building was added between 1981 and 1983. Final Sedimentation Tanks Nos. 4 and 6 were added in 1979.

The proposed modifications to the treatment plant will be constructed in several phases in order to maintain the plant in operation during construction. The proposed construction phases and the facilities to be constructed in each phase are summarized below:

Phase	New Structures
IIB	Diesel Maintenance Building Cold Storage Building Construction House
IID	Modify existing Digester Tanks
IIIA	Aeration Tanks R.A.S. Pump Station Final Sedimentation Tanks Nos. 9 to 14 Odor Control Facilities for the Primary Tanks, Grit Chambers, and Sludge Thickening Tanks
IV	Influent Screening Chamber Addition Grit Chambers and Building Primary Sedimentation Tanks Odor Control Building for Aeration Tanks R.A.S. Pump Station. Final Sedimentation Tanks Nos. 15 to 18 Sludge Thickening Tanks and Building Digester Tanks and Control Building

Geologic Conditions at Project Site and Vicinity

The treatment plant site was formerly marshland that was filled in the late 1960's just prior to construction of the plant. Upper Pleistocene outwash deposits underlie the Recent salt marsh deposits, and these in turn are underlain by the Magothy formation of Late Cretaceous age.

A map of southern Nassau and southeastern Queens Counties showing surficial geology in 1954 is presented on Plate No. 2P. The map is taken from Geological Survey Water-Supply Paper 1613-A, titled "Geology and Ground-Water Conditions in Southern Nassau and Southeastern Queens Counties, Long Island, N.Y.", by N.M. Perlmutter and J.J. Geraghty, 1963. The treatment plant site was indicated to be marshland in this 1954 map. The section shown on the map in the vicinity of the treatment plant is presented on Plate No. 3P, which is also taken from the Water-Supply Paper referenced above.

The section on Plate No. 3P indicates subsurface stratification in the vicinity of the treatment plant to comprise Upper Pleistocene deposits extending to about Elev. -35, underlain by the "20 foot" clay, which in turn is underlain by the Magothy formation. The "20 foot" clay is characterized as a shallow marine deposit, possibly of Wisconsin age. Recent marsh deposits and artificial fill are not delineated on the section. The treatment plant was located in the vicinity of the indicated transition between salt and fresh groundwater in the Pleistocene deposits. The location of this transition may have shifted since 1963, when the Water-Supply Paper was published. Groundwater in the Magothy formation was indicated to be fresh. Chemical analyses of groundwater samples obtained from the Pleistocene deposits were performed by Malcolm Pirnie, Inc., and indicate chloride concentrations of about 1070 ppm. Chemical analyses data included in the December 22, 1983, Converse Consultants report indicate groundwater chloride concentrations of about 440 to 660 ppm.

The water table was shown on Plate No. 3P to be between about Elev. +1 and +3 near the treatment plant site, sloping downward to the south towards the Great South Bay. In actuality, the groundwater in the Pleistocene deposits is not unconfined as indicated, but is at least somewhat confined by the Recent organic deposits encountered at about Elev. 0. Water in the artificial fill overlying the organic soil may be at a different level than groundwater in the Pleistocene deposits. Groundwater in the Magothy formation was indicated to be under slight artesian pressure, with a head of about Elev. +8.

Field Investigation

We prepared a boring plan and specifications for a subsurface exploration program at the site. The borings were located at planned structures to supplement and confirm subsurface information obtained in earlier investigations. Proposals for the work were requested from four boring contractors, two of whom declined to bid. With your approval, the contract was awarded to Warren George, Inc.

The borings were made between February 13, and February 28, 1985, under continuous inspection of MRCE Resident Engineer Mr. Ben Mukherjee. As part of the subsurface investigation, eight well point type piezometers were installed in Borings Nos. B-302P, B-315P, B-316P(A), B-317UP, B-318P(A), B-319P, B-320P, and B-325P. The piezometers were used to monitor groundwater levels during the pumping test. Undisturbed samples were obtained in four borings: B-312U, B-313U, B-314U, and B-317UP. The subscript "P" after a boring number indicates that a piezometer was installed in the borehole, subscript "U" indicates that undisturbed samples were obtained in the boring, and subscript "A" indicates that the boring was offset from its original drilled location because an obstruction was encountered.

The borings were made by two truck mounted drillings rigs. Borings in which piezometers were installed were advanced by driving casing; all other borings were advanced using drilling mud. Dry samples of soil were obtained by driving a 2 inch diameter split spoon sampler with a 140 pound hammer free falling 30 inches. Undisturbed samples were obtained using a fixed piston sampler. All soil samples were sent to our laboratory for reclassification and testing.

Subsurface Conditions at the Treatment Plant Site

Locations of 1985 borings are plotted on the Boring Location Plan, Drawing No. B-1. The locations of all known previous borings made at the treatment plant site are also shown on Drawing No. B-1. Coordinates and elevations of the 1985 borings were determined by treatment plant personnel and are summarized on Table No. 1. Elevations refer to Nassau County Datum, in which Elev. 0 is mean sea level at Sandy Hook, New Jersey. Ground surface at the treatment plant is generally about Elev. +13 to +20.

Boring logs with reclassified soil descriptions are attached as Appendix A of this report. We have also examined and reclassified soil samples from the 1983 borings, and our sample descriptions are attached as Appendix B. Our classification of individual soil samples may or may not agree precisely with that shown on driller's logs prepared by Warren George, Inc.

Subsurface conditions are illustrated on seven geologic sections shown on Drawings Nos. GS-1P, GS-1, GS-2, and GS-3. Drawing No. GS-1P is taken from our March 18, 1985 report regarding the pumping test. Boring data plotted on the geologic sections include standard penetration resistances and groundwater levels measured in the boreholes. Major existing and proposed structures are also shown.

General characteristics of subsurface strata as interpreted from borings made for the treatment plant are described in the following paragraphs in order of increasing depth:

Stratum F - Fill. Approximately 15 feet of hydraulic sand fill was placed in the late 1960's over natural organic deposits at the treatment plant site. The hydraulic fill is generally medium-compact to compact

gray and brown fine to medium sand with a trace of silt and gravel, classified as SP in the Unified Soil Classification System. Occasionally the fill is loose, particularly where it is backfill against existing structures.

Stratum O - Organic Silty Clay and Peat. Underlying the hydraulic fill is a natural deposit of stiff to medium dark gray organic silty clay and brown peat, with a trace of fine sand, and occasionally containing fine sand seams. The thickness of the organic stratum varies between approximately one and 15 feet and is generally greatest in the eastern part of the plant. Top of Stratum O is about Elev. 0. The 1966 borings indicate top of Stratum O at about Elev. +2. These higher elevations reflect existing conditions prior to placement of fill at the treatment plant. Placement of fill has resulted in compression of the organic soils, and top of Stratum O is now about Elev. 0. Organic soils were not encountered adjacent to some existing structures where they presumably were removed during earlier construction. A layer of shells was encountered at the top of Stratum O in Boring No. B-327. These shells are presumably part of the south shell midden mound, the location of which is shown on Plate No. 1. Natural water contents of the organic soils vary from 23 to 253 percent and average about 90 percent. Water contents are expressed as a percentage of dry weight. Water contents of undisturbed samples are listed in Table No. 2; water contents of split spoon samples are tabulated in Appendix A. Low water contents reflect high sand contents in the samples.

Stratum S and O - Sand Mixed with Organic Silty Clay. This stratum was encountered in many of the borings and comprises medium compact gray fine to medium sand intermingled with pockets and layers of organic silty clay. Where present, it is typically about two to five feet thick and is generally encountered above Elev. -10. In Boring No. B-324, this stratum is about 15 feet thick and extends to approximately Elev. -27; in Boring No. B-311, it is about seven feet thick and extends to approximately Elev. -17. Available information shown on Plate No. 1 indicates that these two borings were made within the former Cedar Creek channel.

Stratum S1 - Sand. This deposit is a medium compact gray fine to coarse sand with a trace of silt and gravel, classified as SP in the Unified Soil Classification System. It is generally 30 feet thick and extends to approximately elevation -35. Stratum S1 sands are Upper Pleistocene outwash deposits.

Stratum C - Silty Clay. Underlying the sand is a stiff to hard gray silty clay. This deposit is the "20 foot" clay. It is typically 20 feet or more in thickness. Natural water contents vary between 22 and 42 percent and average about 34 percent. Water contents of individual split spoon samples are tabulated in Appendix A.

Stratum S2 - Silty Sand. This stratum is predominantly a medium compact to very compact gray silty fine to medium sand, occasionally interbedded with silty clay and/or gravel. Stratum S2 is presumably part of the Magothy formation. It was encountered between about Elev.

-55 and -95. Driller's logs of borings made by W. M. Walsh Company, Inc., dated 1966, and boring logs prepared by Converse Consultants, dated 1983, indicate that Stratum S2 is underlain by about 10 feet of hard dark gray clay, which is interbedded with seams of coarse to fine sand.

Static Ground Water Levels

Groundwater levels measured in the 1985 borings are plotted on the geologic sections. Drilling mud was used to advance all 1985 borings except those in which piezometers were installed. The measured mud levels may not correspond precisely with the groundwater table. We have therefore relied primarily on piezometer readings to establish groundwater levels in the upper strata.

Static groundwater levels measured in piezometers positioned in Stratum S1 in the vicinity of the proposed Aeration Tanks are typically about Elev. +2. The piezometer in Boring B-319P has its intake in Stratum F, Fill, and indicates a water level at almost Elev. +3, about 1 foot higher than in Stratum S1. Water levels measured in existing Borings Nos. B-206 and B-206A also indicate that the water level in the fill is about 1 foot higher than in the underlying Stratum S1.

The December 22, 1983 Converse Consultants report notes that water levels in Stratum S1 as measured in widely spaced observation wells in August and September, 1983, drop from about Elev. +3 to Elev. +1 in a southeasterly direction. Water levels measured in 1985 appear to corroborate this trend.

Water level for the 100 year storm is reported to be Elev.+ 7.

Laboratory Testing

All split spoon samples recovered from borings were delivered to our laboratory where they were examined and reclassified. Natural water contents of fine grained soil samples were determined.

Eight 3-inch diameter undisturbed samples of Stratum O soil were recovered in Borings Nos. B-312U, B-313U, B-314U, and B-317UP and were shipped to our laboratory for examination and testing. These samples were subjected to Atterberg limits, triaxial compression, and consolidation testing. Tests were performed on both peaty and non-peaty samples to obtain a range of soil parameters for Stratum O. Test results are summarized in Table No. 2. Test results are also plotted relative to depth on Soils Properties Profiles, Plates Nos. 2 and 3. Natural water contents and Atterberg limits are plotted versus depth on the right panel of Plates Nos. 2 and 3; strength and preconsolidation data are plotted versus depth on the left panel of Plates Nos. 2 and 3. Data for individual consolidation tests are presented on Plates Nos. 4 through 9.

Atterberg limits were determined for each undisturbed sample. The data indicate that the organic soils are generally classified as OH and Pt in the Unified Soil Classification System. Measured liquid limits of

the organic soil samples vary from 90 to 309 percent and average about 170 percent. Corresponding plasticity indices vary from 42 to 128 percent and average about 80 percent. Natural water contents of the limit samples typically fall between the liquid and plastic limits.

Measured specific gravities of the organic soils vary between 1.96 and 2.67. The lower specific gravities reflect a high organic fiber content in the samples.

Unconsolidated-undrained triaxial compression tests were performed on all undisturbed samples. Measured compressive strengths range from 0.4 to 1.7 tons per square foot. Measured strengths tend to increase with depth. The higher strengths were measured in samples that contained a large percentage of peaty fibers.

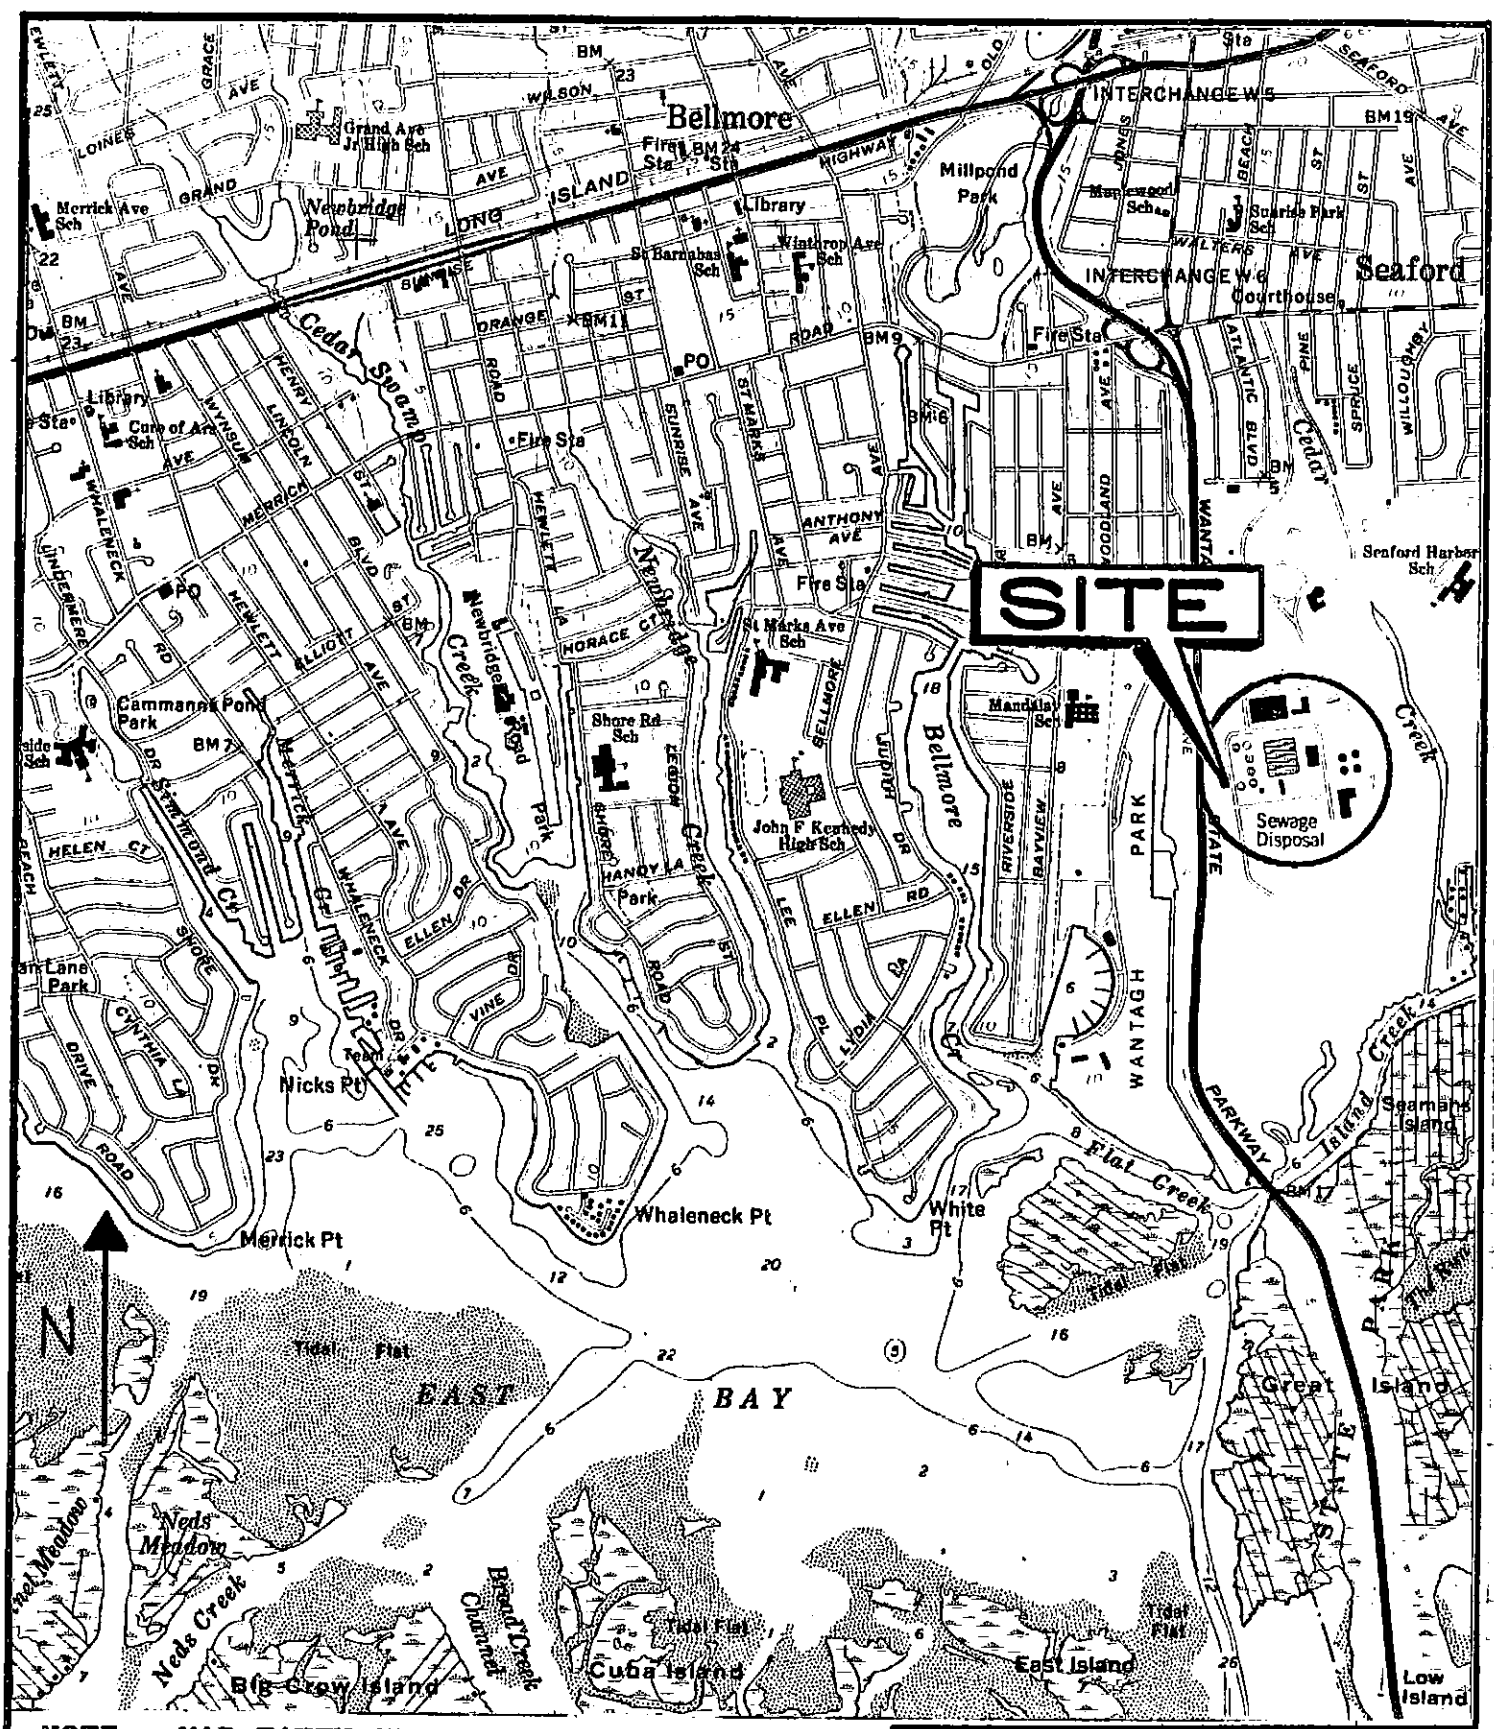
Consolidation test data indicate that Stratum O is overconsolidated by about 0.4 to 1.1 tons per square foot in excess of existing soil overburden stresses. Available site history data do not indicate surcharging in excess of existing soil overburden stresses. We believe that the high measured preconsolidation stresses may be the result of a combination of factors, including temporary stockpiling of equipment or excavated soil during plant construction, dewatering during previous construction, and a higher sand unit weight when saturated during hydraulic fill placement. The undisturbed sample borings are located near major existing structures, and it appears likely that temporary stockpiling during previous construction may be a significant contributing factor to the high measured preconsolidation stress. It is noted, however, that the preconsolidation of the organic soils may be lower in other areas of the treatment plant that are farther from previous construction and in which undisturbed samples were not obtained.

Five typical gradations of Stratum S1 sand are shown on Plate No. 5P. Superposed on Plate No. 5P is the range of gradations of Stratum S1 sand taken from the December 22, 1983, Converse Consultants report. The data indicate that Stratum S1 is generally fine to coarse or fine to medium sand with a trace of gravel and silt.

Summary and Conclusions

A boring investigation was made at the Cedar Creek WPCP to provide additional subsurface and laboratory test data for use in design of the proposed expansion of the treatment plant. As part of the investigation, a pumping test was performed in Stratum S1 to evaluate aquifer characteristics and the effects of construction dewatering on existing structures. Pumping test data are summarized in our March 18, 1985, report titled "Pumping Test Data Report, Cedar Creek WPCP Expansion, Wantagh, NY". This geotechnical data report, our March 18, 1985, pumping test report, and all other subsurface data and reports should be made available to contractors for their use in preparing bids.

This report is intended only to summarize data from the 1985 subsurface investigation. Interpretation of this information with respect to design and construction of new structures is being presented



in separate letters or reports. Subsurface conditions revealed by the 1985 borings generally corroborate boring data from earlier subsurface investigations.

Very truly yours,

EXPLANATION

Recent

Qaf — Artificial fill
Made land; mostly sand and gravel but includes some cinders and rubble

Qsm — Salt-marsh deposits
Chiefly organic mud, some silt and sand, are rarely less than 10 feet thick. Saturated with salty water. Not a source of water

Qsh — Shore deposits
Mainly beach sand and coarse sand, medium- to coarse-grained; scattered shell fragments. Contains thin lenses of fresh water underlain by salt water, relatively permeable but only small water supplies developed locally

Pleistocene — Wisconsin stage

UPPER PLEISTOCENE DEPOSITS

Qt — Till
Clay, sand, gravel, and boulders. Permeability generally low. Not a source of water

Qo — Outwash
Includes Recent alluvium along stream channels. Chiefly medium- to coarse-grained sand and some gravel deposited by glacial melt water; well stratified, crossbedding common. Highly permeable, yields large supplies to individual wells. Contains mostly fresh water but near the shore contains salt water

NOTE:

THE ABOVE ELEVATIONS AND COORDINATES WERE PROVIDED BY CEDAR CREEK WPCP PERSONNEL. ELEVATIONS REFER TO NASSAU COUNTY DATUM, IN WHICH ELEVATION 0.0 IS MEAN SEA LEVEL, SANDY HOOK, N.J.

CEDAR CREEK WPCP
MRCE NO. 6102

Note: Borings shown are plotted at radial distance from Well.

SECTION THROUGH PUMP WELL

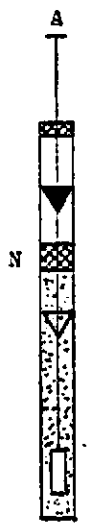
GENERAL STRATA DESCRIPTIONS

(F) FILL-COMPACT TO LOOSE GRAY AND BROWN FINE TO MEDIUM SAND, TRACE SILT, GRAVEL.

(O) ORGANIC SILTY CLAY AND PEAT-STIFF TO MEDIUM DARK GRAY ORGANIC SILTY CLAY AND BROWN PEAT, TRACE TO SOME FINE SAND.

(S & O) SAND MIXED WITH ORGANIC SILTY CLAY-MEDIUM COMPACT GRAY FINE TO MEDIUM SAND WITH SOME TO TRACE DARK GRAY ORGANIC SILTY CLAY POCKETS AND LAYERS.

(S1) SAND-MEDIUM COMPACT GRAY FINE TO MEDIUM SAND, TRACE TO SOME COARSE SAND, TRACE GRAVEL, SILT.



(C) CLAY-HARD TO STIFF GRAY SILTY CLAY, TRACE FINE SAND.

(S2) SILTY SAND-MEDIUM COMPACT TO VERY COMPACT GRAY SILTY FINE TO MEDIUM SAND, OCCASIONALLY INTERBEDDED WITH SILTY CLAY AND/OR GRAVEL.

NOTES:

1. BORINGS SHOWN ARE ONLY THOSE PIE METER HOLES USED DURING THE PUMP TEST. OTHER BOR GS ARE NOT SHOWN.
2. FOR BORING LOCATION PLAN AND GEN AL NOTES, SEE DWG, NO. B-1.
3. ADDED STANDARD PENETRATION RESIS NCES AND REVISED GENERAL STRATA DESCRIPTIONS AND TES.

LEGEND

A NUMBER, TYPE AND LOCATION OF BORING.

N STANDARD PENETRATION RESISTANCE.

(PU) PUSHED UNDISTURBED SAMPLE)

IMPERVIOUS SEAL.

SAND FILTER SURROUNDING PIEZOMETER INTAKE POINT.

PIEZOMETER INTAKE POINT.

STATIC WATER LEVEL BEFORE START OF PUMPING TEST.

DRAWNDOWN WATER LEVEL AT END OF PUMPING TEST.

STRATA DESCRIPTION

STRATUM ⓪ - Medium to stiff dark gray organic silty clay and brown peat, trace fine sand.

NOTES

1. All tests summarized were performed in the soil laboratory of Mueser Rutledge Consulting Engineers.
2. The sample elevation is the average of the sampling interval.
3. Ground surface elevations at borings are:

BORING NO.	ELEVATION FT.	BORING NO.	ELEVATION FT.
312U	14.4	314U	18.3
313U	16.1	317U	16.1

NOTES

4. "Average natural water content" is a weighted average of all material types recovered.
5. Compression tests performed were;
   UNC - Unconfined Compression
   UU - Unconsolidated Undrained Triaxial Compression
6. Strength tests were performed on samples approximately 2.8 inches in diameter with a height-to-diameter ratio of 2, at a rate of strain of approximately 1% per minute.
7. Compression Index, C_c = the slope of the virgin curve (straight line portion of the consolidation test e-log p plot).
   $e_2 = e_1 - C_c \times \log (P_2/P_1)$
8. Swelling Index, C_s = the slope of the rebound curve of the consolidation test.
   $e_2 = e_1 + C_s \times \log (P_1/P_2)$

APPENDIX A

Boring Logs

GENERAL STRATA DESCRIPTIONS

(F) FILL-COMPACT TO LOOSE GRAY AND BROWN FINE TO MEDIUM SAND, TRACE SILT, GRAVEL.

(O) ORGANIC SILTY CLAY AND PEAT-STIFF TO MEDIUM DARK GRAY ORGANIC SILTY CLAY AND BROWN PEAT, TRACE TO SOME FINE SAND.

(S) & (O) SAND MIXED WITH ORGANIC SILTY CLAY-MEDIUM COMPACT GRAY FINE TO MEDIUM SAND WITH SOME TO TRACE DARK GRAY ORGANIC SILTY CLAY POCKETS AND LAYERS.

(S1) SAND-MEDIUM COMPACT GRAY FINE TO MEDIUM SAND, TRACE TO SOME COARSE SAND, TRACE GRAVEL, SILT.

(C) CLAY-HARD TO STIFF GRAY SILTY CLAY, TRACE FINE SAND.

(S2) SILTY SAND-MEDIUM COMPACT TO VERY COMPACT GRAY SILTY FINE TO MEDIUM SAND, OCCASIONALLY INTERBEDDED WITH SILTY CLAY AND/OR GRAVEL.

DRILLER MIKE IMPARATO HELPERS JAKE HARRIS, JR.
REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-14-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-19-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

DRILLER MIKE IMPARATO HELPERS JAKE HARRIS, JR.
REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-23-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-26-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-14-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, rscovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-15-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

MUESER, RUTLEDGE, JOHNSTON & DESIMONE

REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-22-85

NOTES:
1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

BORING No. B-327

APPENDIX B

MRCE Reclassification of Samples from 1983 Borings

NOTE

1983 borings (200-series) were made in August and September, 1983. Samples were reclassified by MRCE in February 1985, about 18 months after the borings were made. Measured water contents are probably lower than in-situ values due to the age of the samples.

NOTE

1983 borings (200-series) were made in August and September, 1983. Samples were reclassified by MRCE in February 1985, about 18 months after the borings were made. Measured water contents are probably lower than in-situ values due to the age of the samples.

BORING CONTRACTOR WARREN GEORGE, INC.
DRILLER MIKE IMPARATO HELPERS JAKE HARRIS, JR.
REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-14-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

RESIDENT ENGINEER BEN MUKHERJEE DATE 2-14-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-21-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS

RESIDENT ENGINEER GERALD C. BRAUN DATE 2-18-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

CORE DRILLING IN ROCK, LIN. FT. . OTHER PIEZOMETER

BORING CONTRACTOR WARREN GEORGE, INC.
DRILLER MIKE IMPARATO HELPERS JAKE HARRIS JR.
REMARKS
RESIDENT ENGINEER GERALD C. BRAUN DATE 2-18-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER BEN MUKHERJEE DATE 2-27-85

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER GERALD C. BRAUN DATE 6-3-86

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER GERALD C. BRAUN DATE 6-14-86

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water, including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

REMARKS
RESIDENT ENGINEER JOSEPH DUMINUCO DATE 1-15-87

NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

CORE DRILLING IN ROCK, LIN. FT. . OTHER

BORING CONTRACTOR SOIL MECHANICS DRILLING CORP
DRILLER Al Fay HELPERS Angelo Armine
REMARKS
RESIDENT ENGINEER JOSEPH DUMINUCO DATE 2-21-87
NOTES:

1. Make a separate log of each boring and each unsuccessful attempt. Keep a copy of all logs in the field.
2. In daily progress column indicate depth at beginning and end of work day, calendar date, time at beginning and end of work day and weather conditions.
3. All samples shall be numbered in consecutive order regardless of type; dry samples D, wash samples W, shelby tube samples S, fixed piston samples U. Do not assign numbers to lost samples but record blows and reasons for lack of recovery.
4. Mark each U-sample with boring number, sample number, depth, recovery and job number.
5. Record blows on sampler per six inches of penetration. Note all blows and penetrations when taken at less than six inch intervals. Indicate method by which penetration of tube sampler was obtained.
6. Indicate changes of material in strata column and list generalized strata description.
7. List under remarks the manner by which changes in material were detected, all obstructions, any loss or gain of wash water including amount, the recovery of rock core in feet and inches and per cent of run, Rock Quality Designation (RQD) in per cent and any unusual occurrences.
8. Include sample description by Unified Soil Classification System.
9. Obtain water level at the beginning of each day and at all other times when stable water conditions exist.

Appendix F Release and Waiver

THIS PAGE INTENTIONALLY LEFT BLANK.

COUNTY OF NASSAU

STATE OF NEW YORK

DEPARTMENT OF PUBLIC WORKS

RELEASE AND WAIVER

In consideration of the Work as part of the Project, herein referred to as the "Project", more specifically the use of the existing monorails and hoists located at the facility for the loading and unloading of materials and equipment or any other County owned equipment used by the Contractor during the performance of the Work, the Contractor shall assume full responsibility as it relates to the use of the monorails, hoists or other Owner owned equipment and any subsequent damage to materials, equipment and/or injury to personnel thereto, and does hereby agree on behalf of themselves, their heirs, successors and assigns, subcontractors and any third parties who may have claim by, through or against the Contractor, to forever release and discharge the County of Nassau, its officials, representatives, employees, agents, successors and assigns, and CDM Smith, Inc. from any and all claims, obligations, demands, causes of action, agreements, promises, variances, fees, costs and damages whatsoever, which the Contractor has or may have which relate in any way to the use of any of the monorails, hoists or any other County owned equipment used by the Contractor in performance of the Work located at the County Facilities, including without limitation failure or inoperability of the equipment while in use by the Contractor during performance of the Work.

IN WITNESS WHEREOF, Contractor has executed this Release and Waiver on _____.
